1 At the Capitol of the United States in the city of Washington and District of Columbia, being the present seat of the National Government of the United States, on the second Monday of October (being the ninth day of the same month) in the year of our Lord one thousand eight hundred and ninety nine, and of the Independence of the United States the one hundred and twenty-fourth, the Supreme Court of the United States met agreeably to law.

2 And afterwards, to wit, on the 17th day of January, A. D. 1900, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.

Mr. Edward C. Crow, of counsel for the complainant, submitted to the consideration of the court a motion for leave to file a bill of complaint herein

Which said motion is in the words and figures following, viz:

3 In the Supreme Court of the United States. In Equity.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY DISTRICT OF CHICAGO, Defendants.

Now comes the complainant, The State of Missouri, by Edward C. Crow, its attorney general, and B. Schnurmacher, its counsel, and moves the court for leave to file and to present the accompanying bill of complaint.

EDWARD C. CROW,
Attorney General.

B. SCHNURMACHER, Counsel.

4 And afterwards, to wit, on the 22d day of January, A. D. 1900, the following order appears of record, viz:

Supreme Court of the United States, October Term, 1899.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY DISTRICT OF CHICAGO.
No. 7, Original.

On consideration of the motion for leave to file a bill of complaint herein, it is now here ordered by the court that said motion be, and

the same is hereby, granted, and that subpœnas returnable
5 on Monday, April 2d next be issued and served herein.

January 22, 1900.

(Endorsed :) Supreme Court U. S. No. 7, original. October term, 1899. Order. Filed January 22, 1900.

And on the same day, to wit, on the 22d day of January, A. D. 1900, the bill of complaint was filed in the words and figures following, viz:

6 Supreme Court of the United States, October Term, 1899.

THE STATE OF MISSOURI, Complainant, *vs.* THE STATE OF ILLINOIS and THE SANITARY District of Chicago.	No. 7, Original.

Bill of Complaint.

Edward C. Crow, attorney general of Missouri.
B. Schnurmacher, of counsel.

7 In the Supreme Court of the United States.

THE STATE OF MISSOURI, Complainant, *vs.* THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.	In Equity. Bill for Injunction.

To the honorable the Chief Justice of the United States and the associate justices of the Supreme Court of the United States:

The complainant, The State of Missouri, and one of the States of the United States, brings this its bill of complaint against The State of Illinois, one of the States of the United States, and The Sanitary District of Chicago, a public corporation, organized under the laws of the State of Illinois, and located in part in the city of Chicago and in the county of Cook, in said State of Illinois, and a citizen of the State of Illinois.

And your orator complains and says that it is a State containing a population of upwards of three millions of people, and lying on the west bank of the Mississippi river, a public, navigable, and running stream, and having a frontage on said stream of over four hundred miles.

And your orator shows that by the act of Congress providing for the organization and admission of Illinois and Missouri as States of the Union it was declared that the western boundary of Illinois and the eastern boundary of Missouri should be the middle of the main channel of the Mississippi river; that the shores of the Mississippi river, where its waters form the Missouri and Illinois boundary, and the soil under the waters thereof were not granted by the Constitution to the United States, but were reserved to the States of Illinois and Missouri respectively.

And your orator shows that the States of Missouri and
8 Illinois each have concurrent general jurisdiction over the
waters of the Mississippi river forming the boundary between them, and each of said States has exclusive territorial jurisdiction over that portion adjacent to its own shore, and your orator shows that the Illinois river empties into the Mississippi river at a point above the city of St. Louis, on the Illinois side of said Mississippi river.

And your orator further shows that within the territory of your orator and on the banks and shores of said Mississippi river and below the mouth of the Illinois river are many cities and towns in the State of Missouri, and many thousands of persons who are compelled to and do rely upon the waters of said river, in their regular, natural, and accustomed flow, for their daily necessary supply of water for drinking and all other domestic and agricultural and manufacturing purposes, and for watering stock and animals of all kinds, and that said Mississippi river has been flowing in its regular course and has been used for the purposes aforesaid by the inhabitants of the said State of Missouri for a time whereof the memory of man runneth not to the contrary, and that said river and its waters and the use thereof for drinking, agricultural, and manufacturing purposes, in their accustomed and natural flow, are indispensable to the life and health and business of many thousands of the inhabitants of the State of Missouri and of great value to your orator as a State.

And your orator shows that cities and towns below the mouth of said Illinois river, within the territory of your orator, do and are compelled, by means of water works, water towers, and intakes, built and constructed for that purpose, to supply the inhabitants of said cities and towns with an adequate supply of pure and wholesome water, fit and healthful for drinking and all other domestic purposes and uses, from the said Mississippi river so flowing in its ancient, accustomed, and natural course.

And your orator shows that said water-works systems are
9 constructed with reference to said Mississippi river and for
the purpose of taking water therefrom and not from any other source.

And your orator shows that heretofore, to wit, in 1889, the State of Illinois enacted a law known as the sanitary district act, together with an act for the improvement of the Illinois and Des Plaines rivers, and that under said act of said State the said corporation known as the said Sanitary District of Chicago was organized and is now existing and operating, and that by the express terms of said act any canal or drain corporation organized in accordance with its provisions may have conditions, restrictions, or additional requirements placed on said corporation, or the act authorizing the creation of said corporation may be amended or repealed, and that by the express provisions of said act, before any water or sewage shall be admitted into any channel constructed under said act, the trustees of said channel shall notify the governor of Illinois of the completion of said channel, and the governor of Illinois shall appoint three commissioners to examine said canal or channel and report to the governor if the same complies with the act of the State of Illinois; and if it does, the governor shall authorize the water and sewage to be turned into said channel; and that without the said permit it cannot be so turned in; and that by the general provisions of said act said channel is at all times subject to the control and supervision of the State of Illinois and her authorities.

And your orator further shows that the Chicago river is situated in the basin of Lake Michigan and has two forks or branches flowing through the city of Chicago and into Lake Michigan, and that the natural drainage of Chicago, Illinois, is into Lake Michigan, and the sewage and drainage of the territory embraced in the defendant's district, The Sanitary District of Chicago, is led into or flows into the Chicago river and Lake Michigan.

10 And your orator further shows that the defendant herein, The Sanitary District of Chicago, with the authority of the State of Illinois, and acting as a governmental agency of said State, and under the supervision and control and subject to the approval of the State of Illinois, has constructed a channel or open drain from the West fork of the South branch of the Chicago river, in the city of Chicago and county of Cook, in the State of Illinois, to a point near Lockport, in the county of Will, in said State, where said channel or drain connects with and empties into the Des Plaines river, which empties into the Illinois river, and which latter river flows and empties into the Mississippi river at a point distant about forty-three miles above the city of St. Louis, Missouri.

And your orator further states that the channel built by the Sanitary District of Chicago was so built by said Sanitary District as one of the governmental agencies of the State of Illinois, and by the pretended lawful authority of said State, and under the direction, supervision, and control and governmental power of the State of Illinois, and which said State has heretofore at all times sanctioned and now, through its governor and other officers, sanctions the building of said channel and opening thereof.

And your orator further shows that in the construction of said channel or drain the defendant The Sanitary District of Chicago, Illinois, with the sanction and approval of the State of Illinois, cut through the natural ridge or water-shed which divides the basin of Lake Michigan from the basins of the Des Plaines and Illinois rivers and the basin of the Mississippi river, and that having so constructed said channel and having about completed the same, and having, under the supervision of and with the sanction of the State of Illinois, extended said artificial channel through said natural divide of the water-shed, the defendants now propose and threaten to receive into said channel or drain the sewage matter and filth of the Sanitary District of Chicago, which embraces nearly the whole city of 11 Chicago and a portion of the county of Cook, and, without any legal authority so to do, has already in part effectuated its said threat and purpose and threatens to permit and to cause said sewage and filth, by artificial means of pumping and otherwise, to flow through the channel or drain towards and into the said Des Plaines river and eventually into the Mississippi river, thereby, with the approval of and subject to the inspection and control and supervision of the State of Illinois, and by the pretended authority thereof, reversing the natural flow of said Chicago river.

And your orator further shows that the sewage matter and poisonous filth which it is thus threatened to receive and to permit and to cause to flow through said artificial channel into said Des Plaines river, is that which is created by a population of upwards of one and one-half millions of people, besides that which is created by a great number of stock yards, slaughtering establishments, rendering establishments, distilleries, and other business enterprises and industries lining both sides of the Chicago river, producing filth and noxious matters; all of which are there discharged into the said Chicago river or drained therein from the surface.

And your orator further shows that for many years past the said city of Chicago, the greater portion of which is embraced in the limits of the defendant corporation, The Sanitary District of Chicago, as aforesaid, has been discharging its sewage matter and filth into the Chicago river and into Lake Michigan in such large quantities that much of it has accumulated in the bed and along the sides of the river and upon the bed of said Lake Michigan, near the shores thereof, and that the plan threatened and attempted now to be adopted by the defendant The Sanitary District of Chicago, acting in conjunction with and subject to the control of the defendant The State of Illinois, and by the pretended authority of the said State of Illinois, will loosen said accumulated matter and filth, and 12 will also direct it and cause it to flow towards and into said artificial channel or drain, and thence into said Des Plaines river, and finally into the Mississippi river and into the waters thereof within the jurisdiction and under the control of your orator and past the homes of the inhabitants of your orator and the towns and cities within the borders of your orator, and past the water works of said cities and towns within the State of Missouri.

And your orator further shows that the amount of said undefecated filth and sewage and poisonous and unhealthful and noxious matters proposed to be, and now about to be, permitted to be turned into said artificial channel and through said Des Plaines and Illinois rivers into the Mississippi river from the said Sanitary District of Chicago by the defendants, acting jointly, will amount daily to about fifteen hundred tons, and that if defendants should be permitted to carry their said threats into execution, and should cause said above amount of undefecated sewage and other poisonous and noxious matters, which would otherwise flow into Lake Michigan, to flow into the Mississippi river, that the waters of the Mississippi river within the jurisdiction of your orator will of a certainty be poisoned and polluted and rendered wholly unfit and unhealthul for drinking and domestic uses, and will render wholly valueless and entirely worthless the various water-works systems of towns and cities on the borders of the State of Missouri, established and acquired at great cost and expense, and will deprive your orator, The State of Missouri, and its inhabitants, of the right to the use of the waters of said river for drinking and all other domestic and manufacturing and agricultural purposes, as said water has been so used in its accustomed and natural flow heretofore for the length of time that the memory of man runneth not to the contrary thereof.

13 And that said threatened action of the defendants will amount to a direct and continuing nuisance and be an interference with the use by your orator and its inhabitants of the waters of the Mississippi river flowing in their natural state, polluting and poisoning the same by the means aforesaid, whereby the health and lives of the inhabitants of your orator will be endangered and the business interests of said State will be greatly and irreparably injured, and which said damage to the lives and health and the business interests of said State resulting from said poisoning and polluting of said waters, as aforesaid, to your orator cannot be estimated in money value.

And your orator on information and belief states and charges the fact to be that said fifteen hundred tons of poisonous undefecated filth and sewage of said Sanitary District of Chicago will be daily carried through said artificial channel and sent through the Des Plaines and Illinois rivers into the Mississippi, and great quantities thereof will be deposited in the bed and soil of said river belonging to your orator and wholly within the jurisdiction thereof, to your orator's great and irreparable damage, and that the fifteen hundred tons of undefecated sewage and filth now about to be daily injected into the waters of the Mississippi river and into the portion thereof over which the State of Missouri has jurisdiction and from which thousands of her inhabitants obtain drinking water, will pollute and poison the said water of the Mississippi river to such an extent as to render it unwholesome and unfit and unhealthful for use for drinking by the said inhabitants in the territory of your orator and unfit for use for watering stock and for manufacturing purposes.

And your orator further shows that great quantities of undefecated sewage turned into the Mississippi river in the manner and by the means aforesaid will poison and pollute said water with the germs of disease of various and many kinds. And your orator further shows that the acts herein complained of on the part of the

State of Illinois, acting in conjunction with one of her governmental
agencies, the said Sanitary District of Chicago, will cause a
14 continuing nuisance in the Mississippi river, and that the
said State of Illinois has no power or authority to cause or
permit or assist in causing the commission and continuance of a
nuisance in the flowing waters of the Mississippi river, a navigable
stream, to the detriment and irreparable and continuing damage
and injury of the State of Missouri, and the continuing and irreparable
injury to the lives and health of the citizens and inhabitants
of the State of Missouri, and that unless restrained by the order and
decree of this court the defendants, The State of Illinois and The
Sanitary District of Chicago, acting together, will, in accordance
with the terms of the act under which said Sanitary District is organized,
upon the permit and authority of the governor of Illinois
and of the State of Illinois, turn said water and sewage aforesaid, by
the manner and means aforesaid, into the Des Plaines and Illinois
rivers and thence into the Mississippi, all of which your orator says
and avers is contrary to equity and good conscience, and would result
in the manifest and irreparable injury of your orator and the
health of her citizens in the premises, and your orator is wholly
without remedy at law and without any adequate remedy to prevent
the flowing of said sewage, as aforesaid, save by the interposition of
this court.

Forasmuch as your orator can have no adequate relief except in
this court, and to the end, therefore, that the defendants may, if
they can, show why your orator should not have the relief prayed,
and to the end that the defendants may make a full, true, direct,
and perfect answer to the matters hereinbefore stated and charged,
but not under oath, an answer under oath being hereby expressly
waived, and to the end that the defendants, their officers, agents,
servants, and employés, may be restrained by injunction issuing out
of this court from receiving or permitting any sewage to be received
or discharged into said artificial channel or drain, and from permitting
the same to flow or causing the same to be made to
15 flow through said channel or drain towards and into the Des
Plaines river, your orator prays that your honors may grant
a writ of injunction, under the seal of this honorable court, properly
restraining and enjoining the defendants, the officers, agents, employés,
and servants of the Sanitary District of Chicago and the
State of Illinois, from permitting or causing any of said sewage to be
discharged into said channel or drain, and from permitting or causing
said sewage and poisonous filth thence to flow into said Des
Plaines river; that defendant The State of Illinois be enjoined and
restrained from issuing to its codefendant permission and authority
to do and perform the acts aforesaid or to allow them to be done;
and your orator also prays for a provisional or temporary injunction
pending this cause, restraining and enjoining the several acts aforesaid,
and for such other and further relief as the equity of the case
may require and to your honors may seem meet.

May it please your honors to grant unto your orator not only a writ of injunction conformable to the prayer of this bill, but also a writ of subpœna of the United States of America, directed to The State of Illinois, the governor and attorney general thereof, and to said Sanitary District of Chicago, its officers, trustees, and agents, commanding them on a day certain to appear and answer unto this bill of complaint, and to abide such order and decree of the court in the premises as to the court shall seem proper and required by the principles of equity and good conscience.

THE STATE OF MISSOURI,
By LON V. STEPHENS, Governor.

EDWARD C. CROW,
Attorney General of Missouri.
B. SCHNURMACHER, Of Counsel.

16 UNITED STATES OF AMERICA:

In the Supreme Court of the United States.

On this 17th day of January, 1900, before me, James D. Maher, notary public, personally appeared Lon V. Stephens, governor of The State of Missouri, the complainant above named, who, being by me duly sworn, deposes and says that he is the governor of Missouri and familiar with its affairs and business; that he has read the foregoing bill of complaint and knows the contents thereof, and that the same is true of his own knowledge, except as to the matters therein stated on information and belief, and as to those matters he verily believes it to be true.

LON V. STEPHENS.

Subscribed and sworn to before me this 17th day of January, A. D. 1900.

[SEAL.]

JAMES D. MAHER,
Notary Public, District of Columbia.

(Endorsed:) In the Supreme Court of the United States. The State of Missouri, complainant, *vs.* The State of Illinois and The Sanitary District of Chicago, defendants. In equity. Bill of injunction.

(Endorsed:) Supreme Court U. S., October term, 1899. No. 7, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Bill of complaint. Filed January 22, 1900.

17 And on the same day, to wit, on the 22d day of January, A. D. 1900, an order for appearance for complainant was filed in the words and figures following, viz:

Order for Appearance.

Supreme Court of the United States, October Term, 1899.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 7, Orig'l.

The clerk will enter our appearance as counsel for the complainant.

EDWARD C. CROW,
Jefferson City, Mo.
(Name.) B. SCHNURMACHER,
(P. O. Address.) St. Louis, Mo.

☞ NOTE.—Must be signed by a member of the bar of the Supreme Court United States. Individual and not firm names must be signed.

(Endorsed :) Supreme Court U. S. October term 1899. Term No. 7, original. Appearance for complainant. Filed Jan'y 22, 1900.

18 And afterwards, to wit, on the 23d day of January, A. D. 1900, a subpœna was issued and delivered to the marshal for service.

And afterwards, to wit, on the 29th day of January, A. D. 1900, the subpœna, and proof of service of same, was filed in the words and figures following, viz :

19 THE UNITED STATES OF AMERICA, ss :

[SEAL.] The President of the United States of America to the State of Illinois and the Sanitary District of Chicago, Greeting :

For certain causes offered before the Supreme Court of the United States having jurisdiction in equity, you are hereby commanded that laying all other matters aside and notwithstanding any excuse, you be and appear before the said Supreme Court holding jurisdiction in equity, on the first Monday of April next at the city of Washington, in the District of Columbia, being the seat of the National Government of the United States, to answer unto the bill of complaint of the State of Missouri in the said court exhibited against you. Hereof you are not to fail at your peril.

Witness the Honorable Melville W. Fuller, Chief Justice of the United States, at the city of Washington, the 23d day of January, A. D. 1900.

JAMES H. McKENNEY,
Clerk of the Supreme Court of the United States.

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS & THE SANITARY DISTRICT of Chicago.
} No. 7, Orig'l.

The clerk will enter my appearance as counsel for the defendants.
(Name.) WM. M. SPRINGER,
(P. O. address.) Kellogg Building, Washington, D. C.

☞ NOTE.—Must be signed by a member of the bar of the Supreme Court United States. Individual and not firm names must be signed.

(Endorsed:) Supreme Court U. S., October term, 1899. Term No. 7, orig'l. Appearance for def'ts. Filed Mar. 5, 1900.

23 And afterwards, to wit, on the 9th day of April, A. D. 1900, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 7, Original.

On motion of Mr. William M. Springer, of counsel for defendants, leave is hereby granted to file a demurrer herein, and leave is granted counsel for the complainant to file a printed brief thereon within twenty days.

24 And on the same day, to wit, on the 9th day of April, A. D. 1900, a demurrer was filed in the words and figures following, viz:

25 In the Supreme Court of the United States, October Term, 1899.

THE STATE OF MISSOURI, Complainant, *v.* THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.	Number 7, Original.

Demurrer of Defendants to Bill of Complaint.

Now comes the State of Illinois by its attorney general, Edward C. Akin, and the Sanitary District of Chicago, by its attorneys, and demur to the bill of complaint filed herein, and say, that the said bill of complaint and the matters therein contained, in manner and form as the same are above stated and set forth, are not sufficient in law for the said State of Missouri to have and maintain its aforesaid action against the said State of Illinois and the Sanitary District of Chicago, and that said defendants are not bound by the law of the land to answer the same; and the said defendants, according to the form of the statute in such case made and provided, state and 26 show to the court here the following causes of demurrer to the said bill of complaint:

First. That this court has no jurisdiction of either the parties to, or of the subject matter of, this suit, because it appears upon the face of said bill of complaint that the matters complained of, as set forth therein, do not constitute, within the meaning of the Constitution of the United States, any controversy between the State of Missouri and the State of Illinois, or any of its citizens.

Second. That the matters alleged and set forth in said *said* bill of complaint show that the only issues presented therein arise, if at all, between the State of Illinois and a public corporation created under the laws of said State, and certain cities and towns, in their corporate capacity as such, in the State of Missouri, and certain persons in said State of Missouri, residing on or near the banks of the Mississippi river, and which matters so stated in said bill of complaint, if true, do not concern the State of Missouri as a corporate body or State.

Third. That said biil of complaint shows upon its face that this suit is in fact for and on behalf of certain cities and towns in said State of Missouri, situate on the banks of the Mississippi river, and certain persons who reside in said State on or near the banks of said river; and that, although the said suit is attempted to be prosecuted for and in the name of the State of Missouri, said State is, in effect, loaning its name to said cities and towns and to said individuals, and is only a nominal party to said suit, and that the real parties in interest are the said cities and towns in their corporate capacity as such, and said private persons or citizens of said State.

Fourth. That it appears upon the face of said bill of complaint,
that the said State of Missouri, in her right of sovereignty, is
27 seeking to maintain this suit for the redress of the supposed
wrongs of certain cities and towns in said State, in their corporate capacity as such, and of certain private citizens of said State, while under the Constitution of the United States and the laws enacted thereunder, the said State possesses no such sovereignty as empowers it to bring an original suit in this court for such purpose.

Fifth. That it appears upon the face of said bill of complaint, that no property rights of the State of Missouri are in any manner affected by the matters alleged in said bill of complaint; nor is there any such property right involved in this suit as would give this court original jurisdiction of this cause.

Sixth. That in order to authorize this court to maintain original jurisdiction of this suit as against the State of Illinois, or against any citizens of said State, it must appear that the controversy set forth in the bill of complaint and to be determined by this court, is a controversy arising directly between the State of Missouri and the State of Illinois, or some of its citizens, and not a controversy in vindication of the alleged grievances of certain cities and towns in said State or of particular individuals residing therein.

Seventh. That said bill of complaint is in other respects uncertain informal and insufficient, and that it does not state facts sufficient to entitle the said State of Missouri to the equitable relief prayed for in said bill of complaint.

Wherefore, for want of a sufficient bill of complaint in this behalf, the said defendants pray judgment; and that the said State of Missouri may be barred from having or maintaining the aforesaid action
against said defendants, and that this court will not take fur-
28 ther cognizance of this cause, and that the said defendants be
hence dismissed with their costs.

THE STATE OF ILLINOIS,
By EDWARD C. AKIN,
Attorney General of the State of Illinois.
CHARLES C. GILBERT,
SAMUEL M. BURDETT,
Attorneys of the Sanitary District of Chicago.
WILLIAM M. SPRINGER,
Of Counsel for Defendants.

I, William M. Springer, of counsel for the said defendants, do certify that the above demurrer is, in my opinion, well founded in point of law.

WILLIAM M. SPRINGER,
Of Counsel for Defendants.

I, William M. Springer, of counsel for said defendants, upon my oath do say, that the above demurrer is not interposed for delay.

WILLIAM M. SPRINGER,
Of Counsel for Defendants.

Subscribed and sworn to before me this 17th day of March, 1900.

[L. S.]

EDW'D N. LEWIS,
Notary Public.

(Endorsed:) Supreme Court U. S., October term 1899 No. 7, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Demurrer of defendants to bill of complaint. Filed April 9, 1900.

29 And afterwards, to wit, on the 30th day of April, A. D. 1900, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 7, Original.

This cause was submitted to the consideration of the court on the demurrer of the defendants on printed arguments by Mr. E. C. Crow and Mr. B. Schnurmacher, of counsel for the complainant, and Mr. W. M. Springer and Mr. E. C. Akin, of counsel for the defendants, with leave to counsel for defendants to file brief within one week.

30 And afterwards, to wit, on the 21st day of May, A. D. 1900, the following order appears of record, viz:

Supreme Court of the United States, October Term, 1899.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 7, Original.

It is ordered by the court that this cause be, and the same is hereby, restored to the docket for oral argument May 21, 1900.

(Endorsed:) Supreme Court U. S., October term, 1899. No. 7, original. Order. Filed May 21, 1900.

31 And afterwards, to wit, on the 9th day of October, A. D. 1900, a motion to assign demurrer for argument was filed and submitted in the words and figures following, viz:

32 Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS and THE SANITARY DISTRICT of Chicago. } No. 5, Original.

Come now the said defendants and move this honorable court to set down the demurrer in this case for oral argument on Monday, November 12, 1900, or as soon thereafter as it may please the court to hear the same; and that there be allowed two hours for argument to counsel on each side of the case.

Counsel for said defendants respectfully submit that this motion as to the time for oral argument meets the approval of counsel for plaintiff.

Respectfully submitted,

WM. M. SPRINGER,
Counsel for Defendants.

33 Coat of Arms
of
State of Missouri.

State of Missouri, City of Jefferson, Legal Department.

Edward C. Crow, Attorney General; Sam. B. Jeffries, Assistant.

OCTOBER 3, 1900.

Hon. Wm. M. Springer, Kellogg building, 1416 F street, Washington, D. C.

DEAR SIR: I have communicated with Hon. Benj. Schnurmacher, counsellor for St. Louis city, and he states that your suggestion about the argument of the demurrer in Missouri *vs.* Illinois being postponed until Nov. 12th, will be agreeable to him, and I write to say that it will suit me exactly; I shall act upon the theory that the matter will be heard on November 12th.

Very truly yours, EDWARD C. CROW,
Attorney General.

Endorsed: Supreme Court U. S, October term, 1900. No. 4, original. The State of Missouri, complainant, *v.* The State of Illinois *et al.* Motion to assign demurrer for argument. Office Supreme Court U. S. Filed Oct. 9, 1900. James H. McKenney, clerk.

34 And on the same day, to wit, on the 9th day of October, A. D. 1900, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 5, Original.

On motion of Mr. William M. Springer, of counsel for the defendants, it is ordered by the court that this cause be, and the same is hereby, assigned for argument on Monday, November 12th.

35 And afterwards, to wit, on the 12th day of November, A. D. 1900, an order for appearance for respondents was filed in the words and figures following, viz:

Order for Appearance.

Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
No. 5, Orig'l.

The clerk will enter my appearance as counsel for the respondents.

(Name.) CHARLES C. GILBERT,
(P. O. address.) 1106 Security Bldg., Chicago, Ills.

☞ NOTE.—Must be signed by a member of the bar of the Supreme Court United States. Individual and not firm names must be signed.

(Endorsed:) Supreme Court U. S., October term, 1900. Term No. 5, orig'l. Appearance for respondents. Filed Nov. 12, 1900.

36 And on the same day, to wit, on the 12th day of November, A. D. 1900, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 5, Original.

The argument of the demurrer in this cause was commenced by Mr. Charles C. Gilbert, of counsel for the defendants, and continued by Mr. B. Schnurmacher of counsel for the complainant.

And afterwards, to wit, on the 13th day of November, A. D. 1900, the following entry appears of record, viz:

37 THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 5, Original.

The argument of the demurrer in this cause was continued by Mr. B. Schnurmacher, of counsel for the complainant, and concluded by Mr. William M. Springer, of counsel for the defendants.

38 And afterwards, to wit, on the 28th day of January, A. D. 1901, the following order appears of record, viz:

Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
No. 5, Original.

This cause came on to be heard on the bill of complaint and demurrer of the defendants thereto, and was argued by counsel. On consideration whereof, it is now here ordered, adjudged, and decreed by this court that said demurrer be, and the same is,
39 hereby, overruled, and leave is given to the defendants to file answers to the bill.
January 28, 1901.

(Endorsed:) Supreme Court U. S., October term, 1900. No. 5, original. Order. Filed January 28, 1901.

And on the same day, to wit, on the 28th day of January, A. D. 1901, an opinion and dissenting opinion were filed in the words and figures following, to wit:

40 Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
No. 5, Original.

(January 28, 1901.)

In January, 1900, the State of Missouri filed in this court a bill of complaint against the State of Illinois and the Sanitary District of Chicago, a corporation of the latter State, in the following terms:

"The complainant, The State of Missouri, and one of the States of the United States, brings this its bill of complaint against the State of Illinois, one of the States of the United States, and the Sanitary District of Chicago, a public corporation, organized under the laws of the State of Illinois, and located in part in the city of Chicago and in the county of Cook, in said State of Illinois, and a citizen of the State of Illinois.

"And your orator *complains and says that it is a State containing* a population of upwards of three millions of people, and lying on the west bank of the Missouri river, a public, navigable and running stream, and having a frontage on said stream of over four hundred miles.

"And your orator shows that by the act of Congress providing for the organization and admission of Illinois and Missouri as States of the Union it was declared that the western boundary of Illinois and the eastern boundary of Missouri should be the middle of the main channel of the Mississippi river; that the shores of the Mississippi river, where its waters form the Missouri and Illinois boundary, and the soil under the water thereof, were not granted by the Constitution of the United States, but were reserved to the States of Illinois and Missouri respectively.

"And your orator shows that the States of Missouri and Illinois each have concurrent general jurisdiction over the waters of the Mississippi river forming the boundary between them, and each of said States has exclusive territorial jurisdiction over that portion adjacent to its own shore, and your orator shows that the Illinois river empties into the Mississippi river at a point above the city of St. Louis, on the Illinois side of said Mississippi river.

"And your orator further shows that within the territory of your orator and on the banks and shores of said Mississippi river and below the mouth of the Illinois river are many cities and towns in the State of Missouri, and many thousands of persons who are compelled to and do rely upon the waters of said river, in their regular, natural and accustomed flow, for their daily necessary supply of water for drinking and all other domestic and agricultural and manufacturing purposes, and for watering stock and animals of all kinds, and that said Mississippi river has been flowing in its regular
41 course and has been used for the purposes aforesaid by
the inhabitants of the said State of Missouri for a time whereof the memory of a man runneth not to the contrary, and that said river and its waters and the use thereof for drinking, agricultural and manufacturing purposes, in their accustomed and natural flow, are indispensable to the life and health and business of many thousands of the inhabitants of the State of Missouri and of great value to your orator as a State.

"And your orator shows that cities and towns below the mouth of said Illinois river, within the territory of your orator, do and are compelled, by means of water works, water towers and intakes, built and constructed for that purpose, to supply the inhabitants of said cities and towns with an adequate supply of pure and wholesome water, fit and healthful for drinking and all other domestic purposes and uses, from the said Mississippi river so flowing in its ancient, accustomed and natural course.

"And your orator shows that said water works systems are constructed with reference to said Mississippi river and for the purpose of taking water therefrom and not from any other source.

"And your orator shows that heretofore, to wit, in 1889, the State of Illinois enacted a law known as the Sanitary District act, together with an act for the improvement of the Illinois and Des Plaines rivers, and that under said act of said State the said corporation known as the said Sanitary District of Chicago was organized and is now existing and operating, and that by the express terms of said act any canal or drain corporation organized in accordance with its provisions may have conditions, restrictions or additional requirements placed on said corporation, or the act authorizing the creation of said corporation may be amended or repealed, and that by the express provisions of said act, before any water or sewage shall be admitted into any channel constructed under said act, the trustees of said channel shall notify the governor of Illinois of the completion of said channel, and the governor of Illinois shall appoint three commissioners to examine said canal or channel and report to the governor if the same complies with the act of the State of Illinois; and if it does, the governor shall authorize the water and sewage to be turned into said channel; and that without the said permit it cannot be so turned in; and that by the general provisions of said act said channel is at all times subject to the control and supervision of the State of Illinois and her authorities.

"And your orator further shows that the Chicago river is situated in the basin of Lake Michigan and has two forks or branches flowing through the city of Chicago and into Lake Michigan, and that the natural drainage of Chicago, Illinois, is into Lake Michigan, and the sewage and drainage of the territory embraced in the defendant's district, the Sanitary District of Chicago, is led into or flows into the Chicago river and Lake Michigan.

"And your orator further shows that the defendant herein, The Sanitary District of Chicago, with the authority of the State of Illinois, and acting as a governmental agency of said State, and under the supervision and control and subject to the approval of the State of Illinois, has constructed a channel or open drain from the West fork of the South branch of the Chicago river, in the city of Chicago and county af Cook, in the State of Illinois, to a point near Lockport, in the county of Will, in said State, where said channel or drain connects with and empties into the Des Plaines river, which empties into the Illinois river, and which latter river flows and empties into the Mississippi river at a point distant about forty-three miles above the city of St. Louis, Missouri. 42

"And your orator further states that the channel built by the Sanitary District of Chicago was so built by said Sanitary District as one of the governmental agencies of the State of Illinois, and by the pretended lawful authority of said State, and under the direction, supervision and control and governmental power of the State of Illinois, and which said State has heretofore at all times sanctioned and now, through its governor and other officers, sanctions the building of said channel and opening thereof.

"And your orator further shows that in the construction of said channel or drain the defendant, The Sanitary District of Chicago, Illinois, with the sanction and approval of the State of Illinois, cut through the natural ridge or watershed which divides the basin of Lake Michigan from the basins of the Des Plaines and Illinois rivers and the basin of the Mississippi river, and that having so constructed said channel and having about completed the same, and having, under the supervision of and with the sanction of the State of Illinois, extended said artificial channel through said natural divide of the watershed, the defendants now propose and threaten to receive into said channel or drain the sewage matter and filth of the Sanitary District of Chicago, which embraces nearly the whole city of Chicago and a portion of the county of Cook, and, without any legal authority so to do, has already in part effectuated its said threat and purpose and threatens to permit and to cause said sewage and filth, by artificial means of pumping and otherwise, to flow through the channel or drain towards and into the said Des Plaines river and eventually into the Mississippi river, thereby, with the approval of and subject to the inspection and control and supervision of the State of Illinois, and by the pretended authority thereof, reversing the natural flow of said Chicago river.

"And your orator further shows ,that the sewage matter and poisonous filth which it is thus threatened to receive and to permit and to cause to flow through said artificial channel into said Des Plaines river is that which is created by a population of upwards of one and one-half millions of people, besides that which is created by a great number of stock yards, slaughtering establishments, rendering establishments, distilleries and other business enterprises and industries lining both sides of the Chicago river, producing filth and noxious matters; all of which are there discharged into the said Chicago river or drained therein from the surface.

"And your orator further shows that for many years past the said city of Chicago, the greater portion of which is embraced in the limits of the defendant corporation, The Sanitary District of Chicago, as aforesaid, has been discharging its sewage matter and filth into the Chicago river and into Lake Michigan in such large quantities that much of it has accumulated in the bed and along the sides of the river and upon the bed of said Lake Michigan, near the shores thereof, and that the plan threatened and attempted now to be adopted by the defendant, The Sanitary District of Chicago, acting in conjunction with and subject to the control of the defendant, The State of Illinois, and by the pretended authority of the said State of Illinois, will loosen said accumulated matter and filth, and will also direct it and cause it to flow towards and into said artificial channel or drain, and thence into said Des Plaines river, and finally into the Mississippi river and into the waters thereof within the jurisdiction and under the control of your orator and past the homes of 43 the inhabitants of your orator and the towns and cities within the borders of your orator, and past the water works of said cities and towns within the State of Missouri.

"And your orator further shows that the amount of said undefecated filth and sewage and poisonous and unhealthful and noxious matters proposed to be, and now about to be, permitted to be turned into said artificial channel and through said Des Plaines and Illinois rivers into the Mississippi river from the said Sanitary District of Chicago by the defendants, acting jointly, will amount daily to about fifteen hundred tons, and that if defendants should be permitted to carry their said threats into execution, and should cause said above amount of undefecated sewage and other poisonous and noxious matters, which would otherwise flow into Lake Michigan, to flow into the Mississippi river, that the waters of the Mississippi river within the jurisdiction of your orator will of a certainty be poisoned and polluted and rendered wholly unfit and unhealthful for drinking and domestic uses, and will render wholly valueless and entirely worthless the various water works systems of towns and cities on the borders of the State of Missouri, established and acquired at great cost and expense, and will deprive your orator, The State of Missouri, and its inhabitants, of the right to use of the waters of said river for drinking and all other domestic and manufacturing and agricultural purposes, as said water has been so used in its accustomed and natural flow heretofore for the length of time that the memory of man runneth not to the contrary thereof.

"And that said threatened action of the defendants will amount to a direct and continuing nuisance and be an interference with the use by your orator and its inhabitants of the water of the Mississippi river flowing in their natural state, polluting and poisoning the same by the means aforesaid, whereby the health and lives of the inhabitants of your orator will be endangered and the business interests of said State will be greatly and irreparably injured, and which said damage to the lives and health and the business interests of said State resulting from said poisoning and polluting of said waters as aforesaid to your orator cannot be estimated in money value.

"And your orator on information and belief states and charges the fact to be that said fifteen hundred tons of poisonous undefecated filth and sewage of said Sanitary District of Chicago will be daily carried through said artificial channel and sent through the Des Plaines and Illinois rivers into the Mississippi, and great quantities thereof will be deposited in the bed and soil of said river belonging to your orator and wholly within the jurisdiction thereof, to your orator's great and irreparable damage, and that the fifteen hundred tons of undefecated sewage and filth now about to be daily injected into the waters of the Mississippi river and into the portion thereof over which the State of Missouri has jurisdiction, and from which thousands of her inhabitants obtain drinking water, will pollute and poison the said water of the Mississippi river to such an extent as to render it unwholesome and unfit and unhealthful for use for drinking by the said inhabitants in the territory of your orator and unfit for use for watering stock and for manufacturing purposes.

"And your orator further shows that great quantities of undefecated sewage turned into the Mississippi river in the manner and by the means aforesaid will poison and pollute said water with the germs of disease of various and many kinds. And your orator further shows that the acts herein complained of on the part 44 of the State of Illinois, acting in conjunction with one of her governmental agencies, the said Sanitary District of Chicago, will cause a continuing nuisance in the Mississippi river, and that the said State of Illinois has no power or authority to cause or permit or assist in causing the commission and continuance of a nuisance in the flowing waters of the Mississippi river, a navigable stream, to the detriment and irreparable and continuing damage and injury of the State of Missouri, and the continuing and irreparable injury to the lives and health of the citizens and inhabitants of the State of Missouri, and that unless restrained by the order and decree of this court the defendants, The State of Illinois and The Sanitary District of Chicago, acting together, will, in accordance with the terms of the act under which said Sanitary District is organized, upon the permit and authority of the governor of Illinois and of the State of Illinois, turn said water and sewage aforesaid, by the manner and means aforesaid, into the Des Plaines and Illinois rivers and thence into the Mississippi, all of which your orator says and avers is contrary to equity and good conscience, and would result in the manifest and irreparable injury of your orator and the health of her citizens in the premises, and your orator is wholly without remedy at law and without any adequate remedy to prevent the flowing of said sewage, as aforesaid, save by the interposition of this court.

"For as much as your orator can have no adequate relief except in this court, and to the end, therefore, that the defendants may, if they can, show why your orator should not have the relief prayed, and to the end that the defendants may make a full, true, direct and perfect answer to the matters hereinbefore stated and charged, but not under oath, an answer under oath being hereby expressly waived, and to the end that the defendants, their officers, agents, servants and employees may be restrained by injunction issuing out of this court from receiving or permitting any sewage to be received or discharged into said artificial channel or drain, and from permitting the same to flow or causing the same to be made to flow through said channel or drain towards and into the Des Plaines river, your orator prays that your honors may grant a writ of injunction, under the seal of this honorable court, properly restraining and enjoining the defendants, the officers, agents, employees and servants of the Sanitary District of Chicago and the State of Illinois, from permitting or causing any of said sewage to be discharged into said channel or drain, and from permitting or causing said sewage and poisonous filth thence to flow into said Des Plaines river; that defendant, The State of Illinois, be enjoined and restrained from issuing to its codefendant permission and authority to do and perform the acts aforesaid or to allow them to be done; and your orator also prays for a provisional or temporary injunction pending this cause, restraining and enjoining the several acts aforesaid, and for such other and further relief as the equity of the case may require and to your honors may seem meet.

"May it please your honors to grant unto your orator not only a writ of injunction conformable to the prayer of this bill, but also a writ of subpœna of the United States of America, directed to the State of Illinois, the governor and attorney general thereof, and to said Sanitary District of Chicago, its officers, trustees and agents, commanding them on a day certain to appear and answer unto this bill of complaint, and to abide such order and decree of the court in the premises as to the court shall seem proper and required by the principles of equity and good conscience."

45 In March, 1900, came the defendants and filed a demurrer to the bill of complaint, in the following terms:

"Now comes the State of Illinois by its attorney general, Edwin C. Akin, and the Sanitary District of Chicago, by its attorneys, and demur to the bill of complaint filed herein, and say that the said bill of complaint and the matters therein contained, in manner and form as the same are above stated and set forth, are not sufficient in law for the said State of Missouri to have and maintain its aforesaid action against the said State of Illinois and the Sanitary District of Chicago, and that said defendants are not bound by the law of the land to answer the same; and the said defendants, according to the form of the statute in such case made and provided, state and show to the court here the following causes of demurrer to the said bill of complaint:

"*First.* That this court has no jurisdiction of either the parties to, or of the subject matter of, this suit, because it appears upon the face of said bill of complaint that the matters complained of, as set forth therein, do not constitute, within the meaning of the Constitution of the United States, any controversy between the State of Missouri and the State of Illinois, or any of its citizens.

"*Second.* That the matters alleged and set forth in said bill of complaint show that the only issues presented therein arise, if at all, between the State of Illinois and a public corporation created under the laws of said State, and certain cities and towns, in their corporate capacity as such, in the State of Missouri, and certain persons in said State of Missouri, residing on or near the banks of the Mississippi river, and which matters so stated in said bill of complaint, if true, do not concern the State of Missouri as a corporate body or State.

"*Third.* That said bill of complaint shows upon its face that this suit is in fact for and on behalf of certain cities and towns in said State of Missouri, situate on the banks of the Mississippi river, and certain persons who reside in said State on or near the banks of said river; and that, although the said suit is attempted to be prosecuted for and in the name of the State of Missouri, said State is, in effect loaning its name to said cities and towns and to said individuals, and is only a nominal party to said suit, and that the real parties in interest are the said cities and towns in their corporate capacity as such, and said private persons or citizens of said State.

"*Fourth.* That it appears upon the face of said bill of complaint that the said State of Missouri, in her right of sovereignty, is seeking to maintain this suit for the redress of the supposed wrongs of certain cities and towns in said State, in their corporate capacity as such, and of certain private citizens of said State, while under the Constitution of the United States and the laws enacted thereunder, the said State possesses no such sovereignty as empowers it to bring an original suit in this court for such purpose.

"*Fifth.* That it appears upon the face of said bill of complaint that no property rights of the State of Missouri are in any manner affected by the matters alleged in said bill of complaint; nor is there any such property right involved in this suit as would give this court original jurisdiction of this cause.

46 "*Sixth.* That in order to authorize this court to maintain original jurisdiction of this suit as against the State of Illinois, or against any citizens of said State, it must appear that the controversy set forth in the bill of complaint and to be determined by this court, is a controversy arising directly between the State of Missouri and the State of Illinois, or some of its citizens, and not a controversy in vindication of the alleged grievances of certain cities and towns in said State or of particular individuals residing therein.

"*Seventh.* That said bill of complaint is in other respects uncertain, informal and insufficient, and that it does not state facts sufficient to entitle the said State of Missouri to the equitable relief prayed for in said bill of complaint.

"Wherefore, for want of a sufficient bill of complaint in this behalf, the said defendants pray judgment; and that the said State of Missouri may be barred from having or maintaining the aforesaid action against said defendants, and that this court will not take further cognizance of this cause, and that the said defendants be hence dismissed with their costs."

On November 12, 1900, the case came on to be heard on bill and demurrer, and was argued by counsel.

Mr. Justice SHIRAS delivered the opinion of the court.

This cause is now before us on the bill of complaint and the demurrer thereto.

The questions thus presented are two: First, whether the allegations of the bill disclose the case of a controversy between the State of Missouri and the State of Illinois and a citizen thereof, within the meaning of the Constitution and statutes of the United States, which create and define the original jurisdiction of this court; and, second, whether, if it be held that the allegations of the bill do present such a controversy, they are sufficient to entitle the State of Missouri to the equitable relief prayed for.

The question whether the acts of one State in seeking to promote the health and prosperity of its inhabitants by a system of public works, which endangers the health and prosperity of the inhabitants of another and adjacent State, would create a sufficient basis for a controversy, in the sense of the Constitution, would be readily answered in the affirmative if regard were to be had only to the language of that instrument.

"The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. * * * The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority, * * * to controversies between two or more States, between a State and citizens of another State. * * * In all cases, * * * in which a State shall be a party, the Supreme Court shall have original jurisdiction." (Constitution, article 3.)

47 As there is no definition or description contained in the Constitution of the kind and nature of the controversies that should or might arise under these provisions, it might be supposed that, in all cases wherein one State should institute legal proceedings against another, the original jurisdiction of this court would attach.

But in this, as in other instances, when called upon to construe and apply a provision of the Constitution of the United States, we must look not merely to its language, but to its historical origin, and to those decisions of this court in which its meaning and the scope of its operation have received deliberate consideration.

After the declaration of independence the united colonies, through delegates appointed by each of the colonies, considered articles of confederation, which were debated from day to day, and from time to time, for two years, and were on July 9, 1778, ratified by ten States; by New Jersey, on November 26 of the same year; by Delaware, on the 23d of February, 1779, and by Maryland on March 1, 1781.

The first article was as follows: "The style of this confederacy shall be, 'The United States of America.'"

The ninth article contained, among other provisions, the following: "The United States in Congress assembled shall also be the last resort on appeal in all disputes and differences now subsisting, or that may hereafter arise, between two or more States, concerning boundary, jurisdiction or any other cause whatsoever; which authority shall always be exercised in the manner following: Whenever the legislative or executive authority, or lawful agent, of any State, in controversy with another, shall present a petition to Congress,

stating the matter in question, and praying for a hearing, notice thereof shall be given by order of Congress to the legislative or executive authority of the other State in controversy, and a day assigned for the appearance of the parties, by their lawful agents, who shall then be directed to appoint, by joint consent, commissioners or judges to constitute a court for hearing and determining the matter in question; but if they cannot agree, Congress shall name three persons out of each of the United States, and from the list of such persons each party shall alternately strike out one, the petitioners beginning, until the number shall be reduced to thirteen; and from that number not less than seven nor more than nine names, as Congress shall direct, shall, in the presence of Congress, be drawn out by lot; and the persons whose names shall be so drawn, or any five of them, shall be commissioners or judges, to hear and finally determine the controversy, so always as a major part of the judges, who shall hear the cause, shall agree in the determination; and if either party shall neglect to attend at the day appointed, without showing reasons which Congress shall judge sufficient, or being present shall refuse to strike, the Congress shall proceed to nominate three persons out of each State, and the secretary of Congress shall strike in behalf of said party absent or refusing; and the judgment or sentence of the court, to be appointed in the manner before prescribed, shall be final and conclusive; and if any of the parties shall refuse to submit to the authority of such court, or to appear or defend their claim or
cause, the court shall nevertheless proceed to pronounce judg-
48 ment or sentence, which shall in like manner be final and
decisive—the judgment or sentence, and other proceedings, being in either case transmitted to Congress, and lodged among the acts of Congress for the security of the parties concerned; provided, that every commissioner, before he sits in judgment, shall take an oath, to be administered by one of the judges of the supreme or superior court of the State where the cause shall be tried, well and truly to hear and determine the matter in question, according to the best of his judgment, without favor, affection or hope of reward; provided, also, that no State shall be deprived of territory for the benefit of the United States."

It will therefore be perceived that under the confederation the necessity of a tribunal to hear and determine matters in question between two or more States was recognized; that a court was provided for that purpose; and that the scope or field within which it was expected such matters in question or controversies should or might arise for the determination of such court, extended to "*all disputes and differences now subsisting or that may hereafter arise between two or more States concerning boundary, jurisdiction or any cause whatever.*"

When the Federal convention met in 1787 to form the present Constitution of the United States several drafts of such an instrument were presented for the consideration of the convention. One of these was offered on May 29 by Edmund Randolph, of Virginia, in the shape of resolutions covering the entire subject of a national government. The ninth resolution prescribed the formation of a national judiciary, to consist of a supreme and inferior tribunals, with jurisdiction to hear and determine, among other things, "questions which involve the internal peace or harmony." (Elliot's Deb. vol. 1, p. 143.) On the same day Charles Pinckney, of South Carolina, submitted a draft of a Federal Government, the seventh article whereof was as follows:

"The Senate shall have the sole and exclusive power to declare war and to make treaties, and to appoint ambassadors and other ministers to foreign nations, and judges of the Supreme Court."

"They shall have the exclusive power to regulate the manner of deciding all disputes and controversies now subsisting, or which may arise, between the States respecting jurisdiction or territory." (Elliot's Deb. vol. 1, p. 145.)

On June 19 the committee of the whole, to which had been referred the several propositions and drafts, reported to the convention for its consideration a draft as altered, amended and agreed to in the committee. The thirteenth resolution was as follows:

"That the jurisdiction of the national judiciary shall extend to cases which respect the collection of the national revenue, impeachment of any national officers, and questions which involve the national peace and harmony." (Elliot's Deb. vol. 1, p. 182.)

49 On August 6 a committee of five members, to which the various propositions, as originally made and as amended in the committee of the whole, reported to the convention a draft of the Constitution, the ninth article of which was as follows:

"SEC. 1. The Senate of the United States shall have power to make treaties and appoint ambassadors and judges of the Supreme Court.

"SEC. 2. In all disputes and controversies now subsisting, or that may hereafter subsist, between two or more States, respecting jurisdiction or territory, the Senate shall possess the following powers, &c. [And here follows a scheme for a special court, in terms similar to that provided in the articles of confederation.]

"SEC. 3. All controversies concerning lands claimed under different grants of two or more States, whose jurisdiction, as they respect such lands, shall have been decided, or adjusted subsequent to such grants, or any of them, shall, on application to the Senate, be finally determined, as near as may be, in the same manner as is before prescribed for deciding controversies between different States."

The eleventh article contained, among other sections, the following:

"SEC. 1. The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as shall, when necessary, from time to time, be constituted by the legislature of the United States. * * *

"SEC. 3. The jurisdiction of the Supreme Court shall extend to all cases arising under laws passed by the legislature of the United

States; to all cases affecting ambassadors, other public ministers and consuls; to the trial of impeachment of officers of the United States; to all cases of admiralty and maritime jurisdiction; to controversies between two or more States, except such as shall regard territory or jurisdiction; between a State and citizens of another State; between citizens of different States; and between a State or the citizens thereof and foreign States, citizens or subjects." (Elliot's Deb. vol. 1. p. 224.)

It may be observed, in passing, that, in this draft, all disputes and controversies between two or more States, respecting jurisdiction or territory, are to be determined by a special court to be constituted by the Senate; and the controversies between two or more States, except such as shall regard territory or jurisdiction, are determinable by the Supreme Court. It is therefore apparent that other disputes or controversies between States were regarded and provided for besides those respecting territory or jurisdiction.

This draft, together with numerous suggestions and amendments, was on August 7 submitted to the committee of the whole.

On September 12 a committee on revision reported a draft of the Constitution as revised and arranged. This draft, which, as respects our present subject, was in the terms of the Constitution as finally adopted, took from the Senate the power to constitute a court to try disputes between the States respecting territory or jurisdiction,
and struck out the provision excluding from the jurisdiction
50 of the Supreme Court disputes between the States in matters
respecting jurisdiction and territory. The entire jurisdiction of controversies between States was bestowed upon the Supreme Court, in the second section of article three, in the following terms:

"The judicial power shall extend to all cases in law and equity, arising under this Constitution, the laws of the United States and the treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same State, claiming lands under grants of different States, and between a State or the citizens thereof, and foreign States, citizens or subjects.

"In all cases affecting ambassadors, other public ministers and consuls, and those in which a State shall be a party, the Supreme Court shall have original jurisdiction. In all other cases before mentioned the Supreme Court shall have appellate jurisdiction, both as to law and fact, with such exceptions, and under such regulations, as the Congress shall make."

As in this section power is conferred on Congress to make regulations affecting the exercise by the Supreme Court of its jurisdiction, it may not be out or place to quote the provisions in this respect of he judiciary act of 1789:

"The Supreme Court shall have exclusive jurisdiction of all controversies of a civil nature where a State is a party, except between a State and its citizens, or between a State and citizens of other States or aliens, in which latter cases it shall have original, but not exclusive jurisdiction." (Revised Stat., sec. 687.)

The case of New York *v.* Connecticut *et al.*, (4 Dall. 3,) in 1799, was the first instance of an exercise by the Supreme Court of its jurisdiction in a controversy between two States. It was a case of a bill in equity filed by the State of New York against the State of Connecticut and certain private persons who were grantees of the latter State of lands, the jurisdiction over which was claimed by both States. The object of the bill was to obtain an injunction to stay proceedings in ejectment pending in the circuit court of the United States for the district of Connecticut.

The court was of opinion that, as the State of New York was not a party to the suits below, nor interested in the decisions of those suits, an injunction ought not to issue. No argument was made that the court had not jurisdiction, and the court proceeded on the assumption that it possessed jurisdiction, although, under the facts of the case, it refused the injunction prayed for.

New Jersey *v.* New York, (5 Pet. 285,) was the case of a bill filed by the State of New Jersey against the State of New York for the purpose of ascertaining and settling the boundary between the two States. In an opinion awarding the process of subpœna Chief Justice Marshall said:

51 "The Constitution of the United States declares that 'the judicial power shall extend to controversies between two or more States.' It also declares that 'in all cases affecting ambassadors, other public ministers and consuls, and those in which a State shall be a party, the Supreme Court shall have original jurisdiction.' * * * It has been settled by our predecessors, in great deliberation, that this court may exercise its original jurisdiction in suits against a State, under the authority conferred by the Constitution and existing acts of Congress."

In March 1832, the State of Rhode Island filed in this court a bill against the State of Massachusetts, for the settlement of the boundary between the two States, and moved for a subpœna to be issued, according to the practice of the court in similar cases. An appearance was entered for Massachusetts, and a motion was made to dismiss the bill for want of jurisdiction. In support of the motion it was contended that this court had no jurisdiction because of the character of the respondent independent of the nature of the suit, and because of the nature of the suit independent of the character of the respondent. It was not denied that Massachusetts had agreed, by adopting the Federal Constitution, to submit her controversies with other States to judicial decision, but it was claimed that Congress had passed no law establishing a mode of proceeding, the character of the judgment to be rendered, and means of enforcing it. As respects the nature of the suit, it was argued that it was in its character political, brought by a sovereign, in that avowed character; that the judicial power of the United States extended, by the Constitution, only to cases of law and equity, and that questions of jurisdiction over territory were not cases of that kind, nor of "a civil nature."

The court held that jurisdiction was conferred by the Constitution and the judiciary act, and that, as Massachusetts had appeared, submitted to the process, and pleaded in bar of the plaintiff's action certain matters on which the judgment of the court was asked, all doubts as to jurisdiction over the parties were at rest.

As respected the power of the court to hear and determine the subject matters of the suit, it was held that jurisdiction existed; that the dispute was a controversy between two States within the judicial power of the United States. (12 Pet. 657; 13 Pet. 23.)

Before leaving this case it is to be remarked that the principal contest was as to whether a question of boundary, involving as it did the question of sovereignty over territory, was a judicial question of a civil nature. The implication was that the controversies between two or more States, in which jurisdiction had been granted by the Constitution, did not include questions of a political character. In some of the later cases the contention has been the very opposite; that the intention of the Constitution was only to apply to questions in which the sovereign and political powers of the respective States were in controversy.

52 In Florida *v.* Georgia, (11 How. 293,) leave was given by this court to the State of Florida to file a bill against the State of Georgia, and process of subpœna was directed to be issued against the State of Georgia. The object of the bill was to ascertain and establish the boundary between the two States, which was in controversy. The State of Georgia answered, and the cause was proceeded in in pursuance of the prayers of the bill. Subsequently an application was made by the Attorney General of the United States, alleging that the latter were interested and concerned in the matter in controversy, and moving the court that he be permitted to appear in the case, and be heard in behalf of the United States, in such time and form as the court should order. This motion was opposed by the States, and the matter was argued at length. The judges differed, but neither in the opinion of the majority, granting the motion of the Attorney General, nor in that of the dissenting minority, was any doubt expressed of the existence of the jurisdiction of the court over the controversy between the two States.

Pennsylvania *v.* Wheeling & Belmont Bridge Company, (9 How. 647;) *Idem v. Idem,* (11 How. 528;) *Idem v. Idem,* (13 How. 518;) *Idem v. Idem,* (18 How. 429,) was a case in equity, in which the State of Pennsylvania filed a bill against the Wheeling and Belmont Bridge Company, a corporation of Virginia, and certain contractors, charging that the defendants, under color of an act of the legislature of Virginia, were engaged in the construction of a bridge across the Ohio river at Wheeling, which would, as was alleged, obstruct its navigation to and from the ports of Pennsylvania, by steamboats and other crafts which navigated the same. Many different questions were discussed by counsel and considered by the court, respecting the nature and extent of the jurisdiction of this court, the right of the complainant State, whether at law or in equity, and the character of the decree which could be rendered. Several observations made in the opinion of the court will be hereafter adverted to when we come to consider the second ground of demurrer urged in the case before us. It is sufficient for our present purpose to say that the original jurisdiction of the court was sustained, a commissioner was appointed to take and report proofs, and a decree was entered declaring the bridge to be an obstruction of the free navigation of the river; that thereby a special damage was occasioned to the plaintiff, for which there was not an adequate remedy at law, and directing that the obstruction be removed, either by elevating the bridge to a height designated, or by abatement.

South Carolina *v.* Georgia, (93 U. S. 4,) was a suit in equity brought in this court, whereby the State of South Carolina sought an injunction to restrain the State of Georgia, the United States Secretary of War, the Chief Engineer of the United States Army, their agents and subordinates, from obstructing the navigation of the
53 Savannah river, in violation of an alleged compact subsisting between the States of South Carolina and Georgia, and which had been entered into on April 24, 1787. This court, not denying but assuming jurisdiction in the case, held that, by adopting the Federal Constitution, and thereby delegating to the General Government the right to regulate commerce with foreign nations and among the several States, the compact between the two States, in respect to the Savannah river, ceased to operate, and that the acts complained of, being done in pursuance of congressional authority, and designed to improve navigation, could not be deemed an illegal obstruction, and accordingly the special injunction previously granted was dissolved and the bill dismissed.

Wisconsin *v.* Duluth, (96 U. S. 372,) was the case of a bill in chancery filed in this court by the State of Wisconsin, by virtue of the constitutional provision which confers original jurisdiction of suits between the States and between a State and citizens of other States. The city of Duluth, a corporation and citizen of the State of Minnesota, was defendant; and, after answer, replication and the taking of a large amount of evidence, the case came on for a final decree. The nature of the case and the reasoning upon which this court proceeded in disposing of it will sufficiently appear in the following quotations from the opinion delivered by Mr. Justice Miller:

"The present suit was brought by the State of Wisconsin on the ground that the channel of the St. Louis river, as it flowed in a state of nature, was the common boundary between that State and the State of Minnesota, and that she had an interest in the continuance of the channel as an important highway for navigation and commerce in its natural and usual course; that the canal cut by Duluth across Minnesota point, deeper than the natural outlet of the St. Louis river at its mouth, has diverted, and will continue to divert, the current of that river through Superior bay into the lake by way of that canal; that the result of this is, that while the current cuts that canal deeper and gives an outlet for the water there at a lower level, it at the same time, by diverting the current from the old outlet, causes it to fill up, and thus destroy the usefulness of the river and bay as an aid of commerce, on which the State had a right to rely. The bill, after reciting the facts which we have already detailed, insists that the city of Duluth cannot, by any right of her own, nor by any authority conferred on her by the State of Minnesota, thus divert the waters of the stream—the St. Louis river—from their natural course, to the prejudice of the rights of the State of Wisconsin or of her citizens; declares that this canal at Duluth does this in violation of law; and it prays of this court to enjoin Duluth from protecting or maintaining it, and by way of mandatory injunction to compel that city to fill up the canal and restore things in that regard to the condition of nature in which they were before the canal was made.

"The answer, while admitting the construction of the canal, denies almost every other material allegation of the bill. It denies especially that the canal has the effect of changing the course of
54 the current of the river, or does any injury to the southern
entrance to Superior bay or diminishes the flow of water at that point. A large amount of testimony, professional and non-professional, is presented on that subject.

"The answer also sets up, as an affirmative defense to the relief sought by the bill, that the United States, by the legislative and executive departments of the Government, have approved of the construction of the canal, have taken possession and control of the work, have appropriated and spent money on it, and adopted it as the best mode of making a safe and accessible harbor at the western end of the great system of lake navigation.

"Many interesting questions have been argued, and ably argued, by counsel, which we have not found it necessary to decide. The counsel for defense deny that the State of Wisconsin has any such legal interest in the flow of the waters in their natural course as authorizes her to maintain a suit for their division. It is argued that this court can take cognizance of no question which concerns alone the rights of a State in her political or sovereign character; that to sustain this suit she must have some proprietary interest which is affected by the defendant. This question has been raised and discussed in almost every case brought before us by a State, in virtue of the original jurisdiction of the court. We do not find it necessary to make any decision on the point as applicable to the case before us. Nor shall we address ourselves to the consideration of the mass of conflicting evidence as to the effect of the canal on the flow of the waters of Superior bay.

"We will first consider the affirmative defense already mentioned;

for, if that be found to be true in point of fact, it will preclude any such action by this court as the plaintiff has prayed for."

The court then proceeded to inquire into the action of the General Government in the matter of the canal in question, and found that, as matter of fact, the United States had taken possession and control of the canal as a public work. The opinion concluded as follows:

"If, then, Congress, in the exercise of a lawful authority, has adopted and is carrying out a system of harbor improvements at Duluth, this court can have no lawful authority to forbid the work. If that body sees fit to provide a way by which the great commerce of the lakes and the countries west of them, even to Asia, shall be securely accommodated at the harbor of Duluth by this short canal of three or four hundred feet, can this court decree that it must forever pursue the old channel, by the natural outlet, over water too shallow for large vessels, unsafe for small ones, and by a longer and much more tedious route?

"When Congress appropriates $10,000 to improve, protect and secure this canal, this court can have no power to require it to be filled up and obstructed. While the engineering officers of the Government are, under the authority of Congress, doing all they can to make this canal useful to commerce and to keep it in good condition, this court can owe no duty to a State which requires it to order the city of Duluth to destroy it.

"These views show conclusively that the State of Wisconsin is not entitled to the relief asked by the bill, and that it must, therefore, be dismissed with costs."

The court, therefore, did not decline jurisdiction, but exercised it, by inquiring into the facts put in issue by the bill and answer, and by dismissing the bill for want of equity.

55 In Virginia *v.* West Virginia, (11 Wall. 39,) a bill was filed in this court to settle the boundaries between the two States. There was a demurrer to the bill. In delivering the opinion of the court Mr. Justice Miller said:

"The first proposition on which counsel insist in support of the demurrer is that this court has no jurisdiction of the case, because it involves the consideration of questions purely political; that is to say, that the main question to be decided is the conflicting claims of the two States to the exercise of political jurisdiction and sovereignty over the territory and inhabitants of the two counties which are the subject of dispute. This proposition cannot be sustained without reversing the settled course of decision in this court and overturning the principles on which several well-considered cases have been decided."

And, after citing Rhode Island *v.* Massachusetts, (12 Pet. 794;) Missouri *v.* Iowa, (7 How. 660;) Florida *v.* Georgia, (17 *id.* 478,) and Alabama *v.* Georgia, (23 *id.* 505,) the conclusion of the court was thus expressed:

"We consider, therefore, the established doctrine of this court to be that it has jurisdiction of questions of boundary between two States of this Union, and that this jurisdiction is not defeated because in deciding that question it becomes necessary to examine into and construe compacts and agreements between those States, or because the decree which the court may render affects the territorial limits of the political jurisdiction and sovereignty of the States which are parties to the proceeding."

In New Hampshire *v.* Louisiana and others, and New York *v.* Louisiana and others, (108 U. S. 76,) it was found that, in view of the eleventh amendment to the Constitution of the United States, declaring that "the judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens and subjects of any foreign State," as matter of fact, under the pleadings and testimony, the suits were commenced and were prosecuted solely by the owners of the bonds and coupons, to collect which was the object of the suits, and it was accordingly held "that the evident purpose of the amendment, so promptly proposed and finally adopted, was to prohibit all suits against a State by or for citizens of other States or aliens, without the consent of the State to be sued, and, in our opinion, one State cannot create a controversy with another State, within the meaning of that term as used in the judicial clauses of the Constitution, by assuming the prosecution of debts, owing by the other State to its citizens. Such being the case we are satisfied that we are prohibited, both by the letter and the spirit of the Constitution, from entertaining these suits, and the bill in each case is dismissed."

In Wisconsin *v.* Pelican Insurance Company, (127 U. S. 265,) the nature of the case and of the question involved was thus stated by Mr. Justice Gray, in delivering the opinion of the court:

56 "This action is brought upon a judgment recovered by the State of Wisconsin in one of her own courts against the Pelican Insurance Company, a Louisiana corporation, for penalties imposed by a statute of Wisconsin for not making returns to the insurance commissioner of the State, as required by that statute. The leading question argued at the bar is whether such an action is within the original jurisdiction of this court.

"The ground on which the jurisdiction is invoked is not the nature of the cause, but the character of the parties, the plaintiff being one of the States of the Union, and the defendant a corporation of another of three States."

After citing and considering the cases, the justice expressed the following conclusions:

"The rule that the courts of no country execute the penal laws of another applies not only to prosecutions and sentences for crimes and misdemeanors, but to all suits in favor of the State for the recovery of pecuniary penalties for any violation of statutes for the protection of its revenue, or other municipal laws, and to all judgments for such penalties. * * * From the first organization of the courts of the United States, nearly a century ago, it has always been assumed that the original jurisdiction of this court over controversies between a State and citizens of another State, or of a foreign country, does not extend to a suit by a State to recover penalties for a breach of her own municipal law. * * * The statute of Wisconsin, under which the State recovered in one of her own courts the judgment now and here sued on, was in the strictest sense a penal statute, imposing a penalty upon any insurance company of another State, doing business in the State of Wisconsin without having deposited with the proper officer of the State a full statement of its property and business during the previous year. The cause of action was not any private injury, but solely the offense committed against the State by violating her law. * * * This court, therefore, cannot entertain an original action to compel the defendants to pay the State of Wisconsin a sum of money in satisfaction of the judgment for that fine."

And consequently judgment was entered for the defendant on the demurrer that had been interposed to the declaration.

Hans *v.* Louisiana, (134 U. S. 1,) was an action brought in the circuit court of the United States for the eastern district of Louisiana, against the State of Louisiana, by Hans, a citizen of that State, to recover the amount of certain coupons annexed to bonds of the State. The circuit court, on motion of the attorney general of the State, dismissed the case for want of jurisdiction. This court affirmed the judgment of the circuit court, and held that the judicial power of the United States did not extend to the case of a suit brought against a State by one of its own citizens.

In the course of the opinion, delivered by Mr. Justice Bradley, the following observations were made:

"The truth is, that the cognizance of suits and actions unknown to the law, and forbidden by the law, was not contemplated by the Constitution when establishing the judicial power of the 57 United States. Some things, undoubtedly, were made justiciable which were not known as such at the common law; such, for example, as controversies between States as to boundary lines, and other questions admitting of judicial solution. And yet the case of Penn *v.* Lord Baltimore, (1 Vesey, Sen. 444,) shows that some of these unusual subjects of litigation were not unknown to the courts even in colonial times; and several cases of the same general character arose under the articles of confederation, and were brought before the tribunal provided for that purpose by those articles. (131 U. S. App. 1.) The establishment of this new branch of jurisdiction seemed to be necessary from the extinguishment of diplomatic relations between the States. Of other controversies between a State and another State, or its citizens, which, on the settled principles of public law, are not subjects of judicial cognizance, this court has often declined to take jurisdiction. See Wisconsin *v.* Pelican Ins. Co., (127 U. S. 265, 288, 289,) and cases there cited."

The last case which we have had occasion to examine is that of

Louisiana *v.* Texas, (176 U. S. 1, 15). The case was brought before us by a bill in equity, filed by the State of Louisiana against the State of Texas, her governor and her health officer. The bill alleged that the State of Texas had granted to its governor and its health officer extensive powers over the establishment and maintenance of quarantines over infectious and contagious diseases; that this power had been exercised in a way and with a purpose to build up and benefit the commerce of cities in Texas, which were business rivals of the city of New Orleans, and prayed for a decree that neither the State of Texas, nor her governor, nor her health officer, have the right, under the cover of an exercise of police or quarantine powers, to declare and enforce an embargo against interstate commerce between the State of Louisiana, or any part thereof, and the State of Texas, or the right to make discriminative rules affecting the State of Louisiana, or any part thereof, and different from and more burdensome than the quarantine rules and regulations applied to other States and countries; and the bill asked for an injunction restraining the Texas officials from enforcing the Texas laws in the manner in which they were enforced. To this bill a demurrer was filed, assigning the following causes:

"First. That this court has no jurisdiction of either the parties to or of the subject matter of this suit, because it appears from the face of the bill that the matters complained of do not constitute, within the meaning of the Constitution of the United States, any controversy between the States of Louisiana and Texas. Second. Because the allegations of the bill show that the only issues presented by said bill arise between the State of Texas or her officers, and certain persons in the city of New Orleans, in the State of Louisiana, who were engaged in interstate commerce, and which do not in any manner concern the State of Louisiana as a corporate body or State. Third. Because such bill shows upon its face that this suit is in reality for and on behalf of certain individuals engaged in interstate commerce, and while the suit is attempted to be prosecuted for and in the name
of the State of Louisiana, said State is in effect loaning its
58 name to said individuals and is only a nominal party—the
real parties at interest being said individuals in the city of New Orleans who are engaged in interstate commerce. Fourth. Because it appears from the face of said bill that the State of Louisiana, in her right of sovereignty, is seeking to maintain this suit for the redress of the supposed wrongs of her citizens in regard to interstate commerce, while under the Constitution and laws the said State possesses no such sovereignty as empowers her to bring an original suit in this court for such purpose. Fifth. Because it appears from the face of the bill that no property rights of the State of Louisiana are in any manner affected by the quarantine complained of, nor is any such property right involved in this suit as would give this court original jurisdiction of this cause."

In the opinion of the court, delivered by Mr. Chief Justice Fuller, after a consideration of the cases hereinbefore mentioned and of others, it was said:

"In order then to maintain jurisdiction of this bill of complaint, as against the State of Texas, it must appear that the controversy to be determined is a controversy arising directly between the State of Louisiana and the State of Texas, and not a controversy in the vindication of grievances of particular individuals.

"By the Constitution the States are forbidden to enter into any treaty, alliance or confederation; grant letters of marque and reprisal, or, without the consent of Congress, 'keep troops or ships of war in time of peace, enter into any agreement or compact with another State or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.'

"Controversies between them arising out of public relations and intercourse cannot be settled either by war or diplomacy, though, with the consent of Congress, they may be composed by agreement. * * *

"In the absence of agreement it may be that a controversy might arise between two States for the determination of which the original jurisdiction of this court would be invoked, but there must be a direct issue between them, and the subject matter must be susceptible of judicial solution. And it is difficult to conceive of a direct issue between two States in respect of a matter where no effort at accommodation has been made; nor can it be conceded that it is within the judicial function to inquire into the motives of a State legislature in passing a law, or of the chief magistrate of a State in enforcing it in the exercise of his discretion and judgment. Public policy forbids the imputation to authorized official action of any other than legitimate motives. * * *

"But in Debs, petitioner, (158 U. S. 564,) involving a case in the circuit court, in which the United States had sought relief by injunction, it was observed: 'That while it is not the province of the Government to interfere in any matter of private controversy between individuals, or to use its great powers to enforce the rights of one against another, yet, whenever the wrongs complained of are such as to affect the public at large, and are in respect of matters which by the Constitution are entrusted to the care of the nation, and concerning which the nation owes its duty to all the citizens of securing to them their common rights, then the mere fact that the Government has no pecuniary interest in the controversy is not sufficient to exclude it from the courts or prevent it from taking measures therein to fully discharge those constitutional duties.'

59 "It is in this aspect that the bill before us is framed. Its gravamen is not a special and peculiar injury such as would sustain an action by a private person, but the State of Louisiana presents herself in the attitude of *parens patriæ*, trustee, guardian or representative of all her citizens. She does this from the point of view that the State of Texas is intentionally absolutely interdicting interstate commerce as respects the State of Louisiana by means of

unnecessary and unreasonable quarantine regulations. Inasmuch as the vindication of the freedom of interstate commerce is not committed to the State of Louisiana, and that State is not engaged in such commerce, the cause of action must be regarded not as involving any infringement of the powers of the State of Louisiana, or any special injury to her property, but as asserting that the State is entitled to relief in this way because the matters complained of affect her citizens at large. Nevertheless if the case stated is not one presenting a controversy between these States, the exercise of original jurisdiction by this court as against the State of Texas cannot be maintained."

After quoting the provisions of the statute of the State of Texas regulating the subject of quarantine, the chief justice proceeded to say:

"It is not charged that this statute is invalid, nor could it be if tested by its terms. While it is true that the power vested in Congress to regulate commerce among the States is a power complete in itself, acknowledging no limitations other than those prescribed in the Constitution, and that where the action of the States in the exercise of their reserved powers comes into collision with it, the latter must give way, yet it is also true that quarantine laws belong to that class of State legislation which is valid until displaced by Congress, and that such legislation has been expressly recognized by the laws of the United States almost from the beginning of the Government. * * * The complaint here, however, is not that the laws of Texas in respect of quarantine are invalid, but that the health officer, by rules and regulations framed and put in force by him thereunder, places an embargo in fact on all interstate commerce between the State of Louisiana and the State of Texas, and that the governor permits these rules and regulations to stand and be enforced, although he has the power to modify or change them. The bill is not rested merely on the ground of the imposition of an embargo without regard to motive, but charges that the rules and regulations are more stringent than called for by the particular exigency, and are purposely framed with the view to benefit the State of Texas, and the city of Galveston in particular, at the expense of the State of Louisiana, and especially of the city of New Orleans.

"But in order that a controversy between States, justiciable in this court, can be held to exist, something more must be put forward than that the citizens of one State are injured by the maladministration of the laws of another. The States cannot make war, or enter into treaties, though they may, with the consent of Congress, make compacts and agreements. Where there is no agreement, where breach might create it, a controversy between States does not arise unless the action complained of is State action, and acts of State officers in abuse or excess of their powers cannot be laid hold of as in themselves committing one State to a distinct collision with a sister State.

"In our judgment, this bill does not set up facts which show that

the State of Texas has so authorized or confirmed the alleged
60 action of her health officer as to make it her own, or from
which it necessarily follows that the two States are in controversy within the meaning of the Constitution.

"Finally, we are unable to hold that the bill may be maintained as presenting a case of controversy 'between a State and citizens of another State.' Jurisdiction over controversies of that sort does not embrace the determination of political questions, and, where no controversy exists between States, it is not for this court to restrain the governor of a State in the discharge of his executive functions in a matter lawfully confided to his discretion and judgment. Nor can we accept the suggestion that the bill can be maintained as against the health officer alone on the theory that his conduct is in violation or in excess of a valid law of the State, as the remedy for that would clearly lie with the State authorities, and no refusal to fulfill their duty in that regard is set up. In truth it is difficult to see how on this record there could be a controversy between the State of Louisiana and the individual defendants without involving a controversy between the States, and such a controversy, as we have said, is not presented."

Accordingly the demurrer was sustained and bill dismissed.

From the language of the Constitution, and from the cases in which that language has been considered, what principles may be derived as to the nature and extent of the original jurisdiction of this court in controversies between two or more States?

From the language, alone considered, it might be concluded that whenever, and in all cases where one State may choose to make complaint against another, no matter whether the subject of complaint arises from the legislation of the defendant State, or from acts of its officers and agents, and no matter whether the nature of the injury complained of is to affect the property rights or the sovereign powers of the complaining State, or to affect the rights of its citizens, the jurisdiction of this court would attach.

Chief Justice Marshall in the case of Cohens *v.* Virginia, (6 Wheat. 364, 392,) said:

"The Constitution gives the Supreme Court original jurisdiction in certain enumerated cases, and gives it appellate jurisdiction in all others. Among those in which jurisdiction must be exercised in the appellate form are cases arising under the Constitution and laws of the United States. These provisions of the Constitution are equally obligatory, and are to be equally respected. If a State be a party, the jurisdiction of this court is original; if the case arise under a constitution or a law, the jurisdiction is appellate. But a case to which a State is a party may arise under the Constitution or a law of the United States. What rule is applicable to such a case? What, then, becomes the duty of the court? Certainly, we think, so to construe the Constitution as to give effect to both provisions, as far as possible to reconcile them, and not to permit their seeming repugnancy to destroy each other. We must endeavor so to construe them as to preserve the true intent and meaning of the instrument.

"In one description of cases the jurisdiction of the court is founded entirely on the character of the parties, and the nature of the
61 controversy is not contemplated by the Constitution. The character of the parties is everything, the nature of the case nothing. In the other description of cases the jurisdiction is founded entirely on the character of the case, and the parties are not contemplated by the Constitution. In these the nature of the case is everything, the character of the parties nothing. When, then, the Constitution declares the jurisdiction, in cases where a State shall be a party, to be original, and in all cases arising under the Constitution or a law to be appellate, the conclusion seems irresistible that its framers designed to include in the first class those cases in which jurisdiction is given, because a State is a party; and to include in the second those in which jurisdiction is given, because the case arises under the Constitution or a law."

But it must be conceded that upon further consideration, in cases arising under different states of facts, the general language used in Cohens *v.* Virginia has been, to some extent, modified. Thus, in the cases of New Hampshire *v.* Louisiana, and New York *v.* Louisiana, *ut supra*, jurisdiction was denied to this court where the cause of action belonged to private persons, who were endeavoring to use the name of one State to enforce their rights of action against another. Though, perhaps, it may be said that jurisdiction was really entertained, and that the bills were dismissed, because the court found that, under the pleadings and testimony, the States complainant had no interest of any kind in the proceedings.

So, too, in Wisconsin *v.* Pelican Insurance Company, *ut supra*, the court held that, notwithstanding the action was brought by a State against the citizens of another State and was thus within the letter of the Constitution, yet that the court had a right to inquire into the nature of the case, and, when it found that the object of the suit was to enforce the penal laws of one State against a citizen of another, to refuse to exercise jurisdiction.

In the case of Louisiana *v.* Texas, *ut supra*, the bill was dismissed because a controversy between the two States was not actually presented; that what was complained of was not any action of the State of Texas, but the alleged unauthorized conduct of its health officer, acting with a malevolent purpose against the city of New Orleans. Here again it may be observed that the court did not decline jurisdiction, but exercised it in holding that the facts alleged in the bill did not justify the court in granting the relief prayed for.

The cases cited show that such jurisdiction has been exercised in cases involving boundaries and jurisdiction over lands and their inhabitants, and in cases directly affecting the property rights and interests of a State. But such cases manifestly do not cover the entire field in which such controversies may arise, and for which the Constitution has provided a remedy; and it would be objectionable, and, indeed, impossible, for the court to anticipate by definition what controversies can and what cannot be brought within the original jurisdiction of this court.

An inspection of the bill discloses that the nature of the injury complained of is such that an adequate remedy can only be
62 found in this court at the suit of the State of Missouri. It is true that no question of boundary is involved, nor of direct property rights belonging to the complainant State. But it must surely be conceded that, if the health and comfort of the inhabitants of a State are threatened, the State is the proper party to represent and defend them. If Missouri were an independent and sovereign State all must admit that she could seek a remedy by negotiation, and, that failing, by force. Diplomatic powers and the right to make war having been surrendered to the General Government, it was to be expected that upon the latter would be devolved the duty of providing a remedy and that remedy, we think, is found in the constitutional provisions we are considering.

The allegations of the bill plainly present such a case. The health and comfort of the large communities inhabiting those parts of the State situated on the Mississippi river are not alone concerned, but contagious and typhoidal diseases introduced in the river communities may spread themseves throughout the territory of the State. Moreover substantial impairment of the health and prosperity of the towns and cities of the State situated on the Mississippi river, including its commercial metropolis, would injuriously affect the entire State.

That suits brought by individuals, each for personal injuries, threatened or received, would be wholly inadequate and disproportionate remedies, requires no argument.

It is further contended, in support of the demurrer, that even if the State of Missouri be the proper party to file such a bill, yet that the proper defendant is the Sanitary District of Chicago solely, and that the State of Illinois should not have been made a party, and that, as to her, the demurrer ought to be sustained.

It can scarcely be supposed, in view of the express provisions of the Constitution and of the cited cases, that it is claimed that the State of Illinois is exempt from suit because she is a sovereign State which has not consented to be sued. The contention rather seems to be that, because the matters complained of in the bill proceed and will continue to proceed from the acts of the Sanitary District of Chicago, a corporation of the State of Illinois, it therefore follows that the State, as such, is not interested in the question, and is improperly made a party.

We are unable to see the force of this suggestion. The bill does not allege that the sanitary district is acting without or in excess of lawful authority. The averment and the conceded facts are that the corporation is an agency of the State to do the very things which, according to the theory of the complainant's case, will result in the mischief to be apprehended. It is State action and its results

that are complained of—thus distinguishing this case from that of Louisiana *v.* Texas, where the acts sought to be restrained
63 were alleged to be those of officers or functionaries proceeding in a wrongful and malevolent misapplication of the quarantine laws of Texas. The Sanitary District of Chicago is not a private corporation, formed for purposes of private gain, but a public corporation, whose existence and operations are wholly within the control of the State.

The object of the bill is to subject this public work to judicial supervision, upon the allegation that the method of its construction and maintenance will create a continuing nuisance, dangerous to the health of a neighboring State and its inhabitants. Surely, in such a case, the State of Illinois would have a right to appear and traverse the allegations of the bill, and, having such a right, might properly be made a party defendant.

It is further contended that, even if this court has original jurisdiction of the subject matter, and even if the respective States have been properly made parties, yet the case made out by the bill does not entitle the State of Missouri to the equitable relief prayed for.

This proposition is sought to be maintained by several considerations. In the first place, it is urged that the drawing, by artificial means, of the sewage of the city of Chicago into the Mississippi river may or may not become a nuisance to the inhabitants, cities and towns of Missouri; that the injuries apprehended are merely eventual or contingent, and may, in fact, never be inflicted. Can it be gravely contended that there are no preventive remedies, by way of injunction or otherwise, against injuries not inflicted or experienced, but which would appear to be the natural result of acts of the defendant, which he admits or avows it to be his intention to commit?

The bill charges that the acts of the defendants, if not restrained, will result in the transportation, by artificial means and through an unnatural channel, of large quantities of undefecated sewage daily, and of accumulated deposits in the harbor of Chicago and in the bed of the Illinois river, which will poison the water supply of the inhabitants of Missouri and injuriously affect that portion of the bed or soil of the Mississippi river which lies within its territory.

In such a state of facts, admitted by the demurrer to be true, we do not feel it necessary to enter at large into a discussion of this part of the defendants' contention, but think it sufficient to cite one or two authorities.

Attorney General *v.* Jamaica Pond Aqueduct Co., (133 Mass. 361,) was a proceeding in equity in the supreme judicial court to enjoin the defendants from lowering the water in one of the public ponds of Massachusetts. It was claimed that the necessary effect of such lowering would be to impair the rights of the people in the use of the pond for fishing, boating and other lawful purposes, and to create and expose upon the shores of the pond a large quantity of slime, mud and offensive vegetation, detrimental to the public health,

The defendants demurred, claiming that no case was stated which
came within the equity jurisdiction of the court, and ques-
64 tioning the power of the attorney general, on behalf of the
Commonwealth, to maintain the proceedings. Speaking for
the court the chief justice said:

"The cases are numerous in which it has been held that the attorney general may maintain an information in equity to restrain a corporation exercising the right of eminent domain under a power delegated to it by the legislature, from any abuse or perversion of the powers which may create a public nuisance or injuriously affect or endanger the public interests,"—citing many cases, and proceeding:

"The information in this case alleges not only that the defendant is doing acts which are *ultra vires*, and an abuse of the power granted to it by the legislature, but also that the necessary effect of said acts will be to create a public nuisance. This brings the case within the established principle that the court has jurisdiction in equity to restrain and prevent nuisances. And when the nuisance is a public one an information by the attorney general is the appropriate remedy. This information, therefore, can be sustained on the ground that the unlawful acts of the defendant will produce a public nuisance by partially draining the pond and exposing its shores, thus endangering the public health."

And replying to the claim that resort to equity was unnecessary, the court further said:

"The defendant contends that the law furnishes a plain, adequate and complete remedy for this nuisance by an indictment or by proceedings under the statutes for the abatement of a nuisance by the board of health. Neither of these remedies can be invoked until a part of the mischief is done, and they could not, in the nature of things, restore the pond, the land and the underground currents to the same condition in which they now are. In other words, they could not remedy the whole mischief. The preventive force of a decree in equity, restraining the illegal acts before any mischief is done, gives clearly a more efficacious and complete remedy."

The nature of equitable remedy in the case of public nuisances was well described by Mr. Justice Harlan, speaking for the court in the case of Mugler *v.* Kansas, (123 U. S. 623, 673):

"The grounds of this jurisdiction, in cases of purpresture, as well as of public nuisances, is the ability of courts of equity to give a more speedy, effectual and permanent remedy than can be had at law. They cannot only prevent nuisances that are threatened, and before irreparable mischief ensues, but arrest or abate those in progress, and by perpetual injunction protect the public against them in the future; whereas courts of law can only reach existing nuisances, leaving future acts to be the subjects of new prosecutions or proceedings. This is a statutory jurisdiction, especially where a nuisance affects the health, morals or safety of the community."

In Coosaw Mining Co. *v.* South Carolina, (144 U. S. 550,) it was said by this court, through Mr. Justice Harlan, after citing English and American cases:

"Proceedings at law or by indictment can only reach past or present wrongs done by appellant, and will not adequately protect the public interests in the future. What the public are en-
65 titled to have is security for all time against illegal interference with the control by the State of the digging, mining and removing of phosphate rock and phosphatic deposits in the bed of Coosaw river."

It is finally contended that, if the bill was not prematurely filed, then it was filed too late; that, by standing by for so long a period, the complainant was guilty of such laches that a court of equity will not grant relief.

The inconsistency between these contentions is manifest, and, on consideration, we are of opinion that the suggestion that the complainant's remedy has been lost by delay, is not founded in fact or reason.

In Goldsmid *v.* Tunbridge Wells, (L. R. 1 Eq. 161,) answering a similar contention, it was said by Romilly, M. R.:

"If the plaintiff comes to the court and complains very early, then the evidence is that the pollution is not perceptible, it is wholly inappreciable, and you get evidence after evidence for the defendants, (the pollution being slight and perhaps only observable at some times and on some occasions,) saying you have no proof at all that there is any appreciable pollution, and you must wait until it becomes a nuisance. Then he waits for five or six years, until it is obvious to everybody's sense that the pollution is considerable, and then they say 'You have come too late, you have allowed this to continue on for twenty years, and we have acquired an easement over your property, and the right of pouring the sewage into it.' My opinion is that any person who has a water course flowing through his land, and sewage which is perceptible is brought into that water course, has a right to come here to stop it; and that when the pollution is increasing, and gradually increasing from time to time, by the additional quantity of sewage poured into it, the persons who allow the polluted matter to flow into the stream are not at liberty to claim any right or prescription against him. * * *

"This is a matter of very great importance, and it has been suggested to me in argument as a matter that ought to be regarded that private interests must give way to public interests; that the court ought to regard what the advantage to the public is, and that some little sacrifice ought to be made by private individuals. I do not assent to that view of the law on the subject, and I apprehend that the observations which were quoted to me of Vice Chancellor Sir William Page Wood, in the Attorney General *v.* The Mayor of Kingston, (13 W. R. 888,) are perfectly accurate, and that private rights are not to be interfered with. But my firm conviction is that in this, as in all the great dispensations and operations of nature, the interests of the individuals are not only compatible with but

identical with the interests of the public; and although in this case I have only to consider an injury to the private individual, the plaintiff in the present action, yet I believe that the injury to the public may be extremely great by polluting a stream which flows for a considerable distance, the water of which cattle are in the habit of drinking, the exhalations from which persons who reside on the banks must necessarily inhale, and this at a time when the attention of the people and the court is necessarily called to the fact that the most scientific men who have examined the subject are unable to say
whether great diseases among cattle and contagious diseases
66 affecting human beings, such as cholera, and typhus, and the
like, may not in a great measure be communicated or aggravated by the absorption of particles of feculent matter into the system, which are either inappreciable or scarcely appreciable by the most minute chemical analysis. It is impossible in that state of things to say what amount of injury may be done by polluting even partially a stream which flows a considerable distance. I am of opinion that Mr. Goldsmid was not bound to remain quiet until this stream had become such a nuisance that it was obvious to everybody near its banks; and the result is that he is entitled to a decree for an injunction to restrain the defendants from causing or permitting the sewage and other offensive matters from the town of Tunbridge Wells to be discharged into the Calverly brook, or stream, in such a manner as to affect the waters of the brook as it flows through the plaintiff's land."

This decree of the master of the rolls was subsequently affirmed on appeal. (1 Ch. L. R. 348.)

Similar views prevailed in Chapman *v.* City of Rochester, (110 N. Y. 273,) where a bill was filed to enjoin the defendant city from polluting, by the discharge of sewage by artificial means, a natural stream flowing through his lands.

In the opinion of the New York court of appeals, it was said by Danforth, J., after citing the Goldsmid *v.* Turnbridge Wells:

"In view of the principle upon which this and like decisions turn, the objections of the learned counsel for the defendant against the judgment appealed from are quite unimportant. The filth of the city does not naturally flow to the grounds of the plaintiff, as surface water finds its level, but is carried thither by artificial arrangements, prepared by the city, and for which it is responsible. Nor is the plaintiff estopped by acquiescence in the proceedings of the city in devising and carrying out its system of sewage. The principle invoked by the appellant has no application. It does not appear that the plaintiff in any way encouraged the adoption of that system, or by any act or word induced the city authorities to so direct the sewers that the flow from them should reach his premises. There is no finding to that effect, and the record contains no evidence. In fine, the case comes within the general rule, which gives to a person injured by the pollution of air or water, to the use of which, in its natural condition, he is entitled, an action against the party, whether it be a natural person or corporation who causes that pollution."

Cases cited by defendants' counsel, where injunctions were refused to aid in the suppression of public nuisances, were cases where the act complained of was fully completed, and where the nuisance was not one resulting from conduct repeated from day to day. Most of them were cases of purpresture, and concerned permanent structures already existing when courts in equity were appealed to.

The bill in this case does not assail the drainage canal as an unlawful structure, nor aim to prevent its use as a waterway. What is sought is relief against the pouring of sewage and filth through it, by artificial arrangements, into the Mississippi river, to the
67 detriment of the State of Missouri and her inhabitants, and the acts are not merely those that have been done, or which when done cease to operate, but acts contemplated as continually repeated from day to day. The relief prayed for is against not merely the creation of a nuisance but against its maintenance.

Our conclusion, therefore, is that the demurrers filed by the respective defendants cannot be sustained. We do not wish to be understood as holding that, in a case like the present one, where the injuries complained of grow out of the prosecution of a public work, authorized by law, a court of equity ought to interpose by way of preliminary or interlocutory injunction, when it is denied by answer that there is any reasonable foundation for the charges contained in the bill. We are dealing with the case of a bill alleging, in explicit terms, that damage and irreparable injury will naturally and necessarily be occasioned by acts of the defendants, and where the defendants have chosen to have their rights disposed of, so far as the present hearing is concerned, upon the assertions of this bill.

We fully agree with the contention of defendants' counsel that it is settled that an injunction to restrain a nuisance will issue only in cases where the fact of nuisance is made out upon determinate and satisfactory evidence; that if the evidence be conflicting and the injury be doubtful, that conflict and doubt will be a ground for withholding an injunction; and that, where interposition by injunction is sought, to restrain that which is apprehended will create a nuisance of which its complainant may complain, the proofs must show such a state of facts as will manifest the danger to be real and immediate. But such observations are not relevant to the case as it is now before us.

The demurrers are overruled, and leave is given to the defendants to file answers to the bill.

68 Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
No. 5, Original.

(January 28, 1901.)

Mr. Chief Justice FULLER, with whom concurred Mr. Justice Harlan and Mr. Justice White, dissenting:

Controversies between the States of this Union are made justiciable by the Constitution because other modes of determining them were surrendered; and before that jurisdiction, which is intended to supply the place of the means usually resorted to by independent sovereignties to terminate their differences, can be invoked, it must appear that the States are in direct antagonism as States. Clearly this bill makes out no such state of case.

If, however, on the case presented, it was competent for Missouri to implead the State of Illinois the only ground on which it can be rested is to be found in the allegation that its governor was about to authorize the water to be turned into the drainage channel.

The Sanitary District was created by an act of the General Assembly of Illinois, and the only authority of the State having any control and supervision over the channel is that corporation. Any other control or supervision lies with the lawmaking power of the State of Illinois, and I cannot suppose that complainant seeks to coerce that. It is difficult to conceive what decree could be entered in this case which would bind the State of Illinois or control its action.

The governor, it is true, was empowered by the act to authorize the water to be let into the channel on the receipt of a certificate, by commissioners appointed by him to inspect the work, that the channel was of the capacity and character required. This was done, and the water was let in on the day when the application was made to this court for leave to file the bill. The governor had discharged his duty, and no official act of Illinois, as such, remained to be performed.

Assuming that a bill could be maintained against the Sanitary District in a proper case, I cannot agree that the State of Illinois would be a necessary or proper party, or that this bill can be maintained against the corporation as the case stands.

69 The act complained of is not a nuisance, *per se*, and the injury alleged to be threatened is contingent. As the channel has been in operation for a year, it is probable that the supposed basis of complaint can now be tested. But it does not follow that the bill in its present shape should be retained.

In my opinion both the demurrers should be sustained, and the bill dismissed, without prejudice to a further application, as against the Sanitary District, if authorized by the State of Missouri.

My brothers Harlan and White concur with me in this dissent.

70 And on the same day, to wit, on the 28th day of January, A. D. 1901, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
} No. 5, Original.

On motion of Mr. William M. Springer, of counsel for the defendants, it is ordered by the court that the answers of the defendants herein be filed.

71 And on the same day, to wit, on the 28th day of January, A. D. 1901, the answer of the defendant, The State of Illinois, was filed in the words and figures following, viz:

72 In the Supreme Court of the United States, October Term, 1900.

STATE OF MISSOURI, Complainant,
v.
STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
} Number 5, Original.

Separate Answer of the State of Illinois to the Bill of Complaint of the said State of Missouri.

Now comes the State of Illinois by Edward C. Akin, attorney general of the State of Illinois, not waiving the demurrer filed herein, and in which this defendant joins but wholly relying thereon, for answer to so much of said bill of complaint as it is advised it is material and necessary for this defendant to answer unto, does say:

That this defendant, The State of Illinois, has by its attorney general, read the separate answer of The Sanitary District of Chicago, its co-defendant, and that in so far as said separate answer admits certain allegations contained in the complainant's bill of complaint, filed herein, this defendant, The State of Illinois, makes the 73 same admissions in this its separate answer without repeating the same admissions to said answer of its co-defendant thereon. That this defendant, The State of Illinois, as to all allegations contained in said bill of complaint, which are specifically denied by the separate answer of its co-defendant, filed herein, unites in such denial and makes said bill of complaint its own in this respect. And furthermore, this defendant unites with its co-defendant in making the allegations of new matter by way of defense set up by its co-defendant in its answer, filed herein, and makes said allegations its own in so far as this defendant is required to make answer to said bill of complaint; and this defendant refers this honorable court to the separate answer of its co-defendant, filed herein, and makes said answer its own, in so far as this defendant, The State of Illinois, is required to make answer in this cause.

This defendant avers that the laws of the State of Illinois, mentioned in its co-defendant's answer, and filed as exhibits therein, were passed by the General Assembly of the said State of Illinois, at the times mentioned, in pursuance of the authority vested in said General Assembly, and that the said acts are valid under the constitution of the State of Illinois, and that said General Assembly was clothed with ample authority by the constitution of the State of Illinois to pass said laws; and that the passage thereof was a proper and constitutional exercise of the power conferred upon said General Assembly.

And for further answer herein, this defendant avers that The Sanitary District of Chicago, its co-defendant, in exercising the authority conferred upon it by the laws of the State of Illinois, is not subject to the control of the executive department of the State of Illinois, and that it is not within the power of the governor of said
74 State to control the officers of its co-defendant, said Sanitary District of Chicago, in the performance of their duties as such officers.

And this defendant, The State of Illinois, admits that under said laws of the State of Illinois, it was the duty of the trustees of the Sanitary District of Chicago to notify the governor of the said State of Illinois of the completion of the said canal or channel, and that it was the duty of the governor of the State of Illinois to appoint three commissioners to examine said canal or channel, as alleged in complainant's bill of complaint. And this defendant alleges that prior to the time when the complainant in this case presented its motion in this honorable court, for leave to file its bill of complaint herein, that the governor of said State had appointed said commissioners as required by the laws of said State, and the said commissioners had reported to him that they had examined said canal or channel, and had found it in all respects completed in conformity with law, and that the governor of said State, prior to said time, issued a permit to the trustees of the said Sanitary District of Chicago, to turn the water and sewage of said drainage district into the Des Plaines and Illinois rivers; and that said trustees did, prior to the time aforesaid, turn said water and sewage into said rivers, as this defendant is informed and believes, as will more fully appear to this honorable court, by reference to the separate answer of the said Sanitary District of Chicago, filed herein; and as to all said allegations in the said separate answer of the Sanitary District of Chicago, filed herein, in reference to the appointment of said commissioners, their report to the governor, and the action of the governor of said State of Illinois in the premises, this defendant avers that the allegations in the answer of its co-defendant are true; and that 75 the said acts of the governor of the State of Illinois were all done and performed prior to the 17th day of January, 1900, when the complainant herein moved this honorable court for permission to file said bill of complaint.

Therefore this defendant avers that the State of Illinois cannot now be enjoined or restrained from issuing to its co-defendant herein, permission or authority to do and perform the acts aforesaid, or to allow them to be done.

This defendant, The State of Illinois, further admits as alleged in said bill of complaint, that by the general provisions of the act of the State of Illinois, creating the Sanitary District of Chicago, the said canal or channel to be constructed by said sanitary district is at all times subject to the control and supervision of the State of Illinois and of her authorities. But this department avers that said control and supervision can only be exercised by and through the law-making power of the said State of Illinois; and that the only authorities of said State, authorized by said laws to control and supervise said canal or channel are the board of trustees of the Sanitary District of Chicago, their officers, agents and employees.

And this defendant, The State of Illinois, denies all unlawful combination in said bill charged without that any other matter or thing material for it to make answer to, and not herein sufficiently answered, avoided, or denied, is true, to the knowledge or belief of this defendant. All of which matters and things this defendant is ready to aver and prove, as this honorable court shall direct, and it prays to be hence dismissed with its reasonable costs and charges in this behalf most wrongfully sustained.

THE STATE OF ILLINOIS,
By EDWARD C. AKIN,
Attorney-General of the State of Illinois.

76 UNITED STATES OF AMERICA:

In the Supreme Court of the United States.

On this 7th day of March, 1900, before me, James T. Jones, clerk of the circuit court of the United States for the southern district of Illinois, personally appeared John R. Tanner, governor of The State of Illinois, one of the defendants in the foregoing bill of complaint above named, (who) being by me duly sworn, deposes and says, that he is the governor of the said State of Illinois, and familiar with its affairs and business; that he has read the foregoing separate answer of this defendant, The State of Illinois, and also the separate answer of its co-defendant, The Sanitary District of Chicago, and that he knows the contents thereof, and the same are true of his own knowledge, except as to the matters stated on information and belief, and as to those matters he verily believes them to be true.

JOHN R. TANNER,
Governor of the State of Illinois.

Subscribed and sworn to before me by John R. Tanner this 7th March, 1900.

[L. S.] JAMES T. JONES,
Clerk Circuit Court U. S., South. Dist. Ills.

(Endorsed:) Supreme Court U. S., October term, 1900. No. 5, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Separate answer of the State of Illinois. Filed January 28, 1901.

77 And on the same day, to wit, on the 28th day of January, A. D. 1901, the answer of the defendant, The Sanitary District of Chicago, was filed in the words and figures following, viz:

78 In the Supreme Court of the United States, October Term, 1900.

STATE OF MISSOURI, Complainant,
v.
STATE OF ILLINOIS and THE SANITARY DISTRICT of Chicago, Defendants.
} Number 5, Original.

Separate Answer of the Sanitary District of Chicago to the Bill of Complaint of the State of Missouri.

Now comes The Sanitary District of Chicago, one of the defendants in the above-entitled cause, not waiving the demurrer to the said bill of complaint heretofore filed in this cause, but wholly relying thereon, for answer to so much of said bill of complaint as it is advised is material and necessary for this defendant to answer unto, does say:

That it admits that the complainant herewith is one of the States of the United States, and that The State of Illinois, one of the defendants herein, is one of the States of the United States, and that 79 this defendant, The Sanitary District of Chicago, is a public corporation, organized under the laws of the State of Illinois and located as in said bill described, and is a citizen of said State. This defendant further admits that the population of the State of Missouri is upwards of three millions of people, and that said State lies on the west bank of the Mississippi river, a public, navigable, and running stream, having a frontage on said stream of over four hundred miles; that by act of Congress providing for the admission of Illinois and Missouri as States of the Union, it was declared that the western boundary of Illinois and the eastern boundary of Missouri should be the middle of the main channel of the Missisippi river; that the shores of the Mississippi river, where its waters form the Missouri and Illinois boundaries, and the soil under the waters thereof, were not granted by the Constitution of the United States, but were reserved to the States of Illinois and Missouri respectively.

This defendant further admits that the States of Missouri and Illinois, each have concurrent general jurisdiction over the waters of the Mississippi river, forming the boundary between them, and each of said States has exclusive territorial jurisdiction over that portion adjacent to its own shore; and that the Illinois river empties into the Mississippi river at a point above the city of St. Louis, on the Illinois side of said Mississippi river.

This defendant further admits that within the territory of the State of Missouri and on the banks of said Mississippi river, and below the mouth of the Illinois river are many cities and towns in the State of Missouri, and many thousands of persons who rely upon the waters of said Mississippi river, in their regular, natural, and accustomed
flow, for their daily necessary supply of water, for drinking
80 and all other domestic, agricultural, and manufacturing pur-
poses, and for watering stock and animals of all kinds, and that said Mississippi river has been flowing in its regular course, and has been used for the purposes aforesaid by the inhabitants of said State of Missouri for a time whereof the memory of man runneth not to the contrary. But whether the river and its waters, and the use thereof, for drinking, agricultural, and manufacturing purposes, in their accustomed and natural flow, are indispensable to the life, health, and business of many thousands of inhabitants of the said State of Missouri, and whether said inhabitants are compelled to use said waters for said purposes, this defendant neither admits nor denies, but leaves said complainant to make proof thereof; but said defendant denies that said river and its waters, and the use thereof, for drinking, agricultural, and mechanical purposes are of value to the State of Missouri as a State or as a body politic.

This defendant further admits that the cities and towns below the mouth of the said Illinois river, within the territory of the said State of Missouri, do by means of waterworks, water-towers, and intakes, built and constructed for that purpose, supply the inhabitants of said cities and towns with an adequate supply of water for drinking and other domestic uses, from the said Mississippi river; but whether said cities and towns are compelled to use the water for drinking and other domestic purposes, or whether said cities and towns are furnished with an adequate supply of pure and wholesome water, fit and healthful for drinking, and other domestic purposes and uses, from said Mississippi river, this defendant neither admits nor denies, but leaves complainant to make proof thereof.

Further, this defendant neither admits nor denies that
81 said waterworks systems are constructed with reference to
said Mississippi river, for the purpose of taking water therefrom, and not from any other source, and leaves complainant to make proof thereof.

This defendant admits that heretofore, to wit: in 1889, the State of Illinois enacted a law known as the sanitary district act, together with an act for the improvement of the Illinois and Des Plaines rivers, and that under said act of said State, the said defendant corporation, known as The Sanitary District of Chicago, was organized and is now existing and operating, and that by the express terms of said act, any canal or drainage corporation organized in accordance with its provisions may have conditions, restrictions, or additional requirements placed on said corporation, or the act, authorizing the creation of said corporation may be amended or repealed, and that by the express provisions of said act, before any water or sewage shall be admitted into any channel constructed under said act, the trustees of said channel should notify the governor of the State of Illinois of the completion of said channel, and that the governor of the State of Illinois should appoint three commissioners to examine said channel or canal and report to the governor of said State of Illinois, whether the same complied with the said act of the State of Illinois; and that if it does, the governor should authorize the water and sewage to be turned into said canal or channel; and without the said permit said water and sewage cannot be so turned in; and by the general provisions of said act, said channel is at all times subject to the control and supervision of the State of Illinois and her authorities; but this defendant avers that such control and supervision can only be exercised by the law-making power of said State.

82 This defendant further admits that the Chicago river is situate in the basin of Lake Michigan, and has forks or branches flowing through the city of Chicago and into Lake Michigan, and that the natural drainage of Chicago is or has been into Lake Michigan, but this defendant denies that the drainage and sewage of the territory embraced in this defendant's district, namely, the Sanitary District of Chicago, is led or flows into the Chicago river and Lake Michigan; but this defendant avers and will establish the fact by sufficient proof to the satisfaction of this honorable court, if permitted to do so, that the greater portion of the water and sewage of said territory has been, for many years discharged into the Des Plaines and Illinois rivers, in the manner which will be pointed out and particularly described hereinafter in its answer.

This defendant, further answering admits, as will be hereinafter more fully shown, that it has constructed a drainage canal, having origin and extent described in said bill; that in the construction of said canal or drain, this defendant cut through the natural ridge or water-shed, which divides the basin of Lake Michigan from the basin of the Des Plaines and Illinois rivers, and of the Mississippi river. The origin, extent, and public history of said drainage channel will hereafter be more fully recited in this answer.

But this defendant denies that all or any considerable portion of the sewage and drainage of the territory embraced in its said district is led into or flows into the Chicago river and Lake Michigan, and to this allegation this defendant will make fuller answer as hereinbefore stated.

This defendant expressly denies that its acts and doings in complainant's bill mentioned, and hereinafter described, have been without legal authority, but on the contrary says that each and every of its acts have been in strict pursuance of authority given it by the State of Illinois.

83 This defendant further admits, not alone that it has about completed the said drainage channel, but states that it has completed the same, and that it is about to receive and has received into said channel the sewage matter and filth of the Sanitary District of Chicago, which embraces nearly the entire city of Chicago, and a portion of the county of Cook, and that it is about to cause and has caused said sewage and filth to flow through said channel or drain towards and into the Des Plaines river; but that the said sewage and filth will be carried into said Mississippi river, and that it will pass by the homes of the inhabitants of the State of Missouri, or of the cities and towns and their waterworks, within said State, this defendant denies.

This defendant admits that the sewage matter and filth which it is now receiving and causing to flow through said drainage channel into said Des Plaines river, is that which is created by the population and activities and industries of the district of this defendant; that among those industries are stockyards, slaughtering establishments, and rendering establishments, but not distilleries; and this defendant denies that noxious matters created by said establishments will be received into said channel, but on the contrary thereof, this defendant alleges that the said noxious matters are in large part, if not wholly, rendered innocuous before being received into the sewage system of the city of Chicago and of said drainage district, and this defendant denies that there are any distilleries within the said district. This defendant further denies that it is true, as stated in said bill of complaint, that the city of Chicago has been discharging its sewage matter and filth into said Chicago river and into Lake Michigan, in such large quantities, that much of it has accumulated upon the bed and along the sides of said river, and upon
84 the bed of said lake, near the shores thereof; and it especially denies that the plan adopted and in operation by this defendant will loosen said matter and filth so alleged, to be deposited upon the bed of the lake and the sides of the river, and the shores of said river and lake and cause it to flow into and towards said Des Plaines river; but on the contrary thereof, defendant says, as it is more particularly hereinafter set forth, that for many years a large portion of the sewage matter arising in said drainage district has been turned into the Chicago river, and has been pumped into a drainage channel heretofore constructed, and has flowed into the Des Plaines river. This defendant especially denies that the plan of operation adopted by it will loosen any accumulated matter or filth, but on the contrary thereof, it says, that it denies the presence of said accumulated matter and filth, at the points and to the extent in said bill alleged, and states that during a long time preceding the opening of defendant's channel, such of the sewage and filth of said district as has been discharged into the Chicago river and

flowed thence into Lake Michigan, had been taken up and dissipated by the cross-currents of Lake Michigan, and carried to distant points, and has wholly lost its noxious character, and that much of said matter as might from time to time have accumulated in the past has been covered upon the bottom of said lake by the deposits thereon of earth excavated from the foundations of the city, and deposited in said lake for the making of new lands.

This defendant denies that if it shall carry its plans into execution, and shall carry all the sewage and alleged noxious matters arising in said Sanitary District into the waters of the Des Plaines river, through said drainage channel, that the waters of the Mississippi river will of a certainty or at all be poisoned and polluted
85 thereby, as alleged in said bill of complaint, and it expressly denies that the carrying out of its plans will destroy the flow and adaptability of the waters of the Mississippi river, along the territory of complainant, for domestic or other uses. And it expressly denies that such use will render wholly valueless and entirely worthless the said waterworks systems of the cities and towns located in State of complainant; or that it will injure and destroy the business of the cities and towns in State of complainant, in furnishing and selling water to private consumers, or that it will disable them from furnishing water for domestic or any other purposes. And this defendant expressly denies that it will injure the property and business of said cities and towns, or that it will establish and create as to them a direct and continuing nuisance, with the results in said bill described, or any injurious results; and it expressly denies that any damage will result to said complainant or to said cities and towns, or inhabitants of complainant, from such use and carrying out of the plans of this defendant.

This defendant neither admits nor denies, as alleged by complainant in its bill of complaint, that the filth and sewage of the Sanitary District of Chicago, which will be turned into the Des Plaines river, will amount to 1,500 tons daily, but leaves the complainant to make proof thereof; but this defendant denies that said filth and sewage, or any part thereof, will be deposited in the bed or soil of the Mississippi river, within the jurisdiction of complainant; and this defendant denies that the filth and sewage of the said Sanitary District of Chicago will pollute and poison the waters of the said Mississippi river to such an extent as to render said waters unwholesome, unfit, and unhealthful for drinking and other domestic uses, by the inhabitants in the territory of complainant,
86 or unfit for watering stock and for manufacturing purposes, and this defendant denies that said sewage from the Sanitary District of Chicago will poison and pollute the waters of the said Mississippi river along the territory of complainant with germs of diseases of various kinds, or with any germs of disease whatever; and this defendant denies, as alleged in said bill of complaint, that this defendant will cause a continuing nuisance in the Mississippi river, to the detriment, and irreparable and continuing damage and

injury of the said State of Missouri, or an irreparable injury to the lives and health of the citizens or inhabitants of the said State of Missouri; but on the contrary, this defendant expressly avers, and if permitted, will prove to this honorable court, that the turning into the Des Plaines river of the sewage of the Sanitary District of Chicago, together with 300,000 cubic feet per minute of the pure water of Lake Michigan, which will accompany the same, will greatly improve the quality of the waters of the Illinois and Mississippi rivers, and also greatly improve the conditions which existed prior to the time said sewage and water were turned into said Des Plaines and Illinois rivers, as will more fully appear hereafter in this answer.

And for other and further answer in this behalf, this defendant says that the Sanitary District of Chicago is a corporation organized and existing under the laws of the State of Illinois; that it is wholly within the county of Cook, in said State; with power to extend its operations and works beyond the territorial limits of its existence, as will be more particularly hereinafter shown.

This defendant alleges that in the year 1822 the proper authorities of the United States enacted a law granting to the State of Illinois the right for a route for a canal connecting the Illinois river with the southern bend of Lake Michigan; that on the 2d day of 87 March, 1827, a further act of Congress of the United States was approved, and by which a quantity of land equal to five sections in width on each side of the canal proposed by said act, was granted to the State of Illinois to aid in the construction of said canal. That subsequently thereto the State of Illinois entered upon the construction of said canal according to various acts of the legislature, and prosecuted the work of completing said canal, so that it was long since opened from Bridgeport to La Salle upon the Illinois river. That there were in the course of the construction of said canal divers levels provided, one of which was known as Summit level, properly connected with the remaining course of said canal. That a large quantity of the water necessary to supply the said Summit level of said completed canal was obtained by means of a pump or pumps at or near Bridgeport in Cook county, Illinois, by which the waters of the Chicago river were pumped and discharged into the said Summit level of said canal. That said pumping was begun in the year 1848 and continued until the year 1871. That said pumps were operated by and at the expense of the State of Illinois, in order to supply said canal with water. But during said period, viz., from 1865 to 1871, the city of Chicago assisted in bearing the expenses of such work, and used the said Chicago river and said canal for the discharge of its sewage, and the said arrangement continued until the year 1871. That in 1865 the legislature of Illinois by law authorized the city of Chicago to deepen the said Illinois and Michigan canal, and thereby effect a flow by gravity from the Chicago river into said Summit level. Reference is hereby made to said public law of 1865, and the same will be exhibited to this court upon the hearing of this cause, and the same

is hereby made a part of this answer and is marked "Exhibit A." And this defendant avers and shows the
88 court that in and by said law of 1865, the city of Chicago was authorized to deepen and did promptly thereafter deepen the said Illinois and Michigan canal for the express purpose of disposing of the sewage received into the said Chicago river, and did thereafter use said canal for said purpose. That the said Chicago river itself has in ordinary times no current that is perceptible, but maintains a level with the water of Lake Michigan, and is rather an estuary of said lake than a river, except in case of flood, when it has a sluggish current settling, not by descent, but by propulsion into the lake. That since a time prior to 1865, and since the year 1849, since when a large share of the drainage of the city of Chicago has been into said Chicago river, and that from that time until now, by means of said pumps at Bridgeport, and the said deep cut made in pursuance of said act of 1865, the discharge of nearly all of the sewage of the Chicago river has been into said canal and through and down said canal to the Des Plaines river at Lockport.

And this defendant further answering, says, that the population of the city of Chicago in the year 1890, as determined by the Federal census, was about 1,100,000. That from that time until the filing of the bill of complaint in this case, there has been an increase of 400,000. That of the 1,500,000 people thus embraced within the limits of the city of Chicago, the sewage of 200,000 of them has been discharged at other points than into the Chicago river, and that the sewage of the residue of the population of said city has at all times been discharged into the Chicago river, and that the whole of the sewage of said residue of said people has been carried by the said pumps into the said deep cut during the whole period aforesaid into the said canal and into the said river, save and
89 except upon such occasions of flood or unusual instances, few in number, when the current of the river was set into the lake, causing the lake to be roily and polluted near the mouth of said river, and along the shores of Lake Michigan, until the subsidence of said flood.

This defendant, further answering, says, that such has been, in the period aforesaid, the increase of population and extent of sewage discharged into the Chicago river, that in 1881 it was found necessary to aid the gravity flow of water from the Chicago river into the deep cut by the establishment of larger pumps at Bridgeport, which is a point within the limits of said Sanitary District, in the said county of Cook, and that since said year 1881, a period of nineteen years, the said deep cut and the said pumps have been continuously working, carrying away the said sewage into the said deep cut, and through said canal into the Des Plaines river. And this defendant alleges that the work of deepening said canal by the deep cut, as it is popularly called, was so extensive that the city of Chicago expended thereon the sum of about three million dollars, viz:

$2,955,340; and also a very great sum of money in the erection and operation of the pumps at Bridgeport, as aforesaid, and that all of this work was open and notorious, and in the sight of all men.

And defendant, further answering, says, that in the year 1889 the legislature of the State of Illinois passed an act entitled, "An act to create sanitary districts, and to remove obstructions in the Des Plaines and Illinois rivers," which was duly approved on the 29th day of May, and went into force and effect on the 1st day of July thereafter. That immediately thereafter such proceedings were had that a Sanitary District was formed under the provisions of
90 said act, which is the district of this defendant in this cause. That said district, duly officered, has been in existence since January of the year 1890. Special reference is made to said act, a copy of which is attached to this answer for greater accuracy, and made a part hereof, and marked " Exhibit B."

And this defendant, further answering, says, that in pursuance of said act it immediately entered on the discharge of the duties imposed upon it by said act. That it adopted a general plan of construction for the channel, to be of the size, dimensions, and general character mentioned in said act, of 600,000 cubic feet of water per minute. That said channel originates at Robey street in the city of Chicago, and passes thence through the counties of Cook, Will and Du Page, by the best determinable lines to Lockport on the Des Plaines river. That in and about preparing for the construction of said channel, this defendant, in the most open and notorious manner acquired by deed, where possible, the right of way for its various structures, placing the said deeds for said premises upon record in the recorders' offices, of Cook, Will and Du Page counties, as obtained, beginning in the year 1891. That where necessary it instituted condemnation proceedings in the proper courts, of Du Page, Will and Cook counties. That all of these, its said acts were open and notorious, and this defendant expressly avers that by the act incorporating it, all of its acts and doings are matters of public record, whereof people and courts are required to take notice, and that its records are and at all times have been open to the inspection of all citizens, and of all persons interested therein. That there are a number of lines of railway passing between the cities of Chicago and St. Louis, one of the cities in the State of complainant, near to and within plain sight of the work progressing from
91 time to time upon said channel, traversed by hundreds of thousands of citizens day and night. That such has been the extent and character of the work performed by this defendant within the time stated, that it became a matter of notoriety to all persons traversing said roads, and that such was the magnitude of the undertaking, the difficulties experienced and overcome, the greatness and scope of the work, that it became noted to all the world, and the subject of innumerable dispatches, communications and publications made from time to time in all cities of the United States. That in the prosecution of this work it has occupied more

than four thousand acres of land in the county of Cook alone, more than five hundred acres of land in the county of Du Page, and nearly three thousand acres in the county of Will, at a total cost of more than three million dollars. That during the whole of the nine years since the institution of work upon this enterprise, as aforesaid, this defendant, The Sanitary District of Chicago, has expended upon said work more than thirty-three million dollars. That these expenditures have all been openly, notoriously and of record made in and about the public interest.

And this defendant, further answering, says, as it has heretofore said, that it had completed its said channel, prior to the filing of the bill of complaint in the said cause. That that which physically prevented the opening of the said channel, was but the interposition of a few cubic yards of earth left to protect the work and workmen from the inflow of the Chicago river. That these were removed on the 2d day of January, 1900; and the water turned from the Chicago river into said channel and down to the controlling works at Lockport, filling the said drainage channel for a distance of twenty-eight miles, to an average depth of twenty-two feet, with prisms of
water varying from 110 feet in width at the bottom to 200
92 feet in width at the bottom, and the width at the water line
varying from 160 feet to 290 feet. That this vast body of water moved from the Chicago river and Lake Michigan into this channel between the 2d day of January and the 16th day of January, 1900; and that all that remained to do, in order to complete the great work for which the aforesaid great expenditures have been made was the raising of the gates and the lowering of the bear-trap dam at the bottom of said prism, twenty-eight miles away from the source of supply, and that this was duly and lawfully accomplished at 11.16 o'clock a. m., on the 17th day of January, 1900, prior to the time when complainant presented its motion to this court for leave to file its bill of complaint herein, and five days prior to the time said bill was filed by leave of this court.

Wherefore, and by reason of the premises aforesaid, this defendant alleges that the said State of Missouri, complainant herein, had notice of the premises, and of the great work and the great expenditures, which this defendant alleges were the expenditures of public money raised by taxation, and by the sale of bonds, which are liens upon the tax funds of said district to be hereafter levied; and having such notice as aforesaid, and having so waited as aforesaid, it has been guilty of laches, and has slept upon its rights, if any it ever had, and is estopped to further urge its cause.

And this defendant, further answering, says, that the drainage channel hereinbefore mentioned was commenced September 3, 1892, that it is constructed through glacial drift, earth and rock, through glacial drift for a distance of 13.1 miles, and through solid rock for a distance of 14.95 miles. That the width of said channel where
the same is constructed through glacial drift for 7.8 miles is
93 110 feet at the bottom and 193 feet at the water line, and has
a capacity of 360,000 cubic feet of water per minute, with a

velocity of one and one-quarter miles per hour. That for a distance of 5.3 miles said channel has a width at the bottom of 202 feet, and of 290 feet at the water line, and a capacity of 600,000 cubic feet per minute, with a velocity of one and one-quarter miles per hour. That where said channel is cut through solid rock, it has an average width from top to bottom of 161 feet, with a capacity of 600,000 cubic feet per minute, and a velocity of 1.9 miles an hour. That the carrying capacity of the total channel at the rate of three miles per hour exceeds 360,000 cubic feet per minute, and that this capacity of channel will be sufficient to and will furnish pure water from Lake Michigan at the ratio of twenty cubic feet to one cubic foot of the liquid sewage of every description furnished or to be furnished from the Chicago river and the sanitary district aforesaid. That by the terms of the organic act creating the said Sanitary District of Chicago, defendant was fully empowered and enjoined to do and perform all the acts, and make and construct all the improvements, channels, and outlets that it has constructed, at a cost to the Sanitary District of Chicago of over thirty-three million dollars.

And this defendant, as to so much of said bill as alleges that it, "without any legal authority so to do, has already in part effected its said threat and purpose, and threatens to permit and to cause said sewage and filth, by artificial means of pumping and otherwise, to flow through the said channel or drain towards and into the said Des Plaines river, and eventually into the Mississippi river," answering, says: That all of its acts and doings hereinbefore and in said bill set forth, have been done in pursuance of the powers given in and the duties devolved upon it by the said act of
94 May 29, 1889. That after having prosecuted its said work from the beginning continuously as aforesaid until the 27th day of May, 1897, a certain joint resolution was adopted by the legislature of the State of Illinois which, among other things, recited as follows:

"Whereas, the General Assembly in 1889 passed an act to create sanitary districts, and provided thereunder for the disposal of the sewage of the city of Chicago, through the Des Plaines and Illinois rivers, by means of a canal across the Chicago divide, of such capacity as to dilute the sewage beyond offense, and such sewage disposal was granted on the condition that said channel should be so constructed as to form part of a navigable waterway between Lake Michigan and the Mississippi river. * * *

"And whereas, under the legislation aforesaid and acts supplemental thereto, the works of the Sanitary District of Chicago are so far advanced that the water will be turned through the same in the year 1899.

"Therefore, be it resolved, first; That it is the policy of the State of Illinois to procure the construction of a waterway of the greatest practicable depth and usefulness for navigation from Lake Michigan, by way of the Des Plaines and Illinois rivers to the lower Mississippi river, &c., &c." Which said joint resolution is to be found in the

Session Laws of the State of Illinois for the Year 1897, on page 309. By which said joint resolution the extent and progress of the said work of this defendant was recognized and publicly declared. A copy of said joint resolution is attached to this answer as a part thereof, and marked, "Exhibit C."

That in the original act under which this defendant was incorporated, and by section 27 thereof, it was provided: "If any
95 channel shall be constructed under the provisions of section
23, of this act, it shall be the duty of the trustees of such district, when such channel shall be completed, and before any water or sewage shall be admitted therein, to duly notify in writing the governor of this State of such fact, and that the governor shall thereupon appoint three discreet persons as commissioners, one of whom shall be a resident of the city of Joliet, or between said city and the city of La Salle, and one a resident of the city of La Salle, or between said city and the city of Peoria, and one a resident of the city of Peoria, or between said city and the mouth of the Illinois river, to inspect said work. The said commissioners shall, within ten days after such appointment, meet at the city of Chicago, and shall appoint a competent civil engineer, and they may employ such other assistants as they may require to expeditiously perform their duties. * * * And in case they shall find the work in all respects in accordance with the provisions of section 28, of this act, they shall so certify to the governor, who shall thereupon authorize the water and sewage to be let into said canal."

That in pursuance of said section the governor of the State of Illinois, the Honorable John R. Tanner, upon notice in writing of the substantial completion of said work by said trustees, did appoint such a commission as is provided for in said section 27. That in all respects as to personnel and locality said section was complied with by the appointment of E. S. Taylor, John Lambert and Alfred Schoch. That after such appointment the said commission went upon and examined the said channel and the said work, and thereupon, and on the 16th day of January, 1900, reported to the governor as follows:

96 "Governor John R. Tanner:

Your special committee reports the work of the sanitary trustees on the drainage channel substantially completed, and meets the requirements of the law, with the exception of the removal of the State dams, which are in the hands of the supreme court. We recommend the granting of the official permit. Full official report will follow telegram. William Boldenweck, president, board of trustees is at St. Nicholas hotel, Joliet.

(Signed)

E. S. TAYLOR.
JOHN LAMBERT.
ALFRED SCHOCH."

That thereupon and on the 17th day of January, 1900, the said governor authorized the opening of the said channel by the following message:

SPRINGFIELD, ILLINOIS, January 17, 1900.
VIA JOLIET, ILLINOIS, January 17, 1900.

To William Boldenweck, Lockport, Illinois.
To the board of sanitary trustees, Chicago Drainage District, Chicago, Illinois.

GENTLEMEN: The board of commissioners heretofore appointed by the undersigned to make an examination and survey of the Chicago river and the chicago drainage Channel, to determine whether the said channel has been completed in accordance with the requirements of sec. 23, of the act entitled, "An act to create sanitary districts, and to remove obstructions in the Des Plaines and Illinois rivers, approved May 29, 1889, in force July 1, 1889, having certified to me that said channel has been and is now completed in accordance with the law creating said sanitary district. Now, therefore, I, John R. Tanner, governor of the State of Illinois, do hereby authorize and direct you, the said board of sanitary trustees, to open and let into the said channel the waters of Lake Michigan and of the Chicago river, and the sewage of the said sanitary district, and to use and employ said channel for all the uses and purposes
97 for which said channel was constructed.

In witness whereof I have hereunto set my hand and seal, this 17th day of January, A. D. 1900.

JOHN R. TANNER, Governor.

That thereupon the said trustees, having received the said message and permit and authorization, did open the controlling works, and did permit the flow of the water of Lake Michigan and the sewage of the Sanitary District of Chicago as aforesaid into the Des Plaines river.

Wherefore, this defendant says that in all respects it hath proceeded with full legal authority so to do.

And this defendant, further answering, says that the distance by way of the drainage channel and the Illinois river, from Robey street, Chicago, in the said sanitary district, to the mouth of said Illinois river, is 322 miles. That the said Illinois river, into which the said Des Plaines river empties, is formed by the junction of the Des Plaines and the Kankakee rivers, that the Fox river empties into the Illinois river at Ottawa, and that these three rivers uniting to form the Illinois river with their tributaries, are the natural drainage system for an area of country thickly populated and occupied by not less than a million and a half of people outside of said sanitary district, and embracing an area of twenty-five thousand square miles. That upon the banks of said rivers, among very many smaller cities, all of them draining into the said rivers, and from thence into the Mississippi river, are the principal cities of

Joliet, with a population of over 40,000, and having immense manufacturing establishments of the same nature and character as those in this defendant's district, being the establishments of a varied industry carried on by a working population; and
98 the city of Aurora, with a population of 40,000, and a drainage and sewage system in all respects like that of Joliet. That these cities are respectively forty miles nearer to St. Louis by running water than is the drainage district of your defendant. That lower down upon said Illinois river is the city of Peoria, with a population of 60,000, wherein is conducted the greatest distilling industry in the United States, together with stock-yards and cattle pens, as well as other large industries, all of which have their discharge into the said Illinois river. That the distance from the said Peoria to the mouth of the said Illinois river is about 160 miles. That in addition to the foregoing, may be mentioned the cities of Springfield, with a population of 25,000; Jacksonville, Carrolton, Beardstown, Pekin, Havana, Rushville, Mt. Sterling, Pittsfield, Lewiston and La Salle, all of which empty their sewage into the said Illinois river, by direction or indirection; and that the various sewage of this great population and these great cities is received into the said Illinois river before its junction with the Mississippi river, and that in addition thereto, as hereinbefore stated, the sewage of the Sanitary District from the same extent of territory, as is now discharging its sewage through the Sanitary District channel, has been for the last thirty years received into said Des Plaines river, and from thence into the Illinois river.

And this defendant, further answering, says, that in addition to the sewage and drainage carried into the Illinois river, and from thence into the Mississippi river, is the sewage and drainage of the vast territory tributary to the Mississippi river and its tributary streams. That this territory so drained is substantially all of the land of the United States between its northern border and the central line running east and west of the State of Kansas, prolonged
99 eastward through the State of Missouri, and from the Rocky mountains on the west to a line running from northeast to southwest, through the State of Illinois from the city of Chicago to the city of St. Louis, and in addition thereto, the western half of the State of Wisconsin, and the western two-thirds of the State of Minnesota. That the population of this region so drained into the Mississippi river, is in the neighborhood of fifteen million people. That an uncounted number of cities and towns, with populations ranging from two thousand to two hundred and fifty thousand, are situated upon the banks of the said Mississippi river and its tributaries, and discharge their sewage therein. That chief among these cities and towns may be mentioned Minneapolis and St. Paul in the State of Minnesota; Des Moines, Sioux City, Dubuque, Burlington, Davenport, and Keokuk, in the State of Iowa; Rock Island and Quincy in the State of Illinois; Kansas City in the State of Missouri, whose population is about 200,000, and St. Joseph, Boonville, St. Charles,

and Jefferson City in said State, all of which are populous, and which discharge their sewage into the Missouri river; and Omaha and Nebraska City in the State of Nebraska. That the distance from St. Paul and Minneapolis to the mouth of the Illinois river is 700 miles. That the distance from Omaha to the mouth of the Illinois river is 682.8 miles. That the distance from Kansas City to the mouth of the Illinois river is 413.7 miles. That the distance from Nebraska City to the mouth of the Illinois river is 630.7 miles. That in all these towns are carried on the industries such as are practiced by the citizens of this country, and similar in variety and character to those carried on within the district of this defendant. That especially at Kansas City and Nebraska City and at Omaha, there are vast
100 cattle yards, slaughter houses, rendering establishments and
other industries, such as are particularly mentioned in the bill filed herein as being carried on within the limits of the drainage district.

And this defendant says, that the said Mississippi river and the said Missouri river and their tributaries above the cities and towns in the State of complainant, mentioned in said bill, constitute the natural, uncontrollable drainage system of this whole region, this whole vast population and this whole system of industries, and that said cities and towns use the said system for their sewage from their location downward. That the additional amount of sewage which is being discharged through the drainage channel of this defendant, if it shall not be interfered with by the order of this honorable court, is but trifling in amount as compared with the enormous volume of sewage received into said Mississippi river above the cities and towns in the State of complainant, mentioned in said bill.

And yet so it is, may it please your honors, that by the natural law relating to sewage and drainage, and to running water in large bodies, the said sewage, instead of contributing a harmful element, is deprived of all of its deleterious qualities by processes of vaporization, attrition, lodgment, absorption, chemical conversion and bacteriologic changes, so that in the end the water purifies itself. That in addition to the foregoing, this defendant, in pursuance of the act incorporating it, is removing from its sewage all of the solid material, and is diluting all of the liquid material by an addition thereto of twenty cubic feet of water, drawn from Lake Michigan, to every cubic foot of sewage. Wherefore, this defendant says, that it will not, in and by the operation of its said system, contaminate, pollute, or destroy the water supply from the said Mississippi river and its tributaries, to the inhabitants, cities and towns in the State of
101 complainant, as in and by said bill declared. This defendant
attaches hereto and makes a part of this answer a certain table, which it marks "Exhibit D," of its answer, showing therein the extent and population of some of the cities and towns of the said territory now being drained and sewaged into the said Missis-

sippi river and its tributaries, above the city of St. Louis and their respective distances from St. Louis.

And, further answering, this defendant denies each and every other allegation of said bill of complaint, not herein and hereby admitted, traversed, confessed or denied; and this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any matter, cause or thing in complainant's bill of complaint contained, material or necessary for this defendant to make answer unto, and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true to the knowledge or belief of this defendant, this defendant is ready and willing to aver and maintain and prove as this honorable court shall direct, and prays to be hence dismissed with its reasonable costs in that behalf most wrongfully sustained.

BERNARD A. ECKHART,
Trustee of the Sanitary District of Chicago.
THE SANITARY DISTRICT OF CHICAGO,
By CHARLES C. GILBERT,
SAMUEL M. BURDETT,
Attorneys for the Sanitary District of Chicago.
WILLIAM M. SPRINGER, Of Counsel.

102 UNITED STATES OF AMERICA:

In the Supreme Court of the United States.

On this 13th day of March, 1900, before me, S. W. Burnham, clerk of the circuit court of the United States for the northern district of Illinois, personally appeared B. A. Eckhart, one of the trustees of The Sanitary District of Chicago, one of the defendants in the foregoing bill of complaint of the State of Missouri, against the State of Illinois and the Sanitary District of Chicago, who, being by me duly sworn, deposes and says, that he is a duly elected and qualified trustee of the Sanitary District of Chicago, and that he is familiar with its affairs and business; that he has read the foregoing separate answer of this defendant, The Sanitary District of Chicago, and knows the contents thereof, and that the same are true of his own knowledge, except as to the matters herein stated on information and belief, and as to those matters he verily believes them to be true.

S. W. BURNHAM,
Clerk U. S. Circuit Court, Northern District of Illinois.

(Endorsed:) Supreme Court U. S., October term 1900. No. 5. original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Separate answer of the Sanitary District of Chicago. Filed January 28, 1901.

(Exhibits mentioned in foregoing answer not filed therewith.)

103 And afterwards, to wit, on the 13th day of May, A. D. 1901, a motion for leave to file a supplemental bill was filed in the words and figures following, viz:

104 In the Supreme Court of the United States. In Equity.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
} No. 5, Original.

Motion for Leave to File Supplemental Bill.

To the honorable the Chief Justice of the United States and the associate justices of the Supreme Court of the United States:

The State of Missouri, complainant in the above entitled cause, by Edward C. Crow, its attorney general, and B. Schnurmacher, its counsel, respectfully represents that since the filing of the original bill herein, on the 17th day of January, 1900, the defendants have opened and put in operation the channel referred to and de-
105 scribed in said bill of complaint, the opening and operation of which was sought to be enjoined by this proceeding, and have since said 17th day of January, 1900, been doing the things against which complaint is made in said bill.

That defendants have also, since the filing of said bill, diminished the dilution of the sewage transmitted through said channel from a flow of 20,000 cubic feet per minute for each 100,000 inhabitants of the Sanitary District of Chicago, to not exceeding 10,000 cubic feet per minute for each such number of inhabitants.

To the end that the matters so occurring since the filing of said bill may be made to appear herein, complainant moves and prays the court to permit it to file the accompanying supplemental bill, and to make a rule upon the defendants to plead thereto.

E. C. CROW,
Attorney General of Missouri.

B. SCHNURMACHER, Of Counsel.

(Endorsed:) Supreme Court U. S., October term, 1900. No. 5, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion for leave to file supplemental bill. Filed May 13, 1901.

106 And on the same day, to wit, on the 13th day of May, A. D. 1901, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 5, Original.

On motion of Mr. B. Schnurmacher, of counsel for the complainant, leave is hereby granted to file a supplemental bill of complaint herein, and on motion of Mr. William M. Springer, of counsel for the defendants, leave is hereby granted to file a demurrer to the 107 fourth paragraph of said supplemental bill and an answer to said supplemental bill, and on motion of Mr. B. Schnurmacher, of counsel for the complainant, leave is hereby granted to file a reply to said answer.

108 And on the same day, to wit, the 13th day of May, A. D. 1901, the supplemental bill of complaint was filed in the words and figures following, viz:

109 Supreme Court of the United States, October Term, 1900.
In Equity.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
No. 5, Original.

Supplemental Bill.

E. C. Crow, attorney general of Missouri.
B. Schnurmacher, of counsel.

110 In the Supreme Court of the United States. In Equity.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
Supplemental Bill.

To the honorable the Chief Justice of the United States and the associate justices of the Supreme Court of the United States:

Your orator respectfully complains and says that heretofore, to-wit, on the 17th day of January, 1900, your orator filed in this honorable court, at the present term thereof, its original bill of complaint against the State of Illinois and the Sanitary District of Chicago, in which bill of complaint your orator did show and make it appear that the defendants, having constructed an artificial channel or open drain from the West fork of the South branch of the 111 Chicago river in the city of Chicago and county of Cook, in the State of Illinois, to a point near Lockport, in the county of Cook in said State, where said channel or drain connects with and empties into the Desplaines river, which empties into the Illinois river, and which latter flows and empties into the Mississippi river at a point distant about 43 miles above the city of St. Louis, in the State of Missouri, did on said 17th day of January, 1900, threaten and propose to receive into said channel or drain the sewage matter and filth of said Sanitary District of Chicago, and did threaten and propose to permit and to cause the said sewage and filth to flow through said channel towards and into the Desplaines river and eventually into the Mississippi river, and thereby, as is charged in said original bill of complaint, to pollute the water of said Mississippi river to the injury of the complainant and its inhabitants, destroying said water for primary uses, and rendering it unfit for drinking and for domestic purposes; and your orator did thereupon pray that defendants, and each of them, and their officers, agents, employés and servants, might be enjoined from permitting or causing any of said sewage to be so discharged into said channel or drain, and from permitting or causing the same thence to flow into said Desplaines river, and that defendant, The State of Illinois, might be enjoined from issuing to defendant, The Sanitary District of Chicago, permission or authority to do and perform said acts, or to allow the same to be done or performed.

Complainant further states and shows that thereupon a subpœna was issued out of this court, directed to the said defendants, and they were duly served with said process to appear, and that defendants, and each of them, did accordingly appear and put in their demurrers to said original bill of complaint, which demurrers having 112 been duly argued and heard by the court, were, on the 28th day of January, 1901, by the court overruled. Thereupon said defendants did file their answers to said bill of complaint.

And your orator further complains and shows that notwithstanding the filing of said original bill of complaint herein, on the 17th day of January, 1900, the defendants on said day did proceed to open the said channel or ditch, and did permit and cause the sewage, filth and other noxious matters of the Sanitary District of Chicago to flow therein, and thence into the Desplaines river, all as it is charged in the bill of complaint, defendants proposed and intended to do, and that they have ever since said 17th day of January, 1900, permitted and caused the said sewage, filth and noxious matters to flow into and through said channel and thence into said Desplaines river, and that that which your orator did in its bill complain and charge would result, has in point of fact resulted and ensued, in this, that the said sewage, filth and noxious matters thus transmitted into said channel, and permitted and caused to flow through the same and into said Desplaines river, have polluted the water of the Mississippi river along the borders of your orator, and have destroyed the value of the same for primary purposes and uses, and for drinking and domestic purposes, and have caused and are causing much sickness to persons living along the banks of said river in the State of your orator, and will continue to do so unless said acts of the defendants are restrained and enjoined by this court in conformity with the prayer of the original bill.

And your orator further shows and represents that whereas under the act of the General Assembly of the State of Illinois authorizing the construction and operation of said channel, it was required 113 that said sewage and filth be diluted with not less than 20,000 cubic feet of water per minute for each 100,000 inhabitants of said sanitary district, the defendant, The Sanitary District of Chicago, has not at any time since the opening and operation of said channel furnished such an amount of water dilution; and that since the 20th day of April, 1901, said defendant, acting under orders of the Secretary of War, has reduced such dilution to not exceeding 200,000 cubic feet of water per minute in the aggregate, or about 10,000 cubic feet for each 100,000 inhabitants of its district, and proposes hereafter to limit the maximum dilution to that amount.

To the end, therefore, that the matters and things aforesaid, so occurring since the filing of the original bill, may be considered by this court, and that your orator may have the benefit thereof herein, your orator prays that the defendants, and each of them, may by rule of this honorable court be required to answer or otherwise plead to this supplemental bill, and for such other and further relief in the premises as may be meet and proper.

E. C. CROW,
Attorney General of Missouri.

B. SCHNURMACHER, Of Counsel.

(Endorsed:) Supreme Court U. S., October term, 1900. No. 5, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Supplemental bill. Filed May 13, 1901.

114 And on the same day, to-wit, on the 13th day of May, A. D. 1901, an order for appearance for defendants was filed in the words and figures following, viz:

Order for Appearance.

Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
No. 5, Original.

The clerk will enter our appearance as counsel for the defendants.

JOHN G. DRENNAN,
Chicago, Ills.
H. J. HAMLIN,
Att'y Gen'l, Springfield, Ill.

☞ NOTE.—Must be signed by a member of the bar of the Supreme Court United States. Individual and not firm names must be signed.

[Endorsed:] Supreme Court U. S., October term, 1900. Term No. 5, orig'l. Appearance for def'ts. Filed May 13, 1901.

115 And on the same day, to wit, on the 13th day of May, A. D. 1901, a demurrer to the fourth paragraph of the supplemental bill of complaint was filed in the words and figures following, viz:

116 In the Supreme Court of the United States, October Term, 1900. In Equity.

THE STATE OF MISSOURI, Complainant, *v.* THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.	No. 5, Original.

The Joint Demurrer of the Defendants to so Much of the Supplemental Bill of Complaint as is Embraced in the Fourth Paragraph Thereof.

Now come the State of Illinois, by Howland J. Hamlin, its attorney general, and the Sanitary District of Chicago, by James Todd and P. C. Haley, its attorneys, and, as to so much of the said supplemental bill of complaint as is set forth in the fourth paragraph of said supplemental bill, in the words and figures as follows:

"And your orator further shows, and represents that whereas under the act of the General Assembly of the State of Illinois 117 authorizing the construction and operation of said channel, it was required that said sewage and filth be diluted with not less than 20,000 cubic feet of water per minute for each 100,000 inhabitants of said sanitary district, the defendant, The Sanitary District of Chicago, has not at any time since the opening and operation of said channel furnished such an amount of water dilution; and that since the 20th day of April, 1901, said defendant, acting under orders of the Secretary of War, has reduced such dilution to not exceeding 200,000 cubic feet of water per minute in the aggregate, or about 10,000 cubic feet for each 100,000 inhabitants of its district, and proposes hereafter to limit the maximum dilution to that amount."

Which said paragraph seeks that these defendants may answer and set forth whether the defendant, The Sanitary District of Chicago, since the opening and operation of said channel, has furnished an amount of water dilution equal to 20,000 cubic feet per minute for each 100,000 inhabitants of said sanitary district; and whether since the said 20th day of April, 1901, the said sanitary district, acting under orders of the Secretary of War, has reduced such dilution to not exceeding 200,000 cubic feet per minute, or to about 10,000 cubic feet for each 100,000 inhabitants in said sanitary district, and whether the said defendant, The Sanitary District of Chicago, proposes hereafter to limit the maximum dilution to that amount,—

Said defendants doth demur and for cause of demurrer saith that, whether the said Sanitary District of Chicago has or has not complied with the law of the State of Illinois in reference to the amount of water which should be required to flow through the channel of said canal, is a matter which does not concern said complainant; that it, the said Sanitary District of Chicago, is alone accountable to the said State of Illinois for any alleged failure on its part 117½ to comply with the provisions of its organic act; that the alleged ultimate object sought by the original bill of complaint and the supplemental bill of complaint filed in this cause, is the prevention of the pollution of the Mississippi river, where the same flows along the banks of the said State, the complainant, and that whether said pollution is caused by a large discharge in the channel of said Sanitary District of Chicago, or a small discharge of water and sewage into said channel, cannot affect the principal question in the case, which is, whether or not the waters of the said Mississippi river, where the same flow along the banks of the said State, the complainant, are polluted, to the injury and detriment of the said complainant and the health of its people, so as to render said waters unfit for agricultural, domestic and manufacturing purposes, as alleged in said supplemental bill of complaint.

Wherefore, and for divers other errors and imperfections appearing in the said bill, the said defendants humbly pray the judgment of this honorable court, whether they shall be compelled to make any answer to such part of the said supplemental bill as is so demurred unto as aforesaid. And the said defendants humbly pray to be hence dismissed as to such part of said bill with their costs in this behalf most wrongfully sustained.

THE STATE OF ILLINOIS,
By H. J. HAMLIN,
Attorney General of the State of Illinois.
JAMES TODD,
P. C. HALEY,
Attorneys for the Sanitary District of Chicago.

JOHN G. DRENNAN,
WILLIAM M. SPRINGER,
Of Counsel.

118 I, William M. Springer, of counsel for said defendants, do certify that the above demurrer, is, in my opinion, well founded in point of law.

WILLIAM M. SPRINGER,
Of Counsel for Defendants.

I, William M. Springer, of counsel for said defendants, upon my oath do say that the above demurrer is not interposed for delay.

WILLIAM M. SPRINGER,
Of Counsel for Defendants.

Subscribed and sworn to before me this 10th day of May, 1901.

[L. S.] R. B. H. LYON,
Notary Public.

(Endorsed:) Supreme Court U. S., October term, 1900. No. 5, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Demurrer to part of supplemental bill. Filed May 13, 1901.

119 And on the same day, to wit, on the 13th day of May, A. D. 1901, an answer to the parts of the supplemental bill not demurred to was filed in the words and figures following, to wit:

120 In the Supreme Court of the United States, October Term, 1900. In Equity.

THE STATE OF MISSOURI, Complainant,
v.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
No. 5, Original.

The Answer of the Defendants to the Parts of the Supplemental Bill of Complaint to which a Demurrer Has Not Been Filed.

Now come the defendants in the above-entitled cause, not waiving their said demurrer, but relying thereon and saving and reserving unto themselves all benefit and advantage of exception to the many errors, uncertainties, and imperfections in the residue of said supplemental bill contained, for answer to so much of the supplemental bill of complaint as they are advised is material and necessary for said defendants to answer unto, do say:

121 That they deny that heretofore, to wit, on the 17th day of January, 1900, the said complainant filed in this honorable court, its original bill of complaint against said defendants; but defendants allege and the records of this court will show that on said 17th day of January, complainant moved the court for leave to file its said bill of complaint herein, and that said motion was not allowed by this court until five days thereafter, when said bill of complaint was filed in this court.

Defendants admit that said original bill of complaint contained the several allegations as alleged in complainant's supplemental bill of complaint, and defendants further admit that they were duly served with subpœnas issued out of this court, and did appear and file their demurrer to said original bill, and that said demurrer was by this court overruled on the said 28th day of January, 1901, and that thereupon defendants filed their separate answers herein to said original bill of complaint. Defendants further admit that, on the said 17th day of January, 1900, which was five days before said complainant's original bill of complaint was filed in this court, the *defendant, The Sanitary District of Chicago, did proceed to open* said channel or canal, and did permit and cause the sewage of the said Sanitary District of Chicago to flow therein, as stated in said defendant's separate answer heretofore filed in this cause.

But defendants deny that said sewage, so permitted to flow into the Des Plaines and Illinois rivers, has polluted the waters of the Mississippi river along the borders of the State of Missouri, and defendants deny that said sewage has destroyed the value of the waters in said river for primary uses, and for agricultural, manufacturing, drinking, and domestic purposes, and defendants deny that 122 said sewage, so permitted to flow into the Des Plaines and Illinois rivers, has heretofore caused sickness to persons living along the banks of said Mississippi river, in the State of Missouri, or that it will hereafter cause sickness to any such persons; but, on the contrary, defendants expressly aver, and, if permitted, will prove to this honorable court, that the turning into the Des Plaines river of the sewage of the Sanitary District of Chicago, together with the pure waters of Lake Michigan, which accompany the same, has not polluted or in any way impaired the value of the waters of the Mississippi river for primary uses, or for agricultural, domestic or manufacturing purposes, or in any manner injured the health of the inhabitants of complainant living on the banks of said river; but defendants aver that the large volume of pure water, which accompanies said sewage when it enters into the Des Plaines river, has improved the quality of the waters of the Illinois and Mississippi rivers, and also greatly improves the conditions which existed prior to the time when said sewage and waters were turned into said Des Plaines and Illinois rivers, as is fully explained in the separate answer of the defendant, The Sanitary District of Chicago, to the original bill of complaint filed herein, which said separate answer said defendants pray this honorable court to take and consider as their answer, not only to the original bill of complaint, but also in part to the supplemental bill filed herein.

And said defendants, further answering said bill of complaint and said supplemental bill, say: That the said city of St. Louis, situated about forty miles below the mouth of the said Illinois river, on the west bank of the said Mississippi river, in the State of complainant, having a population of 575,238 inhabitants by the Federal census of 1900, and suburban towns and villages, having a population of 50,000 in addition thereto, discharge their sewage and 123 filth into the said Mississippi river opposite said city; that said sewage and filth, coming directly and undefecated from the sewers of said city, towns, and villages, cause a much greater pollution of the waters of said river from said city to the southern boundary of said State than can possibly be produced by the waters coming from the said Illinois river, which waters have flown in their natural course for about three hundred and fifty-eight miles, after having received the sewage from the Sanitary District of Chicago; that said waters, so flowing for said distance in their natural course, have been relieved of their noxious character by the natural law relating to sewage and drainage and to running waters in large bodies, as fully explained and set forth in the separate answer of the Sanitary District of Chicago to the original bill of complaint in this cause; and that if it should appear that the waters of the said Mississippi river below the said city of St. Louis have been polluted or their value impaired for primary uses or for agricultural, domestic, and manufacturing purposes, or so polluted as to injure the health or endanger the lives of the inhabitants of said State, such pollution, impairment of value and unhealthful conditions cannot be imputed to the defendants in this cause, but, on the contrary, they must be imputed to the said city of St. Louis, a municipality in the State of complainant, and to its suburban villages and towns, whose aggregate population is over 625,000, or about one-half of the population of the drainage district of the Sanitary District of Chicago, whose sewage is now drained into the said Des Plaines and Illinois rivers.

And defendants, further answering said bill of complaint and said supplemental bill, say: That the intake of the water works and water supply of the said city of St. Louis is located on the west bank of said Mississippi river only about three miles below the 124 mouth of the Missouri river, which river is nearly as large as the Mississippi river at the point of confluence; that the waters of the Mississippi river flow in an easterly direction and bear directly across the said Mississippi river towards the Illinois shore, pressing upon that shore the water flowing from the Mississippi and Illinois rivers; that by this natural flow of the waters of all said rivers, the waters flowing from the Illinois river are pressed upon the east bank of the Mississippi river and do not mix with the waters flowing along the west bank of said Mississippi river until said waters have passed the intake of the water supply of the said city of St. Louis; that the waters received at the intake of said water supply of said city of St. Louis flow wholly from the Missouri river; that if said waters, so furnishing the water supply of said city, are polluted to any extent whatever, such pollution is caused by the sewage and filth from the cities and towns on the banks of said Missouri river above its mouth, many of which cities and towns are situated in the State of complainant.

And defendants further answering the said bill of complaint and said supplemental bill, say: That the Mississippi river, at the mouth of the Illinois river, is a much larger stream than is the Illinois river; that the flow of water from said Mississippi river at that point exceeds the flow from said Illinois river, under normal conditions, at

low water stage, about six times in quantity, even since the increased flow from the waters of Lake Michigan; that in consequence of this fact, the waters flowing from said Illinois river are pressed upon the Illinois shore, until said waters have passed the mouth of said Missouri river, and that at no point in said Mississippi river, below the mouth of said Illinois river and above the city of St. Louis, do the waters of said Illinois river reach a line west of the
125 center of said Mississippi river, which is the boundary line between the said State of Missouri and State of Illinois.

And defendants, as to all the matters and things charged in complainant's supplemental bill of complaint, expressly reiterate all allegations contained in their separate answers to the original bill of complaint filed herein, which may be applicable thereto. And defendants say that they have not, in and by the operation of the said system of sewage and drainage, as fully explained in their separate answers to the original bill of complaint, contaminated, polluted, or destroyed the water supply from the said Mississippi river and its tributaries, to the inhabitants, cities and towns, of the State of complainant, or injured the health of said inhabitants as in and by the original bill of complaint and said supplemental bill declared.

And, further answering, defendants deny each and every other allegation of said supplemental bill of complaint, not herein and hereby admitted, traversed, confessed or denied, and every matter, cause or thing in said supplemental bill contained, material or necessary for defendants to make answer unto, and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied. And said defendants are ready and willing to prove every allegation in this answer contained as this court may direct, and pray to be hence dismissed with their reasonable costs in this behalf most wrongfully sustained.

THE STATE OF ILLINOIS,
By H. J. HAMLIN,
Attorney General of the State of Illinois.
JAMES TODD AND
P. C. HALEY, Attorneys, and
JOHN G. DRENNAN AND
WILLIAM M. SPRINGER,
Of Counsel for the Sanitary District of Chicago.

(Endorsed:) Supreme Court U. S., October term 1900. No. 5, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Answer to parts of supplemental bill. Filed May 13, 1901.

126 And on the same day, to wit, on the 13th day of May, A. D. 1901, a replication was filed in the words and figures following, viz:

127 In the Supreme Court of the United States, October Term, 1900. In Equity.

THE STATE OF MISSOURI, Complainant, *vs.* THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.	No. 5, Original.

Replication.

Edward C. Crow, attorney general of Missouri.
B. Schnurmacher, of counsel.

128 In the Supreme Court of the United States. In Equity.

THE STATE OF MISSOURI, Complainant, *vs.* THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.	No. 5, Original.

Replication.

The repliant, The State of Missouri, saving and reserving to itself all and all manner of advantage of exception which may be had and taken to the many manifold errors, uncertainties and insufficiencies of the answers and amended answers of the defendants herein, for replication thereunto says that it does and will aver, maintain and prove its said bill and its supplemental bill to be true, certain and sufficient in the law to be answered unto by the said defendants, and each of them; and that the said answers of 129 said defendants, and each of them, are very uncertain, evasive and insufficient in law to be replied unto by this repliant; without that, that any other matter or thing in the said answers, or any or either of them, contained, material or effectual in the law to be replied unto, confessed or avoided, traversed or denied, is true.

All of which matters and things this repliant is ready to aver, maintain and prove, as this honorable court may direct, and respectfully prays as in its said bill and supplemental bill it has already prayed.

EDWARD C. CROW,
Attorney General of Missouri.

B. SCHNURMACHER, Of Counsel.

(Endorsed:) Supreme Court U. S., October term, 1900. No. 5, orig'l. The State of Missouri, complainant, *v.* The State of Illinois *et al.* Replication to answer to supplemental bill. Filed May 13, 1901.

130 And afterwards, to wit, on the 27th day of May, A. D. 1901, the following order appears of record, viz:

Supreme Court of the United States, October Term, 1900.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 5, Original.

This cause came on to be heard on the supplemental bill and the demurrer of the defendants to the fourth paragraph of the same.

On consideration whereof, it is now here ordered by the court
131 that said demurrer be and the same is hereby sustained.

May 27, 1901.

(Endorsed:) Supreme Court U. S. No. 5, original, October term, 1900. State of Missouri, complainant, *vs.* State of Illinois *et al.* Order sustaining demurrer to 4th paragraph of supplemental bill. Filed May 27, 1901.

132 And afterwards, to wit, on the 20th day of October, A. D. 1902, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 4, Original.

On motion of Mr. William M. Springer, of counsel for the defendants, leave is hereby granted to file a motion to dismiss this case for want of prosecution.

133 And on the same day, to wit, on the 20th day of October, A. D. 1902, a motion to dismiss and proof of service of same was filed in the words and figures following, viz:

134 In the Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE Sanitary District of Chicago, Respondents.
} No. 4, Original. In Equity.

Motion to Dismiss.

Come the said respondents by their solicitors, H. J. Hamlin, attorney general of the State of Illinois, in behalf of the State, and James Todd, John G. Drennan and William M. Springer, in behalf of the Sanitary District of Chicago, and move this honorable court to dismiss said cause for want of prosecution, and for the reasons therefor, they state :

First. Because it appears from the record of this court, that the bill of complaint was filed herein January 22, 1900, nearly two years ago; that proof of service of subpœnas was filed January 29, 1900; that the demurrer to bill was argued November 12th and 13th, 1900; that the demurrer was overruled January 28, 1901, and separate answers filed by respondents on the same day; that a supplemental bill was filed May 13, 1901; that demurrer was filed to the 4th paragraph of the supplemental bill and answer to the other parts of said bill May 13, 1901; that on the same day a replication was filed to the answers to the supplemental bill; and that on May 27, 1901, the demurrer to the 4th paragraph of the supplemental bill was sustained by the court.

Second. Because since May 27th, 1901, when the issues were by the pleadings joined for trial, an entire term of this court has
135 elapsed, and no effort has been made by the complainant to
further prosecute said cause or to sustain its said bill of complaint by testimony of any kind.

Third. Because the burden of proof is on the complainant to establish by competent evidence the allegations in its bill, which it has wholly failed to do.

Fourth. Because the pending of said cause is a constant menace to respondents and has a tendency to create doubt and mistrust as to the utility and success of the great sanitary canal which they have constructed, and necessarily retards the improvement of the same.

Fifth. Because respondent, The Sanitary District of Chicago, has been subjected to great expense in the preparation for a trial of said cause, and such expense must continue until it is definitely determined whether there is to be a trial of the issues of fact in said cause.

Respectfully submitted,

H. J. HAMLIN,
Attorney General of Illinois.
JAMES TODD,
JOHN G. DRENNAN,
By WM. M. SPRINGER,
WM. M. SPRINGER,
Solicitors for Respondents.

137 UNITED STATES OF AMERICA, } *ss:*
District of Columbia, }

William M. Springer, being first duly sworn according to law, deposes and says; that he is one of the solicitors for respondents in the case of The State of Missouri *v.* The State of Illinois and The Sanitary District of Chicago, now pending in the Supreme Court of the United States; that on the 16th day of October, A. D. 1902, this affiant deposited in the mail the motion to dismiss, the notice to attorneys of record for the claimant and brief of counsel for respondents in said cause to the proper addresses of said counsel, and duly posted the same at such time as to reach them by due course of mail, three weeks before the time fixed by the said notice. That said letters were registered and receipt of postmaster at Washington, and registry return receipt, signed by E. C. Crow, attorney general of Missouri, are hereto attached.

WILLIAM M. SPRINGER,
Solicitor for Respondents.

Subscribed and sworn to before me this 20th day of October, 1902.

JAMES D. MAHER,
[SEAL.] Notary Public, District of Columbia.

Endorsed: Supreme Court U. S., October term, 1902. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion to dismiss and proof of service. Filed Oct. 20th, 1902.

138 And afterwards, to wit, on the 10th day of November, A. D. 1902, an order for appearance for the complainant was filed in the words and figures following, viz:

Order for Appearance.

Supreme Court of the United States, October Term, 1902.

STATE OF MISSOURI, Complainant,
vs.
STATE OF ILLINOIS ET AL.

144 (Endorsed:) Supreme Court U. S., October term, 1902. Term No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion for appointment of Frank S. Bright as special commissioner to take testimony. Filed Nov. 10, 1902.

In the Supreme Court of the United States, October Term, 1902. In Equity.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
No. 4, Original.

Stipulation as to Taking of Testimony.

Now come the plaintiff and defendants in the above entitled case, by their attorneys respectively, and submit to this honorable court that an order may be entered in this case as follows:

Ordered by the court, that Mr. Frank S. Bright, a member of this bar and resident of the District of Columbia, be appointed a com-

missioner to take the testimony in this case; that the taking of testimony will begin on the first day of December, 1902, at such place as counsel for the plaintiff may indicate, notice of ten days as to the place to be furnished the counsel for the defendants; that the taking of such testimony for and on behalf of plaintiff may continue until the first day of March, A. D. 1902, at which time the
145 plaintiff shall conclude the taking of such testimony; that thereafter, commencing on the first day of March, 1902, the testimony in behalf of defendants shall be taken and shall be concluded on or before the first day of June, A. D. 1902. Ten days' notice as to the place where said testimony for the defendants shall be taken shall be given to counsel for the plaintiff; that thereafter rebutting testimony on behalf of the plaintiff may be taken at such place as counsel for plaintiff may indicate, five days' notice being given to counsel for defendants as to the place where such rebutting testimony shall be taken, plaintiff being required to conclude the taking of such rebutting testimony on or before the fifteenth day of June, A. D. 1902. The defendants shall then conclude the taking of any further testimony on or before the first day of July, A. D. 1902, at which time all of the testimony in said case shall be concluded.

One-half of the compensation and expenses of the commissioner shall be advanced by the plaintiff and one-half by the defendant The Sanitary District of Chicago, and each side shall pay such fees to its witnesses as may be necessary to secure their attendance, but not exceeding the fees allowed by law in such cases, the costs of the case to be taxed by the court on the final disposition of the case, to be paid in such manner as the court may at any time determine.

The commissioner shall be allowed twenty dollars per day for his compensation and his actual traveling and hotel expenses, an itemized statement of which shall be submitted to the court in his final report. He shall report to the court a stenographic copy of the testimony taken by him, to be furnished to him by the parties to the suit, but he shall not report any findings of facts or his con-
146 clusions of the law. The said commissioner shall have the powers and perform the duties of a master in chancery as provided in rules of this court, and said rules shall apply in all respects to the proceedings to be taken under this order.

All of which is respectfully submitted.

(Endorsed:) Supreme Court U. S., October term, 1902. Term No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Stipulation as to appointment of commissioner and as to taking testimony. Filed Nov. 10th, 1902.

147 And afterwards, to wit, on the 17th day of November, A. D. 1902, the following order appears of record, viz:

148 Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 4, Original.

This cause coming on to be heard on the application of the parties, duly appearing by their counsel, for the appointment of a special commissioner to take testimony herein, and their stipulation in regard to the same heretofore filed by leave, and said application and stipulation having been duly considered:

It is ordered, That Mr. Frank S. Bright, a member of this bar and a resident of the District of Columbia, be and he is hereby appointed a commissioner to take and return the testimony in this cause, with the powers of a master in chancery as provided in the rules of this court; but said commissioner shall not make any findings of fact or state any conclusions of law.

It is further ordered, That the taking of testimony on complainant's behalf shall begin on the first day of December, A. D. 1902, at such place as counsel for complainant may designate, ten days' notice thereof to be given counsel for defendants; and shall be concluded on or before the twenty-eighth day of February, A. D. 1903; that the taking of testimony on behalf of defendants shall commence on the second day of March and be concluded on or before the first day of June, A. D. 1903, ten days' notice of the place where such testimony will be taken being given to counsel for complainant; that testimony in rebuttal shall then be taken, five days' notice of the place being given, and shall be concluded on or before the fifteenth day of June, A. D. 1903; and thereafter defendants may take further testimony until the first day of July, A. D. 1903, at which time the taking of testimony in the cause shall be closed.

Said commissioner shall report to the court the testimony taken by him, without findings of fact or conclusions of law, with all convenient speed, and shall receive, as agreed by the parties, twenty dollars per day for his compensation, and his actual expenses, an itemized statement of which shall accompany his report.

November 17, 1902.

149 (Endorsed:) Supreme Court U. S., October term, 1902. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Order appointing Frank S. Bright commissioner to take testimony, &c. Filed November 17, 1902.

150 And afterwards, to wit, on the 19th day of November, A. D. 1902, the oath of Frank S. Bright as commissioner was filed in the words and figures following, viz:

151 I, Frank S. Bright, a commissioner designated and appointed by the Supreme Court of the United States to take and return the testimony in the cause of The State of Missouri, complainant, *vs.* The State of Illinois *et al.*, (No. 4 original of Oct. term, 1902), do solemnly swear that I will faithfully and impartially discharge and perform all the duties devolved on me as such commissioner, according to the best of my abilities and understanding: So help me God.

FRANK S. BRIGHT.

Subscribed and sworn to before me this 19th day of November, A. D. 1902.

JAMES D. MAHER,
[SEAL.] Notary Public, District of Columbia.

Endorsed: Supreme Court U. S., October term, 1902. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Oath of Frank S. Bright as commissioner. Filed Nov. 19, 1902.

152 And afterwards, to wit, on the 2d day of February, A. D. 1903, a motion to modify order as to taking testimony was filed in the words and figures following, viz:

153 In the Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
v.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Respondents.
} No. 4, Original. In Equity.

Motion to Modify Order for Taking Testimony.

William M. Springer, on behalf of solicitors for plaintiff and defendants.

153½ Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 4, Original.

Motion to Modify Order for Taking Testimony.

Now come the solicitors for plaintiff and defendants in the above-entitled cause, and move the court to modify the order for the appointment of a special commissioner to take testimony in this case, entered November 17, 1902, so that the second paragraph of said order will read as follows:

It is further ordered, that the taking of testimony on complainant's behalf shall begin on the fifth day of March, A. D. 1903, at such place as counsel for complainant may designate, ten days' notice thereof to be given counsel for defendants, and shall be concluded on or before the thirtieth day of April, A. D. 1903; that the taking of testimony on behalf of defendants shall commence on the first day of May, and be concluded on or before the first day
154 of July, A. D. 1903, ten days' notice of the place where such testimony will be taken being given to counsel for complainant; that testimony in rebuttal shall then be taken, five days' notice of the place being given, and shall be concluded on or before the fifteenth day of July, A. D. 1903; and thereafter defendants may take further testimony until the first day of August, A. D. 1903, at which time the taking of testimony in the cause shall be closed.

This motion is submitted on account of the serious illness of Attorney General Crow, one of the solicitors on behalf of the complainant.

WILLIAM M. SPRINGER,
On Behalf of the Solicitors for the
Plaintiff and Defendants.

(Endorsed:) Supreme Court U. S., October term, 1902. No. 4, orig'l. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion to modify order as to taking testimony. Filed Feb'y 2, 1903.

155 And on the same day, to wit, on the 2d day of February, A. D. 1903, the following entry appears of record, viz:

156 Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
No. 4, Original.

On motion of Mr. William M. Springer, of counsel for defendants, it is ordered by the court that the order entered on November 17th, 1902, providing for the taking of testimony in this cause be, and the same is hereby modified so as to provide that the taking of testimony on complainant's behalf shall begin on the 5th day of March, 1903, at such place as counsel for the complainant may designate, ten days' notice thereof to be given counsel for the defendants, and shall be concluded on or before April 30th 1903; that the taking of testimony on behalf of defendants shall commence May 1st, 1903, and be concluded on or before July 1st, 1903, ten days' notice of the place where such testimony will be taken being given to counsel for complainant; that the testimony in rebuttal shall then be taken, five days' notice of the place being given, and shall be concluded on or before July 15th, 1903; and thereafter defendants may take further testimony until August 1. 1903, at which time the taking of testimony in the cause shall be closed.

February 2d, 1903.

157 And afterwards, to wit, on the 2d day of March, A. D. 1903, an order for appearance for the complainant was filed in the words and figures following, viz:

Order for Appearance.

Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 4, Orig'l.

The clerk will enter my appearance as counsel for the complainant.

(Name.) WM. F. WOERNER,
(P. O. Address.) —— ——.

☞ NOTE.—Must be signed by a member of the bar of the Supreme Court United States. Individual and not firm names must be signed.

[Endorsed:] Supreme Court U. S., October term, 1902. Term No. 4, or'g'l. Appearance for compl't. Filed Mar. 2, 1903.

158 And on the same day, to wit, on the 2d day of March, A. D. 1903, a stipulation as to taking testimony was filed in the words and figures following, viz:

159 In the Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE Sanitary District of Chicago, Defendants.
} No. 4, Original. In Equity.

Stipulation as to Taking Testimony.

Now come the complainant and defendants in the above entitled cause, by their respective attorneys and by agreement submit to this honorable court that the orders heretofore made in this cause as to the time in which and for which the respective parties are required to take and complete the taking of their testimony be set aside, and that the following order in relation thereto be made:

1st. It is hereby ordered by the court that the orders here-
160 tofore entered in this case in reference to the time in which
and for which the respective parties are required to take and complete the taking of their testimony be set aside.

2nd. That the complainant having heretofore taken testimony from February 17th to the 28th inclusive, may resume the taking of testimony on March 9, 1903, and shall conclude on or before the 21st day of April thereafter.

3rd. That the defendants may begin the taking of testimony in the city of Chicago in the State of Illinois, on the 23rd day of April, 1903, and shall conclude on or before the 19th day of June, thereafter.

4th. That thereafter rebutting testimony on behalf of the complainant may be taken at such time and place as counsel for complainant may designate, such rebutting testimony to be concluded on or before the 26th day of June, 1903.

5th. That the defendants shall then conclude by taking any further testimony they may desire in rebuttal on or before the 3rd day of July, 1903, at which time all the testimony in the cause shall be concluded unless the counsel on both sides shall mutually agree to a further extension of time for concluding the taking of testimony, and such agreement, if made, shall have the same effect as an order made by the court.

6th. Either party may use any time in taking rebuttal testimony, not exceeding ten days in all, which may not be used by them in taking testimony in chief, and in that event the dates for beginning and concluding the taking of testimony by the respective parties, as set forth above, shall be changed accordingly.

Both parties to this stipulation hereby waive formal notice
161 of the times and places for beginning and concluding the
taking of testimony as provided in the foregoing order, if made by the court.

STATE OF MISSOURI,

WILLIAM M. SPRINGER,
Att'ys Sanitary Dist. of Chicago.

CHARLES W. BATES,
WM. F. WOERNER,
Of Counsel for Complainant.

(Endorsed :) Supreme Court U. S., October term, 1902. No. 4, orig'l. The State of Missouri, complainant, *v.* The State of Illinois *et al.* Stipulation as to taking testimony. Filed March 2, 1903.

162 And on the same day, to wit, on the 2d day of March, A. D. 1903, the following entry appears of record, viz :

THE STATE OF MISSOURI, Complainant, } No. 4, Original.
vs.
THE STATE OF ILLINOIS ET AL. }

Mr. William F. Woerner, for the complainant, submitted to the consideration of the court a stipulation of counsel in regard to the taking of testimony in this cause.

163 And afterwards, to wit, on the 3d day of March, A. D. 1903, the following order appears of record, viz :

164 Supreme Court of the United States, October Term, 1902.

THE STATE OF MISSOURI, Complainant, } No. 4, Original.
vs.
THE STATE OF ILLINOIS ET AL. }

On consideration of the stipulation of counsel as to the taking of testimony in this cause, filed and submitted herein on March 2d, 1903,

It is now here ordered by the court that in addition to the testimony heretofore taken herein the parties may resume the taking of testimony on March 9th, 1903, and proceed with all convenient speed so that all of the testimony shall be filed in the office of the clerk of this court on or before Monday, October 12th next.

March 3, 1903.

Endorsed : Supreme Court U. S. No. 4, original, October term, 1902. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Order as to taking testimony. Filed Mar. 3, 1903.

165 And afterwards, to wit, on the 13th day of October, A. D. 1903, the following entry appears of record, viz :

THE STATE OF MISSOURI, Complainant, } No. 4, Original.
vs.
THE STATE OF ILLINOIS ET AL. }

On motion of Mr. William C. Prentiss, in behalf of counsel for all the parties, leave is hereby granted to file the preliminary report of the commissioner herein, and it is ordered by the court that the time for taking testimony herein be extended to January 1, 1904.

166 And on the same day, to wit, on the 13th day of October, A. D. 1903, a preliminary report of the commissioner was filed in the words and figures following, viz:

167 In the Supreme Court of the United States.

In re THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
Original, Number 4.
October Term, 1903.

To the honorable the Supreme Court of the United States:

As the duly appointed commissioner in the above entitled cause, I beg to report that on the 17th day of February, 1903, I opened my commission in said cause at the city of St. Louis and have since continued to execute it.

I beg further to report, that since the last extension of time by the court for the taking of testimony in said cause, the parties have been diligently engaged in pursuance of the court's order, and are now so engaged, and that I have taken some 8500 pages of testimony, but considerable further time will be required to complete the testimony.

I am advised that the parties to said cause will on the sitting of the court on the 12th day of October, 1903, move the court to extend the time for taking testimony in said cause until January 1st, 1904. In the event that said motion is granted, I will comply with such order as the court may make in the premises. In the event that such motion is denied, I will at once close my commission and return the record to the court as heretofore ordered.

Respectfully submitted,

FRANK S. BRIGHT,
Commissioner of the Supreme Court of the U. S.

Chicago, Illinois, October 7th, 1903.

168 Endorsed: In the Supreme Court of the United States. The State of Missouri *vs.* The State of Illinois and The Sanitary District of Chicago. Original No. 4. Oct. term, 1903. Preliminary report of Frank S. Bright, commissioner. Office of the clerk. Received Oct. 9, 1903. Supreme Court U. S.

Endorsed: Supreme Court U. S., October term, 1903. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Preliminary report of Frank S. Bright, commissioner. Filed Oct. 13th, 1903.

169 And on the same day, to wit, on the 13th day of October, A. D. 1903, a motion to extend time to take testimony was filed in the words and figures following, viz:

170 In the Supreme Court of the United States, October Term, 1903.

THE STATE OF MISSOURI, Complainant, *vs.* THE STATE OF ILLINOIS and THE Sanitary District of Chicago, Defendants.	No. 4, Original. In Equity.

Motion to Extend the Time for Taking Testimony.

Comes now William M. Springer, of counsel for defendants in the above entitled cause and submits to the court herewith a stipulation signed by the counsel for complainant and defendants respectively asking an extension of the time for taking the testimony in said cause, and moves the court to enter an order in conformity with said stipulation for the reasons stated therein.

WILLIAM M. SPRINGER,
Attorney for Defendants.

Endorsed: Supreme Court U. S., October term, 1903. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion that the time for taking testimony be extended. Filed Oct. 13th, 1903.

171 And on the same day, to wit, on the 13th day of October, A. D. 1903, a stipulation that time for taking testimony be extended was filed in the words and figures following, viz:

172 In the Supreme Court of the United States, October Term, 1903.

THE STATE OF MISSOURI, Complainant, *vs.* THE STATE OF ILLINOIS and THE Sanitary District of Chicago, Defendants.	No. 4, Original. In Equity.

Stipulation as to the Taking of Testimony.

Now come the complainant and the defendants in the above entitled cause, by their attorneys respectively, and by agreement submit to this court that the order heretofore entered in this case requiring the taking of testimony in this case to be closed and the testimony submitted to the court on the first day of this term, be rescinded, and an order entered requiring counsel to conclude the taking of testimony at the earliest time practicable, not later than January 1st, 1904; and that when all the testimony is taken, the special commissioner, Frank S. Bright, Esq., may be directed to report the same to this honorable court without any findings of fact or conclusion of law.

The reasons for asking this further extension of time are as follows:—

1. The attorney general and the assistant attorney general of Missouri, who represent the complainant, were compelled to ask delays in the taking of testimony, on account of other business of the State which imperatively required their attention, and were not able to conclude complainant's testimony in chief until July 6th, 1903.

2. That defendants began the taking of testimony in their behalf on the 10th day of July, and continued without interruption until
the 24th day of that month. At that time, on account of
173 pressing engagement of counsel for complainant, a postponement was agreed upon until August 10th, at which time the taking of testimony was renewed and continued until August 18th; at which time another postponement was agreed upon on account of the pressing engagements of counsel for complainant.

3. The great flood in the month of June last prevented communication with St. Louis for two or three weeks.

4. The amount of testimony which has been taken and which will be taken hereafter far exceeds the expectations of counsel at the beginning of the litigation.

5. In view of the facts above set forth, it will be utterly impossible for defendants to conclude the taking of their testimony in chief at the time the court convenes for the October term, 1903, even if it is continued from day to day without any interruption.

All of which is respectfully submitted.

STATE OF MISSOURI.

THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
Original, No. 4.

Comes now the complainant by its attorney-general, Edward C. Crow, and moves the court to pass its order herein authorizing complainant to have the record herein printed at such place as may be selected by complainant (provided said record is printed in conformity with the rules of the court for the printing of records); that said record shall be printed under the supervision of the commissioner herein, and when so printed the usual number of the printed copies of said record shall be returned to the court by said commissioner, together with the original record herein, and that this cause shall thereafter be proceeded with upon said printed record so returned by said commissioner as the printed record in this case; that
177 for the purpose of having said record printed as aforesaid, said commissioner shall be authorized to turn over to the printer from time to time such portions of the original record as may be necessary for the use of the printer.

Further, that there shall be omitted from said printed record such portion of the original record as solicitors for the respective parties shall agree in writing, to be immaterial, but that all of said original record shall be returned to the court by the commissioner to the granting of all of which said motion defendants assent as is evidenced by the signatures of their solicitors hereto.

Further, that such exhibits as cannot be reproduced and incorporated in the record shall be returned to the court by the commissioner with the original record.

178 (Endorsed:) Supreme Court U. S., October term, 1903. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion for order to print record. Filed Dec. 14, 1903.

179 And on the same day, to wit, on the 14th day of December, A. D. 1903, a motion for extension of time for taking testimony was filed in the words and figures following, viz:

180 In the Supreme Court of the United States, October Term, 1903.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
} Original, No. 4.

Comes now the complainant by its attorney-general, Edward C. Crow, and showing to the court that certain continuances in the taking of testimony herein having been rendered necessary by engagements of complainant's solicitors, since the last extension by the court of the time for taking testimony, said continuances having been granted upon motion of complainant.

And showing further that owing to said continuances time, in addition to that heretofore granted by the court will be required to complete the taking of the testimony herein, leave being first had therefor, moves the court, will be required to complete the taking of

the testimony herein, until the first day of April, 1903, and
181 that on said first day of April, 1903, or as soon thereafter as possible the commissioner herein shall return to the court all the testimony taken by him, without findings of fact or conclusions of law, to the granting of which said motion defendants assent, as is evidenced by the signatures of their solicitors hereto attached.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago, Defendants.
} Original, No. 4.

Sam B. Jeffries, being first duly sworn, deposes and says that he is assistant attorney-general of the State of Missouri, and as such, has assisted in the conduct of this case on behalf of complainant; that since the granting by the court of the last extension of time for taking testimony in this case until January 1, 1904, complainant's solicitors have been compelled to ask continuances of the taking of testimony in order to attend to other matters of the State of Missouri devolving upon them, which could not be delayed; that by reason of the foregoing continuances, defendants have not been able to complete the taking of their testimony, and that there will be required to complete the record in this case about three months, in addition to the time heretofore granted by the court as this affiant is informed by counsel for the defense, and that it will require about one week for the taking of complainant's rebuttal testimony.

SAM B. JEFFRIES.

Subscribed and sworn to before me this 8th day of December, 1903.

My term expires January 22, 1907.

[SEAL.] GEO. A. BOCKRATH,
Notary Public, Cole County, Missouri.

(Endorsed:) Supreme Court U. S., October term, 1903. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion for extension of time for taking testimony. Filed Dec. 14, 1903.

183 And on the same day, to wit, on the 14th day of December, A. D. 1903, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 4, Original.

On motion of Mr. Frank S. Bright, in behalf of counsel, it is ordered by the court that the time for taking testimony herein be, and the same is hereby, extended to April 1st, 1904.

184 And afterwards, to wit, on the 11th day of April, A. D. 1904, the following entry appears of record, viz:

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS ET AL.
} No. 4, Original.

On motion of Mr. W. F. Woerner, of counsel for the complainant, it is ordered by the court that the time for taking testimony herein be, and the same is hereby, extended to June 1st next.

185 And on the same day, to wit, on the 11th day of April, A. D. 1904, a motion to extend time for taking testimony was filed in the words and figures following, viz:

186 In the Supreme Court of the United States, October Term, 1903.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY DISTRICT of Chicago, Defendants.

} No. 4, Original.

Mr. S. B. Jeffries, of counsel for the complainant, submitted to the consideration of the court a motion to fix a day for the argument of this cause.

194 And on the same day, to wit, on the 29th day of May, A. D. 1905, the report of the commissioner as to taking testimony was filed in the words and figures following, viz:

195 Office Supreme Court U. S. Filed May 29, 1905. James H. McKenney, Clerk.

In the Supreme Court of the United States.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY District of Chicago.
} Original, No. 4.

Report of Commissioner.

To the honorable the Chief Justice and the associate justices of the Supreme Court of the United States:

The undersigned commissioner, appointed by an order entered in the said cause on November 17, 1902, to take and return such evidence as the parties to said cause should produce, respectfully reports to the court that pursuant to the said order and the stipulation of counsel of the said parties, he opened the commission conferred on him in the chambers of the city counselor, in the city hall, in the city of St. Louis, Missouri, February 17, 1903, at ten o'clock a. m., and, the parties to the cause being present by their respective counsel, proceeded to execute the said commission on that day and on the subsequent days, and at that place and at the other
196 places indicated in the record, until the 28th day of May, 1904, when the said commission was declared closed without day.

That said commission was executed by receiving the testimony of the witnesses named in it, who were sworn to testify to the truth, the whole truth, and nothing but the truth, before giving their evidence, and the testimony so given by them was taken down word for word by a stenographer in the presence of the undersigned, and, when transcribed, read over to the said witnesses respectively (or read over by them) and signed by them, respectively, in the presence of the undersigned and the respective counsel (except as otherwise appears in the testimony), and, further, by receiving the documents, maps, charts, materials, and diagrams produced and offered in evidence as exhibits by the parties to the said cause, and designated and marked as appears in the record, all being identified by the signature of the undersigned as commissioner, which said evidence is all the evidence that was offered before him by the parties to the said cause, and is contained in eight bound volumes filed herewith, marked with the title of the cause and consisting of 13,160 pages of typewritten evidence, and in said exhibits.

That the commissioner has deposited said testimony with James H. McKenney, Esquire, clerk of the Supreme Court of the United States, and has filed all said exhibits, so marked as aforesaid, with the said James H. McKenney, except Complainant's Exhibits 14, 15, 16, 18, 19, 20, 43, and 45, and Defendants' Exhibits Jordan 197 A, B, C, and D; Randolph's B, and Spencer's A, B, and C, which have been filed with the marshal of the Supreme Court under the provisions of the 33d rule.

The commissioner has also filed herewith a table of witnesses examined and the pages at which their testimony may be found; an alliterated index of the names of the witnesses and the page at which their testimony is found; also an index of said exhibits showing the pages of the record on which they were offered; also a description of said exhibits by serial numbers; also an itemized statement of the expenses of the commissioner, as required by the said order of the court, said statement being filed with the clerk of the court, the amount covered thereby having been paid in equal portions by the parties to said cause.

The commissioner was engaged in going to, attendance upon and returning from the hearings of the testimony and in preparing the record to be returned to the court four hundred and fifty-five days, for which, by the rule of the court, he was to be paid in equal parts by complainant and defendants at the rate of twenty dollars per day. The share of said compensation due by defendants has been paid in full and that part unpaid by the complainant has been assured to the commissioner.

Respectfully submitted, FRANK S. BRIGHT,
Commissioner.

May 29, 1905.

(Endorsed:) Supreme Court U. S., October term 1904. No. 4, original. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Report of commissioner as to taking testimony. Filed May 29, 1905.

198 And on the same day, to wit, on the 29th day of May, A. D. 1905, a report of the commissioner as to printing of testimony was filed in the words and figures following, viz:

199 In the Supreme Court of the United States.

The State of Missouri, Complainant,
vs.
The State of Illinois and The Sanitary District of Chicago, Defendants.
} Original, No. 4.

Report of Commissioner as to Printing of Testimony.

To the honorable the Chief Justice and the associate justices of the Supreme Court of the United States:

The undersigned commissioner has the honor to report that, in pursuance of the order of the court, entered in said cause on the 14th day of December, 1903, wherein it was provided that the record in the above entitled case should be printed under the supervision of the commissioner, and when so printed the usual number of printed copies should be returned to the court by the commissioner, 200 and that said cause should thereafter be proceeded with upon such printed record, so returned by said commissioner, as the printed record in said case, there has been printed under his supervision the testimony taken by him and heretofore filed by him in said cause, and he has this day deposited 25 copies of said testimony, so printed as aforesaid, with James H. McKenney, Esquire, clerk of the Supreme Court of the United States.

That under the authority granted by said order of the court, the undersigned from time to time furnished the printer designated by complainant with consecutive parts of the original record; that the printer thereupon prepared a proof of the part furnished him, which he returned with said portion of the original record, and the undersigned thereupon compared said proof with the original record, until when produced it was a literal reproduction of said original record, and as deposited with this clerk said printed record is word for word a copy of the original 13,160 pages of manuscript, which as printed, consists of 7,975 pages contained in eight volumes.

That none of the exhibits filed in the case has been reproduced.

There has also been deposited with the clerk of the court an index of the evidence showing the volume and page of both the 201 original and printed records, upon which the evidence is found; also an alliterated index of the names of the witnesses and the pages of their testimony; also an index of the exhibits and the name of the witness to whose testimony they were offered as exhibits.

That by agreement between counsel for complainant and the commissioner, his compensation for supervising the printing of the record, as aforesaid, is to be settled by the court.

Wherefore the undersigned prays the court to fix the amount of his said compensation.

Respectfully submitted, FRANK S. BRIGHT,
Commissioner.

May 29, 1905.

(Endorsed:) Supreme Court U. S., October term, 1904. No. 4, original. The State of Missouri, complainant, *vs*. The State of Illinois *et al*. Report of commissioner & motion to fix his compensation for supervising the printing of the testimony. Filed May 29, 1905.

202 And on the same day, to wit, on the 29th day of May, A. D. 1905, a motion to open and publish testimony and print pleadings was filed in the words and figures following, viz:

203 In the Supreme Court of the United States.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY DIStrict of Chicago, Defendants.
} Original, No. 4.

Motion to Open and Publish Testimony and Print Pleadings.

The State of Missouri by Herbert S. Hadley, its attorney general.

204 In the Supreme Court of the United States.

THE STATE OF MISSOURI, Complainant,
vs.
THE STATE OF ILLINOIS and THE SANITARY DIStrict of Chicago, Defendants.
} Original, No. 4.

To the honorable the Chief Justice and the associate justices of the Supreme Court of the United States:

Comes now the complainant by its attorney general Herbert S. Hadley, and showing to the court that the commissioner heretofore appointed by order of the court to take and return the testimony in the above entitled cause has this day deposited with the clerk of this court the depositions taken by him as commissioner and has deposited the exhibits referred to in said depositions, part with the clerk of this court and part with the marshal, as more specifically appears from the report of said commissioner, moves the court for leave to file said depositions, open and publish them and to file said exhibits.

And the complainant showing further that by rule entered herein on the 14th day of December, 1903, it was ordered that the record herein should be printed by the complainant under the supervision of the commissioner, and that when so printed this cause 205 should be heard on said record printed under the supervision of the commissioner as aforesaid as the printed record in the cause, and that said commissioner has this day deposited with the clerk of the court twenty-five copies of the testimony taken before him, printed pursuant to said order of December 14, 1903, and has also filed in manuscript an index thereof, the complainant moves the court to enter an order to fix the compensation of the commissioner for his services in supervising the printing of said record and an order for printing the usual number of copies of the pleadings and motions and said index upon complainant's advancing to clerk of the court his fees for printing and supervising the printing of said pleadings, motions and index, as by the rule of this court is provided.

THE STATE OF MISSOURI,
By HERBERT S. HADLEY,
Its Attorney General.

CHARLES W. BATES,
SAMUEL B. JEFFRIES,
Of Counsel.

Defendants assent to the granting of the above motions.

STATE OF ILLINOIS,
By W. H. STEAD,
Its Attorney General.
THE SANITARY DISTRICT
OF CHICAGO,

James Todd and John G. Drennan, solicitors for Sanitary District of Chicago.

209 In the Supreme Court of the United States.

The State of Missouri, Complainant,
vs.
The State of Illinois and The Sanitary District of Chicago, Defendants.
} Original, No. 4.

Motion.

Now comes the complainant, by its attorney-general, Herbert S. Hadley, and moves the court to set the above entitled cause for hearing at a day to be named by the court in the October term, 1905.

That an order shall be entered that the case be heard upon the pleadings, the evidence taken by the respective parties, and the briefs of the respective parties.

That the briefs of the complainant shall be filed with the clerk of the court, and copies thereof shall be served upon the solicitors of each of the defendants not later than the 30th day of August, 1905.

That reply briefs of defendants shall be filed with the clerk of the court, and copies thereof served upon the solicitors for complainant not later than the 15th day of October, 1905; and that complainant's reply brief shall be filed with the clerk, and copies 210 served on defendants' solicitors not later than one week before the day set by the court for the hearing of the cause.

That Complainant's Exhibits Nos. 1 to 13, both inclusive, Nos. 21 and 22, and the charts prepared by Professor Keizer, Nos. 23 to 35, both inclusive, and all of Professor Teichman's charts, Nos. 52 to 70, both inclusive, shall be withdrawn by complainant and reproduced, and when reproduced copies thereof shall be served upon the defendants' solicitors, the same to be done on or before the date of the filing of complainant's brief as hereinabove set forth: Provided, however, that any or all of complainant's exhibits not heretofore printed may be withdrawn and reproduced in accordance with the terms hereof.

To the granting of all of which said motion defendants assent, as is evidenced by the signatures hereto of their respective solicitors.

HERBERT S. HADLEY,
Attorney-General of Missouri.
CHAS. W. BATES,
City Counselor of St. Louis, and
SAM B. JEFFRIES,
Solicitors for Complainant.

W. T. STEAD,
Attorney-General of Illinois.
H. J. HAMLIN,
Solicitor for State of Illinois.
JAMES TODD AND
JOHN G. DRENNAN,
Solicitors for Sanitary District of Chicago.

211 (Endorsed:) Supreme Court U. S., October term, 1904. The State of Missouri, complainant, *vs.* The State of Illinois *et al.* Motion to fix day for hearing and as to filing briefs and withdrawing exhibits and consent thereto. Filed May 29, 1905.

212 And on the same day, to wit, on the 29th day of May, A. D. 1905, the evidence returned by the commissioner was opened, published and filed.

(Which said evidence, as printed under the supervision of the commissioner, accompanies this record, marked vol. 1, 2, 3, 4, 5, 6, 7 & 8.)

IN THE

Supreme Court of the United States.

DESCRIPTION OF ALL EXHIBITS OFFERED, SHOWING PAGES OF ORIGINAL AND PRINTED RECORDS ON WHICH EXHIBITS ARE OFFERED.

COMPLAINANT'S EXHIBITS.

1.—Ravold. Chart showing bacteria per cubic centimeter, year 1900, at various points. Page 579 original, 364 print.

2.—Ravold. Results showing mixture of waters, Mississippi and Missouri at Intake. Page 608 original, 381 print.

3.—Ravold. Chart showing numbers of bacteria from Mississippi river at Grafton and heights of Mississippi river at Louisiana, Missouri. Page 613 original, 385 print.

4.—Ravold. Weekly averages of number of bacteria collected daily from the Mississippi river at Grafton, together with heights of river at Grafton. Page 617 original, 387 print.

5.—Ravold. Numbers of bacteria collected at Hartford, together with height of the river at that point. Page 621 original, 390 print.

6.—**Ravold.** Number of bacteria at Bellefontaine, Missouri river, with height of that river there. Page 626 original, 393 print.

7.—**Ravold.** Numbers of bacteria at Chain of Rocks, Missouri shore, together with height of river there. Page 632 original and 397 print.

8.—**Ravold.** Weekly average numbers of bacteria, water collected in Mississippi river, Chain of Rocks, Illinois shore, with height of river there. Page 636 original, 400 print.

9.—**Ravold.** Weekly average number of bacteria, samples of water collected from Mississippi river, Chain of Rocks, Intake Tower, with height of river at that point. Page 643 original, 404 print.

10.—**Ravold.** Curve showing weekly averages of river stages at St. Louis, number of typhoid cases and deaths, 1890-1900. Page 718 original, 449 print.

11.—**Ravold.** Result determinations of bacteria in samples from Drainage Canal at Lockport, below Ruby Street Bridge and Brandon Bridge, Joliet. Page 727 original, 455 print.

12.—**Ravold.** Results of daily determinations, water collected at Peoria, 1901. Page 735 original, 460 print.

13.—**Ravold.** Daily determinations, number of bacteria, from samples of water collected at Grafton, Illinois river, 1901. Page 738 original, 462 print.

14.—**Benezette Williams.** Map of Sanitary District of Chicago. Page 825 original, 515 print.

15.—**Moore, Jas. A.** Apparatus for taking samples. Page 947 original, 590 print.

16.—**Taylor, Henry R.** Water bottle used for taking samples. Page 1015 original and 631 print.

17.—**Brown, F. J.** Specimen tag. Page 1020 original, 634 print.

18, 19, 20.—**Teichmann.** Bottles used for taking sample. Page 1063 original, 660 print.

21.—**Ravold.** Chart showing course of typhoid fever in Hamburg, before and after filtration of water supply. Page 1206 original, 745 print.

22.—Ravold. Chart showing cases and deaths from typhoid fever in St. Louis, January, 1890, to September 28, 1894; September 28, 1894, to December, 1902. Page 1245 original, 767 print.

23.—Keiser. Curve showing changes in nitrites, January 24 to October 10, 1900. Page 1619 original, 988 print.

24.—Keiser. Curve showing changes in free ammonia, January 24 to October 10, 1900. Page 1631 original, 996 print.

25.—Keiser. Curve showing changes in amount of nitrates found in reservoir. Page 1642 original, 1002 print.

26.—Keiser. Curve showing changes in amount of albuminoid ammonia in reservoir water. Page 1651 original, 1008 print.

27.—Keiser. Curve showing changes in amounts of nitrites at Missouri shore, Chain of Rocks. Page 1664 original, 1018 print.

28.—Keiser. Curve showing changes in amount of nitrites at Illinois shore, Chain of Rocks. Page 1664 original, 1018 print.

29.—Keiser. Curve showing changes in amounts of free ammonia at Missouri shore, Chain of Rocks. Page 1672 original, 1025 print.

30.—Keiser. Curve showing changes in amounts of free ammonia at Illinois shore, Chain of Rocks. Page 1672, original, 1025 print.

31.—Keiser. Curve showing changes in amounts of nitrates, Missouri shore, Chain of Rocks. Page 1682 original, 1030 print.

32.—Keiser. Curve showing amounts of nitrates at Illinois shore, Chain of Rocks. Page 1682 original, 1030 print.

33.—Keiser. Curve of nitrites, Illinois river above Grafton, and above Peoria, showing continuous increase of impurities in Illinois river. Page 1699 original, 1044 print.

34.—Keiser. Curve showing increase of impurities ascending Mississippi to mouth of Illinois. Page 1733 original, 1066 print.

35.—Keiser. Map of Illinois river, Drainage Canal to St. Louis, with averages of the condition of the water before and after the opening of the canal. Page 1756 original, 1079 print.

36.—Keiser. Page 418 from Annual Report of Water Commissioner of St. Louis for year ending April, 1894. Page 2848 original, 1727 print.

37.—Keiser. Twenty-one analyses made from December 15, 1902, to April 20, 1904, in chemical laboratory, Washington University. Page 2849 original, 1727 print.

38.—Keiser. Sanitary water analyses, Missouri river, Fort Bellefontaine. Page 2851 original, 1729 print.

39.—Keiser. Twenty-eight sheets of analyses of water taken in Missouri river and points below the mouth of the Missouri in Mississippi river and at a point above Grafton in the Mississippi and at points in the Illinois river, the Drainage Canal, the Michigan Canal and Lake Michigan in the years 1899, 1900 and 1901. Page 2853 original, 1730 print.

40.—Van Ornum. Chart showing flow of the Drainage Canal and the Illinois river to St. Louis. Page 2934 original and 1779 print.

41.—Van Ornum. Graphic representation of gauge reading of the Mississippi river at Keokuk, Grafton and St. Louis, March, 1903, and at Hermann, Missouri, for that river, same time. Page 2940 original and 1783 print.

42.—Van Ornum. Chart showing gauge readings, March, 1903, Peoria, Beardstown and Grafton, Illinois. Page 2941 original and 1783 print.

43.—Van Ornum. Float used in obtaining flow of river. Page 2947 original and 1787 print.

44.—Van Ornum. Chart No. 116, survey of Mississippi river. Page 3106 original, 1885 print.

45.—Van Ornum. Sixty-eight bottles of water taken by complainant and sent to George Chandler Whipple, originally in three boxes, marked A, B, C; transferred to four packages for shipment. Page 3135 original, 1903 print.

46.—Whipple. Fifteen tables, sub-numbers 46-0 to 46-14, results of microscopic examinations of samples of water contained in complainants's exhibit No. 45. Original page 3165, print, 1922.

47.—Whipple. Seven tables containing results of microscopic examinations of samples contained in complainant's exhibit 45. Page 3190 original, 1937 print.

48.—Whipple. Chart showing graphically turbidity observations made at section I from samples of water contained in exhibit 45. Page 3216 original, 1953 print.

49.—Wipple. Chart showing turbidity examinations at section C. Page 3217 original, 1954 print.

50.—Whipple. Chart showing turbidity observations at section M. Page 3218 original, 1955 print.

Complainant's exhibit No. 1 for identification, containing 117 pages of water analyses made by various witnesses for complainant.

51.—Whipple. Chart showing graphically average amount of nitrites and chlorines at various cross-sections at various dates and per cent of Illinois river water at the cross-sections. Page 3285 original, 1995 print.

52 to 70. Teichmann. Charts used by W. C. Teichmann to illustrate his testimony. Page 4545 original, 2758 print.

71 to 72.—Weather Bureau charts showing annual rainfalls at points given. W. B. Stockman. Page 4740 original, 2874 print.

73.—Stockman. Certified copies of total annual precipitation from records of the Weather Bureau, at points therein indicated. Page 4740 original, 2874 print.

74.—Woodward, W. C. Certified copies of statement showing number of deaths from various diseases therein indicated in the District of Columbia, from January, 1885, to December, 1895. Page 4745 original, 2877 print.

DEFENDANTS' EXHIBITS.

1 to 20 for identification offered by the State of Illinois, being cards attached to samples of water by water takers for the State of Illinois, which said cards were subsequently identified by the witnesses who examined said samples.

1 to 22 for identification offered by the Sanitary District of Chicago, being cards attached to samples of water by water takers for the Sanitary District of Chicago, which said cards were subsequently identified by the witnesses who examined the samples.

23 for identification. Palmer. Page 8582 original, 5306 print. Offered by the State of Illinois, being printed copy of the preliminary report by Arthur W. Palmer, chemical survey of the water supplies of Illinois, also subsequently offered as defendants' Exhibit A.

24 for identification. Palmer. Page 8616 original, 5331 print. Offered by the State of Illinois, being data already offered in evidence, represented on curves.

A for identification. Long. Offered by the State of Illinois, being certain indicated pages of preliminary report to the Illinois Board of Health. Page 6741 original, 4032 print.

A for identification. Palmer. Page 6741 original, 4032 print. Offered by the State of Illinois, identical with Exhibit 23 for identification.

B for identification. Palmer. Page 8736 original, 5397 print. Offered by the State of Illinois, being table representing dissolved oxygen in the Illinois river at Havanna.

C for identification. Palmer. Page 8868 original, 5491 print. Offered by the State of Illinois, being ten sheets containing various tables of monthly averages.

D for identification. Burrill. Page 9250 original, 5728 print Offered by defendants. Photograph of 62 flasks.

E for identification. Burrill. Page 9250 original, 5728 print. Offered by defendants, being photographs of 79 flasks.

1. H. E. Beasley. Page 5827 original, 3505 print, being sewer map of the city of Peoria.

2. Burke. Pages 6847 and 7040 original, 4094 and 4243 print, being cards of water taker on the Kaw river, of Frank C. Burke, water taker on the Kaw river.

3. Long. Page 6879 original and 4113 print, being sample of card used for water takers of the Illinois State Board of Health.

4. Long. Page 6879 original and 4113 print, being sample of shipping envelope used by Prof. Long.

5 to 13. Palmer. Page 8965 original and 5566 print, being charts showing graphically results of chemical data, as indicated on them.

14. Schule. Page 9381 original and 5805 print, being

sample card used by water takers for the collection of samples for the Sanitary District of Chicago.

Jordan's Exhibits A, B, C, pages 9923 and 9925 original, 6194 and 6195 print, being certain typhoid fever plates.

Jordan's Exhibit D. Page 9990 original, 6228 print, being control sack used in the Drainage Canal experiment.

Randolph's Exhibit A. Publication of laws in reference to the Sanitary District of Chicago, published by the Board of Trustees. Page 10723 original, 6625 print.

Randolph's Exhibit B. Page 10763 original, 6649 print, being Sanitary District of Chicago map of the Illinois river watersheds.

Spencer. Page 10917 original, 6734 print.

Complainant's rebuttal Exhibit No. 1 for identification. Page 13101 original, 7942 print. Lockridge. Being transcript made by witness from the mortuary record of the health office of St. Louis.

Defendants' sur-rebuttal exhibit. Page 13160 original, reports of the HealthCommissioner of St. Louis for years indicated. Page 7975 print.

IN THE

1

Supreme Court of the United States

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS
and
THE SANITARY DISTRICT OF CHICAGO.

Original,
Docket No.

Before
FRANK S. BRIGHT,
Commissioner of the Supreme Court of the United States.

Testimony begun at the City Hall, in the City of St. Louis, Missouri, February 17, 1903, at 10 o'clock, a. m., pursuant to an order heretofore entered in said cause.

Present:
THE COMMISSIONER,
ATTORNEY-GEN'L. EDWARD C. CROW,
CHARLES W. BATES, Esq., and
S. B. JEFFRIES, Esq.,
Appearing in behalf of the complainant.
ATTORNEY-GENERAL H. J. HAMLIN,
Appearing in behalf of the State of Illinois.
JUDGE WILLIAM M. SPRINGER, and
J. G. DRENNAN, Esq.,
Appearing in behalf of the Sanitary District of Chicago.

The Commissioner—My Commission is now open and I am ready to hear testimony, pursuant to the rule heretofore entered by the Supreme Court and the notice of Complainant's Solicitors.

Whereupon an adjournment was taken until two o'clock the same day, February 17, 1903.

Met pursuant to adjournment at the same place at two
2 o'clock, p. m., February 17, 1903.

Present, the same parties, and Mr. Alexander Nicholson, also representing complainant.

And thereupon complainant produced Dr. Amand Nicholas Ravold, who was duly sworn by the commissioner.

AMAND NICHOLAS RAVOLD,

a witness called in behalf of the complainant, after being duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION.

By Attorney General Crow,

Q. What is your name?

A. Amand Nicholas Ravold.

Q. Where do you reside, Doctor?

A. St. Louis, Mo., 2806 Morgan street.

Q. What is your profession or occupation?

A. I am a physician.

Q. How long have you been a practicing physician?

A. Since 1881.

Q. Have you ever engaged in any other calling than that of the ordinary business of a practicing physician?

A. Yes, since 1885 I have been a professional bacteriologist.

Q. Well, have you been attached in an educational way to any institution of learning in this city?

3 A. Yes, sir.

Q. What one and in what capacity?

A. I was first connected with the Shaw School of Botany; that was in 1886. I was assistant to Prof. William Trelease at the Washington University. Then in 1887 I became a lecturer on bacteriology in the medical department of Washington University. It was then known as the St. Louis Medical College.

Later I was made Professor of Bacteriology in the medical department of Washington University, and continued so until last year, when I resigned to go abroad.

Q. The Washington University Medical Department and the Missouri Medical have been consolidated, have they not?

A. Yes, the St. Louis Medical College and what is known as the Missouri Medical College have come together, and now form the Medical Department of Washington University.

Q. Do you know when the Missouri Medical College was founded?

A. I do not. Ffty or more years ago.

Q. Do you know when the St. Louis Medical College was organized?

A. I do not. It is a very long time ago, a great many years.

Q. Are you acquainted with the general character and reputation of the medical schools throughout the United States?

A. Yes, I have attended most of them.

4 Q. Do you know in what position relatively the Washington University Medical College stands now with reference to other schools?

A. Yes, sir. It is one of the great schools of the country.

Q. Do you know anything about the number of students that attend there?

A. I do not now. I have not been connected with it for a year, but always a large number.

Q. At the time you ceased your connection with it?

A. I resigned last year.

Q. At that time about what number were there?

A. Oh, it always varied. It would depend upon the class, from 30 to 60 or 70 men in a class, and they take four years, so it would be about four times that many.

Q. That is, in the medical department?

A. Yes sir.

A. They have a four years course?

A. Yes sir.

Q. Any preparatory work before entering college?

A. In the medical schools?

Q. Yes.

A. O yes indeed. A man has to—I think he must pass through the high school and a certain amount of preliminary training in a college, but just what that is I don't know.

5 Q. Do you mean preliminary medical training?

A. No sir, not before he begins.

Q. Now what was the first work you say you did as a bacteriologist with the Shaw school?

A. At the Shaw school of botany.

Q. Now where is that located?

A. It is connected with the Washington University.

Q. Where is it located?

A. It was then between 17th and 18th streets on Washington avenue. It is now in the Missouri Botanical Garden. It is out at the Shaw Garden.

Q. It is maintained now as a public garden, is it, a botanical garden?

A. The botanical garden is maintained as a public garden. It was given by Mr. Shaw to the city.

Q. Is there any institution, any botanical institution connected with it?

A. Is there what?

Q. Is there ay botanical institution run in connection with the garden?

A. Yes, it is a school of botany. That is part of the university.

Q. It is now conducted out there?

A. I think part of it goes on out there, part is there and
6 part in the university proper down town.

Q. It is all connected with the Washington University?

A. Yes sir.

Q. Now what was the character of your work with the Shaw school?

A. In the beginning I had the ordinary technical training of bacteriologists, which they go through. The salad days, I suppose you would speak of it, learning how to clean a test tube, and how to make soup for bacteria, and growing bacteria, and such things, and distinguishing between the different kinds of bacteria, that is the pathogenic and non-pathogenic bacteria.

That was during the first year. The second year I taught that to the students in that institution.

Q. Now wait a minute. Before you proceed any further I want to get you to explain some terms. You spoke of making soup for bacteria. Explain the method of making that and the object of it.

A. Well, in order to have the bacteria grow and multiply they have to be fed; and to feed them you have to give them food that they like best, that they can live on best. And it has been discovered after years of labor that certain nitrogenous compounds put in assimilable form at the proper temperature for them encourages them to grow and multiply, and a variety of media are used for that purpose. In the beginning various soups are made out of vegetable or animal products. Now following
7 the method laid down by the American Public Health Association, of the bacteriological department of which I am a member, we have regular rules for making media, and the definite reaction that must be in the media. That has all been worked up carefully by a body of experts.

Q. Will you explain what you learned there about the making of what you call soup for the bacteria, what the process was at that time?

A. You want to know the way we made soup then?

Q. Yes.

A. Well, we took a pound of lean beef free of fat, and put upon it a litre of water, and that was allowed to stand in an ice chest over night. In the morning that was squeezed through a sieve, and filtered and cooked, and to it was added a certain amount of peptone, that is a digested meat product. This mixture was boiled, filtered, and when perfectly cooled it was sterilized. That was a stock product. That was the beginning of all media of a certain kind, and to that was added if we cared to have solid medium, a definite per cent of gelatine, ten or twelve per cent., or a Japanese seaweed known as ager ager.

Q. Now one or two per cent. of ager ager was added to it?

A. That is a so-called solid medium, that is, gelatine and the ager ager, and we will speak of that as solid media right straight along. Those practically are the fundamental food pro-

8 ducts that we use. The gelatine and the ager ager are solid media; then there are various special media. We use the potato; we use milk, and then we have various special media that are made up for certain classes of work that are to be carried through. There are a large variety.

Q. Now I want to get another thing into the record before we go any further. You used a term a while ago that indicated that bacteria in one form was injurious and in one not injurious. Give those terms to me.

A. I said pathogenic. A non-pathogenic organism is one that does no harm to an animal, while a pathogenic organism is one that lives in his tissue and does him harm.

Q. Now will you go on and explain what were the next steps in your bacteriological experience?

A. I was employed by the St. Louis Medical College, that is, the medical department of the Washington University, and taught bacteriology from the last part of September until April or May of each year.

Q. Now what year did you begin there?

A. I began in 1887, and later, as I say, I was made professor, but still continued in that work. In 1894 I was employed by the St. Louis health department—

Q. The city government?

9 A. The city government, yes sir, to aid in the bacteriological work of the health department. I was an employe and my title was consulting bacteriologist. I then made bacterial culture experiments, and did any work of that kind that came in; I carried out experiments for the department working on tuberculosis, diphtheria, typhoid, blood and various things that came up at that time, and made diphtheria anti-toxin.

MR. DRENNAN: That was in 1894?

A. In 1894 I began.

MR. CROW: Still retaining your connection with the college?

A. Yes sir; I worked four or five hours a day right straight along.

Q. During that time you have also been in practice?

A. Yes sir.

Q. Not in the general practice, but more as a specialist?

A. Office practice.

Q. What do you mean by that?

A. Genito-urinary work, diseases of the privates, venerial diseases and things of that kind.

Q. Now doctor, what does the term bacteriology in the medical world mean?

A. It means the study of bacteria.

Q. Now what do you mean by bacteria?

A. Bacteria are the lowest forms of vegetable life. They
10 are closely allied to the algae. They belong to the group
thallophyta, and come in the division known as schizomycetes or fission fungi.

Q. Now where are they found?

A. They are found everywhere on earth, on the surface of the earth, more or less on the surface or in the earth, in the waters of the earth and in the air close to it, even extending up to some height, as high as they can go, as high as the currents of the air will carry them above the earth's surface.

Q. As high as the currents of air above the earth's surface?

A. Yes sir.

Q. Now you are familiar with the origin and development of this particular branch of science, are you?

A. Yes sir, I have been watching it since 1881.

Q. Making it a study?

A. I did some microscopical work in 1881, but I didn't really take hold of that subject, of bacteria, with serious interest and vigor until 1885.

Q. Well, from that period to this period, 18 years, you have made it the principal study of your scientific researches?

A. Yes sir.

Q. Now will you please tell me if you know who first discovered the existence of vegetable organism known as bacteria?

A. Well, that credit is given to Anthony von Leeuven-
11 hork, a Dutchman of Delf, Holland. He is the so-called
father of microscopy. He succeeded in making a magnifying lens powerful enough to see micro-organism floating about in various fluids, in water from street gutters, in his own urine

and in spittle and things of that kind, and to see minute organisms floating about in these fluids. He drew pictures of them and made drawings of them and described objectively what he saw. Those are still in existence.

Q. Now about what date was that?

A. 1675.

Q. What was the business of this man?

A. He was a linen draper, I believe, a man somewhat interested in scientific pursuits, especially in lens grinding, and he saw these things.

Q. That is the first recorded instance in which these organisms were identified?

A. Yes. Another man by the name of Kepner, in 1671, is also credited with having seen these minute organisms in fluids. Also as the powers of the microscope were increased and as better microscopes were made, and the chromatism overcome, that is, the irregular lighting or prismatic display of colors in the old microscopic lenses, after that was overcome pretty well, minute organisms began to be studied and from that time up until the time of Pollander and Davaine very little was done. These men, however, discovered in the blood of an animal dead,
or an animal sick with the disease known as anthrax, a
12 micro-organism.

Q. When was that?

A. In 1849.

Q. Where did these men live, in what country?

A. Germany and France. Davaine was a French physician. He also in 1850 saw the bacillus in the blood of an animal, and in 1863 succeeded in giving a well animal the disease anthrax, by taking the blood from a diseased animal and putting it into a well animal.

Q. Explain to us what anthrax means, so that we may get it into the record.

A. It is a disease of cattle, produced by these micro-organisms called anthrax bacilli.

Q. What is the outward appearance of the disease and what effect does it have?

A. An animal affected with that disease—if it is injected into the skin, you understand—at the site of the injection there is an induration, or hardness and swelling; that swelling extends to the whole body and the animal sometimes dies in convulsions or just simply lies over and dies with a gigantic struggle for breath.

Q. Well, are there any eruptions on the skin?

A. Yes sir, sometimes.

13 Q. How does it develop in man?

A. It produces a malignant carbuncle in man. The disease is known as malignant carbuncle. If the bacillus gets into the tissues, in the skin or mucous membrane, it produces this disease anthrax. On the outside of the body it produces a little pimple and a great deal of swelling follows an induration, hardness, and the swelling spreads rapidly like erysipelas. This is followed by fever, profound poisoning and rapid death. There are two forms in man, what is known as the local form of the disease, in which it remains localized, and can be cured, but the other in which the disease enters into the blood and the bacillus circulates in the blood, death invariably follows it, and this is the disease of the blood in which bacillus was first discovered in 1849.

Q. What was the next step?

A. Well, it was claimed by Davaine in 1863 that this microorganism was the thing that caused the disease, this rod that was found in the blood was declared to be the cause of the disease.

Q. What was this rod?

A. This rod was the bacillus of anthrax. During all this time the question of spontaneous generation had been coming up and had been fought over savagely by scientists on both sides. Going back as far as we can go in literature we have accounts of spontaneous generation, things coming out of nothing, or growing from nothing. But Plenciz, in 1749, announced the doctrine with a good deal of vigor. It was combatted by a number of men, especially by Spallanzani, an Italian, and he
14 claimed that by putting fluids in hermetically sealed vessels and cooking them, that he could prevent spontaneous generation in these fluids, and he denied the doctrine of spon-

taneous generation. He further showed that when this sterilized material in flasks, if the air was allowed to gain entrance to it through a crack, made in the flask, that immediately growth occurred in this medium, demonstrating to his mind that the thing that grew in the medium must enter with the air that entered the crack. Of course it was combatted in a variety of philosophical and metaphysical speculations until it was finally proved that the doctrine of spontaneous generation rested on false premises, that there could be no life if there had been no previous life. That is, you cannot have life in a fluid unless the fluid had contained some living thing.

Q. Now this Frenchman, who in 1863 made the statement that this rod shaped bacillus caused anthrax, did he make any experiments demonstrating his theory?

A. Yes, he did, but he was unable to separate out these micro-organisms into what we call pure culture.

Q. Just explain what pure culture is, because the term will be used throughout the investigation, as far as bacteria is concerned.

A. Pure culture means that a micro-organism, say anthrax bacilli, are separated out and made to grow alone in the medium,
or upon the medium. It is free of every other micro-or-
15 ganism, it is a pure culture and if it is not free of every
other micro-organism, it is impure culture.

Q. Explain his failure to demonstrate this fact, and what was the next step in the history of the science?

A. Now comes in the work of Pasteur.

Q. That is the French physician?

A. The great French scientist.

Q. That treated rabies?

A. Yes sir, Pasteur, who had been working on the question of spontaneous generation and fermentation. Swan, immediately before, in 1854, after it was demonstrated that the cause of fermentation in certain kinds of fluids was due to a micro-organisms, an yeast cell called saccharomyces cerevisiae. Swan showed that this micro-organism was the probable cause of fermentation, and Pasteur took it up and cleared up the whole subject.

Q. When did he begin his investigation?

A. He began his investigation before 1860—he was a chemist then and took up the question of spontaneous generation, or rather, fermentation, in opposition to Levbig, and demonstrated very clearly that micro-organisms yeast cells were the cause of fermentation, and it resulted in the better production of wines and beers and whiskey and alcohol. That is from the industrial side. He later became interested in disease and took up the study of various diseases.

16 Q. Now let me ask you a question right there. Prior to 1849, had there been any demonstration in the scientific world that showed that bacilli had any particular relation to diseases of the human body?

A. No sir.

Q. That first developed along about 1849 or 1850?

A. Yes sir.

Q. Now go ahead.

A. Now, Pasteur began separating out these yeast cells of which we spoke in pure culture, and his method of working was exquisitely minute and tedious. It is difficult to believe now that he ever succeeded in getting any kind of bacteria separated out in pure culture with his method.

Q. What was that method?

A. It was simply a transfer from one broth culture to another, material that was to be studied. There were a series of test tubes aranged along in a line containing soup made in some one of the various ways in which we make soup. The medium in these tubes was all thoroughly sterilized. Everything in them was dead, no life in them. Now say it was an yeast cell he wished to separate out. He began by taking a little yeast and mixing it into tube Number 1, then from tube Number 1 to tube Number 2, then to tube Number 3, then to tube Number 4,—in that way finally hoping that he could take out a drop from one of these later tubes that would have one micro-organism in one drop. Now if he did succeed in separating it out until
17 he had one or two micro-organisms to a drop then he
had little trouble in separating them from one another.
In that way, a vastly tedious way, he succeeded in separating out

quite a number of micro-organisms from one another. As a result of his work he succeeded in separating out the micro-organism which caused fermentation in urine.

Q. That was in 1868?

A. Yes sir. In 1868 or 1866, Lister's attention was called to Pasteur's work. He was an Englishman, an English surgeon, and he reasoned that if bacteria did not exist in the blood proper but could exist on and in the skin and in the air, that it would not be difficult to keep them out of a wound, and prevent fermentation in a wound. His tests were followed by success and that is how we treat wounds today. This is the basis of our asceptic surgery of today. He said if these micro-organisms caused fermentation in fluids outside of the body they must cause fermentation in wounds, and if we keep them out of the wound, the wound won't ferment. That is what that Listerism means. It means washing and cleaning carefully the wound and keeping out micro-organisms.

Q. He demonstrated that bacilli would ferment a wound?

A. Yes sir.

Q. The same as they ferment wine or urine?

A. Yes sir.

Q. Now was it Pasteur that first classified bacteria?

18 A. No sir.

Q. Now go ahead with Pasteur's experiments.

A. Pasteur then continued his work, and he began one of his earliest pieces of work in the study of disease. It was the silkworm disease. He was employed by the French government to find the cause of the death or disease in the silkworm. He succeeded in cleaning that up before 1860, showing the cause of the disease of the silkworm was due to a certain living thing. That was his first piece of work. He demonstrated clearly that a micro-organism was the cause of a disease in an animal,

Q. And that animal was the silkworm?

A. Yes sir.

Q. And he demonstrated there was a certain bacillus that caused that disease in the silkworm?

A. Yes sir.

Q. That is the first known instance where Pasteur demonstrated disease was traced directly as caused by a micro-organism?

A. Yes sir, that was the first one. Then he followed that up with work on the chicken cholera. Later upon hog erysipelas. Then he took up the question of rabies or mad dog bite, or hydrophobia, and not only studied the subject very carefully, but produced a cure for it. He then took up the question of anthrax, and produced, or rather invented a method of preventing
19 the disease—the so-called inoculating method.

Q. Similar to the smallpox virus?

A. Somewhat, yes sir. The idea of this method of his is to give the animal a first dose of an attenuated form of the micro-organism, and then afterwards giving it a strong dose of the virus, or a second dose of the growth of the bacillus, and finally it is given a highly virulent organism and in that way the animal is protected. In other words, the animal is encouraged to manufacture within its own tissues anti-toxins that are antagonistic to the toxins of the micro-organism.

Q. What did those experiments with reference to rabies demonstrate?

A. He demonstrated that he had a cure.

Q. Did he demonstrate the cause of it?

A. It never has been found.

Q. The cause of rabies?

A. It was probably too small to see. That is, to see with our present high power lenses.

Q. Is it known as the absolute cause of rabies?

A. No sir.

Q. Then the origin of rabies is unknown?

A. Yes, unknown.

20 Q. But the cure for it is what?

A. This Pasteur method.

Q. What does that consist of?

A. That consists in giving the individual or animal a dose of attenuated virus first, the so-called attenuated virus I spoke of. I worked in the Pasteur Institute for quite a little while, watching this work go on, and I remember the details very well, and if you care to hear it I will tell you. It is hardly bacteriological.

Q. What is that virus made of?

A. It is made of the spinal cord of rabbits.

Q. What was the next work of M. Pasteur?

A. Other bacteriologists were working, and one of the great discoveries that comes in here on the question of spontaneous generation was made when Spallanzani showed that by sterilizing fluids in hermetically sealed vessels growth would occur in the fluids. Then Swan showed that by heating air as it passed through a long tube before passing over a fluid, that no growth would occur in the fluid.

Q. Over the sterilized fiuid?

A. Yes sir. And next Schroeter and Van Dusch plugged the vessel with a cotton stopper and this is one of the greatest discoveries in bacteriology.

Q. When was that?

21 A. That was, I think, in 1854. I am not positive about that date. Now these cotton stoppered flasks containing steril fluids were used in growing and separating out bacteria in pure cultures, until we come to Koch, his work, begins in 1876.

Q. Who was he and where was he located?

A. He was a German, and where he was located I don't know, at the time that he began work. I think it was in Göettingen.

Q. That is in Germany?

A. Yes sir.

Q. Working in one of the German cities?

A. He began his work on anthrax?

Q. Is he still working or dead?

A. He is at work.

Q. Now what time did he begin on anthrax?

A. 1876 and 1878, and published his work on traumatic diseases in 1880.

Q. What is that?

22 A. Traumatic disease—that is diseases of wounds. He brought a scientific mind to bear upon the whole question

of suppuration in wounds, and what caused it. Lister's work before that had already robbed surgery of some of its terrors had advanced the science of surgery immensely, to almost its present condition, but Koch's work improved it so much that most any man can now become a surgeon.

Now his work on traumatic diseases I think came in 1878, and later, in 1880 he did his work upon anthrax, upon the spores of anthrax. In 1881 or 1882 he pronounced his discovery of the bacillus of tuberculosis, and in 1884, in conjunction with Eberth announced the discovery of the typhoid fever bacillus.

Q. What was his nationality?

A. He was a German.

Q. Was that the first discovery of the typhoid fever bacilli?

A. Yes. It was discovered in the tissue. It was afterwards separated out in pure culture, and developed by Klebs, and known as the Klebs-Eberth bacillus. In 1884 and 1885 he discovered the cause of cholera.

Q. Was that a bacillus?

A. It is a spirellum.

23 Q. That is a form of bacillus?

A. Yes sir.

Q. Is it in the form of a spiral?

A. Yes, sir, and it takes its name from the form of it.

Q. And it takes its name from the form of it?

A. From the spiral form in which it grows, and it is also known as the come-bacillus. The second great discovery in bacteriology, and the great advance in the science of bacteriology dates from the discovery by Koch in 1881, of what is known as the solid medium. Heretofore, as I told you, bacteria were grown in fluids, but Koch came along and demonstrated to bacteriologists that bacteria could be grown on solid media as well as in fluids. I suppose there is no use going into the history of the how or why of this thing, but the fact occurred to me—

Q. Just give the story as science gives it.

A. The story is this, that a piece of moist bread upon a table had been lying there for quite a little while, and was noted by this scientist. He saw upon the surface of the bread, but separated from one another, that various moulds had grown.

Where the spore fell on the bread it grew and formed a colony. It occurred to his mind at once, the thing to do was to make other bacteria grow, if they would grow, where they fell, and form a colony, he simply added gelatine or ager ager to soup and he had a solid medium. Now then, when a micro-organism
24 was put into this solid medium, and grew, a colony formed which could be seen first with a low power lens, and later with the unaided eye. Ten per cent gelatine medium liquefies at 30 centigrade. If we take this liquefied medium not too hot, and put into it, say pus from a wound, and then the medium is poured out on a sterilized plate in a thin layer, wherever the micro-organism is fastened, when the medium cools, there it stays. And inasmuch as it multiplies rapidly in a favorable temperature, one becomes two, and two becomes four, and so in that way in a little while a good many grow, to form what we call a colony. Although bacteria are exquisitely small when alone, in bunches they form colonies large enough to be seen. Thus one isolated colony, of a particular bacterium forms a pure culture and can be very quickly separated out. We may have ten or fifteen distinct micro-organisms in a fluid, but when spread out in a solid medium on a glass plate, or in a Petrie dish, the micro-organisms can all be separated out very easily from one another and grown in pure culture. This is the solid medium method of Koch. Well, dating from this discovery, bacteriology has become a science, because it will allow the merest tyro in bacteriology to begin work and separate out bacteria in pure culture.

Q. That was in the year 1880?

25 A. In 1880, yes sir.

Q. Now along what lines did he pursue his investigations of bacteria?

A. I have given you that. He worked on various micro-organisms; he followed up this work by going further, not only discovering the particular micro-organism which caused a particular disease, but studied micro-organisms in their action upon the body tissues. The toxins produced by bacteria and their action upon the body tissues. Some micro-organisms produce a poison which resembles somewhat rattlesnake poison. Many others of these toxins, of different characters, such as Diphtheria and Tetanus, were studied by Koch. Like Pasteur, his practical mind led him to try and produce cures as well as discover the causes of disease. Among his first efforts we have Koch's lymph, which we have all heard so much about, the so-called cure for tuberculosis.

Q. He first identified the typhoid bacilli in 1884?

A. He and Eberth.

Q. Now is there a diphtheria bacillus?

A. Yes. It was discovered in 1884, by Leoffler, a German.

Q. The cure for that has been discovered also?

A. Yes sir, that came later. Work began upon it in 1891.

Q. In what way is the anti-toxin manufactured that is used for diphtheria bacillus?

A. It is manufactured all over the world.

Q. I say in what way?

A. Do you want the method of producing diphtheria anti-toxin?

Q. Yes, how do you produce it?

26 A. Now the first thing that is done is this. The first movement is to get a diphtheria bacillus that is virulent, one that will kill, kill an animal.

JUDGE SPRINGER: That is, you mean, an organism of a particular disease?

A. Mr. Crow wants to know about the manufacture of anti-toxin for diphtheria that he is speaking of, and if we speak of the method of production of the anti-toxin of diphtheria we will cover all anti-toxins. We will have to go into that later, so perhaps it would be better to go into it now. The first thing to do, as I said, is to take a highly virulent micro-organism, a diphtheria bacillus that will kill an animal quickly, and of all the virulent diphtheria bacilli that have been found in the world, the one that is most virulent, was found by Dr. Park of the New York health department. This is known as Park's bacillus No. 8. Now that micro-organism is taken and put in a soup, a special kind of broth. That broth is made up so that its reaction is 1.5 per cent acid, to phenolphthalein from the meat of beef—

best old beef—from which the muscle sugar has been removed. This muscle sugar can be taken out, be broken up, with bacillus coli communis, so that the sugar which existed at first, in the beef, can be gotten rid of by the colon bacillus. Now a broth is
made of this beef free of muscle sugar, and its reaction
27 must be 1.5 acid to phenolphthalein, or neutral to litmus.

This broth is put into large flasks, flasks containing from 800 to 1000 cubic centimeters, sterilized, and into that is sown a virulent pure culture of Park's No. 8. The flask is now put into an incubator and kept at body temperature, say 36 1-2° centigrade, and grown from 5 to 10 days. At the end of that time it is taken out, tricresol or carbolic acid in a small percentage, one-half per cent as a rule, added. The idea of adding tricresol or carbolic acid is to keep other micro-organisms from growing in it when it is exposed, and also kill the diphtheria bacilli which are there. It is allowed to stand for a little while and then filtered through an ordinary paper filter, and then afterwards filtered through a Pasteur filter, or a Birkefeld filter. Now we have soup containing the toxins produced by the diphtheria bacillus. We are now ready to find out what is the effect of this broth, how many drops of it will kill a guinea pig weighing a definite number of grams. We take a guinea pig weighing 300 grams, and inject into it a definite amount of this material. The idea is to have a toxin of which 1-100 cubic centi-
meter will kill a guinea pig weighing 300 grams in from
28 three to five days. When this strong it is called a good
toxin. Now with this good toxin—strong toxin, we begin injecting a horse, the horse must be a strong, vigorous animal, about 6 years old, used to hard work and free from disease, free from kidney diease especially, free from tuberculosis, and free from glanders. Having a good strong horse the hair is shaved off over an area in which to inject the broth with a steril syringe a small amount of this material, half a cubic centimeter, say four or five drops, to begin with, are injected under the skin. This makes the horse quite sick. At the point of the injection it first produces a hardness, then a swelling wide in area. The temperature of the horse rises within 24 hours, and goes up to 104° or 105° Fahrenheit, the normal temperature of the horse

being 99°. That temperature continues to fluctuate running as high as 105° and 106° for 4 days then drops to the normal on the 5th or 6th day. The sixth day it rises again, and then drops to normal at the end of the 6 days, and remains so. At the end of ten days or two weeks another injection is given of this same poison, twice as large as the first injection, ten drops. The horse is again made sick in the same way; has its high temperature recorded; on the 5th day the temperature reaches normal; then runs up again, and at the end of the 6th day, normal, and then the horse practically retains his normal temperature. At the end of ten days or two weeks, he is given another dose twice as large—20 drops, and so we increase it gradually, watching the horse to see if he loses weight
29 or refuses his food. The doses are either decreased in quantity or made larger, and in that way the horse is finally given an enormous quantity of this toxin, as high as a quart of this virulent toxin can be given to a horse, if he is properly prepared for it. After a time, say two or three months, the horse is bled. He is bled by shaving an area over the jugular vein, and with all aseptic precautions imaginable the blood is drawn from that vein into a sterilized flask. The blood is allowed to stand, and as a result of this standing, the blood clots, the blood serum—the water of the blood separates from the blood corpuscles and fibrin then results from the clotting. The serum is poured off and to it a small quantity of tricresol is added—5-10 per cent, to protect it. Now then we test the serum to ascertain its anti-toxic potency, how many units of anti-toxin it contains, and this is done by now going back again to our original toxin and finding out exactly what is the minimum lethal dose, or smallest dose that will actually kill a guinea pig weighing 300 grams, say that is 1-100 of a drop. Now then, we take ten times that much. We find 1-100 of a drop will kill a guinea pig weighing 300 grams in from three to five days. Now take ten times that amount, which is 10-100 or 1-10 of a
30 drop, and we mix it with a small quantity of this blood serum, or anti-toxin, as we know it, and we inject them together into a series of animals using smaller and smaller quantities of our anti-toxin. In this way we reach the point

where a certain amount of anti-toxin will prevent the death of a guniea pig, and the smallest amount of anti-toxin that will keep a quinea pig from dying when injected with ten times a minimum lethal dose of that toxin, is 1-10 of a unit, or in other words, ten times the amount of anti-toxin that will keep a guinea pig from dying when injected with ten times the minimum lethal dose of toxin is an anti-toxin unit, and our anti-toxins now contain anywhere from 100 to as high—I saw one sample of anti-toxin which contained 2000 units to the cubic centimeter—it is very good anti-toxin when it contains 500 units to the cubic centimeter. Now for the cure of diphtheria, this is the anti-toxin which is used both for the cure and prevention of diphtheria. When a case of diphtheria breaks out in a household, the rest of the household can be inoculated with a minute dose of anti-toxin and be protected for a short while. For the cure of it we inject from 1500 to 3000 units, depending on the severity of the case. It is a specific cure for diphtheria.

Q. Now what other disease has the science of bacteriology traced up as originating in bacteria, since the time you mention of Koch's discovery?

A. Well, we have first of all, infectious wound diseases.
31 Ogsten, an Englishman, in studying these diseases—saw Micrococci in the pus from wounds, but did not separate them out in pure culture. Then Obermeir, a German, who found in relapsing fever a spirillum in 1879, Spirillum Obermeieri.

Q. That is a form of bacilli?

A. Yes sir. That was in 1879, and it is known as the spirillum of Obermeir. Then another German Fehleisen, discovered the cause of erysipelas in 1879, and the cause of gonorrhea was discovered by Neisser in 1879.

Q. What were those specific causes?

A. Gonococcus was the cause of gonorrhea, that was the discovery by Neisser, a German.

Q. That was a bacillus?

A. No, it belongs to the family of bacteria, but it is a micrococcus. The cause of erysipelas is known as the streptococcus-erysipelatis.

Q. That is a micro-organism?

A. Yes, it belongs to the coccus group. Then Ogsten in working in 1880 on pus, saw quite a number of different forms of micro-cocci in pus and he named them the streptococcus resembling a chain, staphylococcus taking the form of a bunch of grapes, and later they were separated out in pure culture by Rosenbach, and given the scientific names which they now bear.

We have in this septic group the staphylococcus—pyo-
32 genes aureus, the staphyloccus pyogenes albus, the staphy-
lococcus pyogenes citreus, and the streptococcus pyogenes, and the sterptococcus of erysipelas. The strepococcus pyogenes produces septicemia. Quite a number of micro-organisms were found to produce supuration in wounds, and the method of keeping them out of wounds I have spoken of, which accounts for the wonderful advance in surgery. I spoke about the discovery of Koch in 1881, the cause of tuberculosis; then we have glanders discovered in 1884, typhoid fever in 1885, and then the bacilli coli communis separated out by Emmerich in 1884. Pfeiffer and Canon discovered the cause of la grippe.

Q. What was that?

A. That was a bacillus. In 1894, we have the work of Kitasoto. He discovered the bubonic plague bacillus.

Q. Who was he?

A. He was a Jap.

Q. A Japanese?

A. Yes sir, and in 1898, we had the discovery of the cause of dysentery by Shega.

Q. Who was he?

A. He was another Jap. He discovered the cause of dysentery.

Q. What was that cause?

33 A. The Shega bacillus.

Q. A form of bacteria?

A. Yes sir. That practically covers the field of bacteria of infectious diseases.

Q. No discoveries in 1890, and 1891?

A. No, nothing new in pathogenic micro-organisms. Then began the work on anti-toxin in 1891. Wernicke and Kitasoto whom I spoke of, and the others, began work on anti-toxins.

Q. You said that these micro-organisms known as bacteria in general terms, were found in the air and water and in the soil?

A. Yes sir.

Q. Now some of them are water born and others are not?

A. Yes sir.

Q. Will you tell us what of them are water born?

A. Well, most of the bacteria can be water born for a short distance, but many of them die—very many—in water. The water born diseases as we know them are typhoid fever, the cholera and dysentery.

Q. That is dysentery?

A. Yes sir, but as I said, most bacteria can be carried and
34 live for a short distance, anthrax, for instance.

Q. Now most of the other bacteria are in the soil or in the air or both?

A. Yes sir.

Q. Now what, if any, relation do bacteria bear to life—animal life and vegetable life, and its growth and development, and its decay and its rehabilitation in different forms, in animal and vegetable matter, and so on?

A. There would be no life on earth without bacteria, consequently they are the undertakers of the organic world.

Q. Now what do you mean by that, when you say undertakers?

A. I mean this, that when an animal dies or a tree falls, in a short while, as we know, that material begins to break down, after it lies awhile we see that it gradually disappears, breaks apart and finally disappears, and so with an animal dead upon the field. It swells up and stinks for a while and then disappears, leaving nothing but bones. Now the cause of the disappearance of a tree and the meat of a dog or dead animal, are the result of a destructive action of the bacteria upon the chemical compounds that compose the structure, the heterogeneous structure of that animal. They reduce, in other words, the highly complex nitrogeneous compounds and carbon compounds to the
35 lower forms of carbon, hydrogen, oxygen and nitrogen.

Q. Those are the four basic forms of animal and vegetable life?

A. Yes, those heterogeneous molecules are broken up so that in the end we have ammonia and carbon dioxide as a result. The carbon dioxide passes off in the air. Ultimately these complex heterogeneous structures are reduced to the elements from which they came. These simple compounds form the food for the plants again, and the plants take up this broken material, and grow. Plants are food for animals, hence animals upon earth; so that without bacteria there wuold be no life upon earth. They are also the destroyers of the organic world.

Q. Well then, scientifically and practically speaking, you mean to say that bacteria are both economic and industrious?

A. Yes, sir.

Q. One equally with the other?

A. Yes, sir.

Q. Now just carrying out that thought of economy and industry that bacteria occupies in the scientific world and in the practical world, what relations, if any, exist between bacteria and the production and manufacture and consumption of food of the human race?

A. Yes, indeed they do. They are very closely asso-
36 ciated with life in that way. For instance, they bring
about the souring of milk and the cheese that results from it, that is a food product which they produce.

Q. Now wait a minute. Is that souring of milk an artificial process or a natural one?

A. It is a natural process produced by the micro-organisms that grow in milk. They produce acids which sour and some of them produce a substance like rennet, which coagulates the milk at once without souring it.

Q. That would take place in the open air in a state of nature?

A. Yes, sir. And that cheese becomes food, from the cottage cheese up to the elaborate cheeses of the Germans. The ripening of the cream and the production of butter, and especially good butter, the butter flavor that we know, rich butter flavor, is produced by Cohn's bacillus No. 41.

Q. What is that?

A. That is a micro-organism. A bacillus which was separated out by Mr. Cohn of the Wesley Institute or University. Cohn's No. 41, and gives its flavor to butter. It is now manufactured by him or his people, and sent to dairies all over the United States, and I believe is sent all over the world.

Q. Who purchase it and consume it?

37. A. The dairies, the great dairy interests of the whole country use it constantly every day.

Q. What is the effect of that on the butter?

A. It has no deleterious effect, but produces from the oil and the sugar an aromatic odor, the so-called flavor of butter.

Q. Has it any beneficial effect on the butter?

A. It makes it beneficial. It makes it butter, better tasting, consequently easily digested, largely consumed, more readily sold, and thus a higher priced product.

Q. Then, this operation of the bacilli on the fatty matter of the butter is what causes that aromatic odor?

A. Yes, in the cream. Bacteria destroy sewage, for instance. That is, sewage in a tank is destroyed by them.

Q. Now what is it the septic tank produces?

A. It consists in running sewage, crude sewage, into tanks heremetically sealed, and the bacteria there being of two kinds, aerobic and anaerobic, break up the organic compounds of the sewage.

Q. You are using sewage in the technical sense?

A. Yes, sir, crude sewage.

Q. Do you know what percentage of ammonia and alcolines sewage in water contain?

A. No, sir, it doesn't make any difference whether it is
38 diluted or concentrated sewage. It is run into these practically heremetically sealed tanks. The idea is this, the aerobic micro-organisms act upon the sewage, first working in the presence of the oxygen of the air in the sewage; so soon as the available oxygen is used up, the aerobic bacteria cease their destructive action on the sewage which gives the anaerobic bacteria which flourish best in the absence of oxygen a chance to attack the organic compounds in the sewage. The result of the destructive action of these two kinds of bacteria on the sewage it to quickly liquify the solid organic materials and to reduce them to lower and lower nitrogeneous and carbonaceous com-

pounds. Ultimately ammonia, carbon dioxide, hydrogen and marsh gas are produced, which are gases and lower forms of nitrogen and carbon compounds which are food for plants.

Q. Have you ever seen any of these septic tanks?

A. Yes, sir.

Q. How are they arranged?

A. I have one at work in my cottage in the north. It works during the whole summer, and it works in the way I spoke of it.

Q. How is it constructed?

39. A. This particular one is a tank in the ground made of brick and the sewage runs into it. It is underneath the ground, and the bacteria do the work upon excreta as thrown into it, the sewage in it rises to a definite height, and remains in it until flushing carries out the liquefied material by siphonage into a field.

Q. Are those bacteria present in all sewage mostly?

A. Yes sir.

Q. Now are the different forms of bacteria necessary to the proper and successful culture of the soil?

A. Yes, sir, for the proper destruction of some of these materials it is necessary to have a certain class of non-pathogenic bacteria, they fertilize the soil. In fact, they are sown upon the soil in some agricultural regions in pure cultures.

Q. Now in the bacteriological world the injurious and non-injurious bacteria exist in about what proportion?

A. How do you mean?

Q. That is, in greater numbers. Are the bacteria that are non-injurious in greater numbers in the water, air and soil, than the others, in the human system?

A. An enormous number of bacteria in the world are beneficial, and a great number of them are harmless. There is only an occasional one that is harmful.

Q. What do you call the bacteria that is found in the
40 water, and that is found in the water fed by sewage, and is found in the stomach of animals, including man—or rather in the intestinal canal?

A. The one that has been looked upon as the index of fecal pollution? That one is called bacillus coli communis.

Q. What do you mean by fecal pollution, Doctor?

A. Whenever the discharge is from the intestinal canal of man or animal—

Q. But it has always been supposed that these bacilli or bacteria would be found there and nowhere else?

A. Whenever there is sewage from man or animals, the bacillus coli communis is generally found present.

Q. They are also found in discharges from man or animals on the soil or anywhere else?

A. Yes sir.

Q. Now have you discovered any other place where they exist?

A. In some of our work we found that it does not exist in the intestinal canal of fish in the ordinary streams, but in the fish of the Illinois river it exists in very large numbers in the intestinal canal—in about 70 per cent. of the fish. In the fish in ordinary streams it dosn't exist, but in the highly polluted
water of the Illinois river we found the bacillus coli com-
41 munis in the intestinal contents of the fish taken from that
river. I am stating from memory, I don't know exactly; I think it is about 69 or 70 per cent. of the fish in that stream which we studied. I think we studied 68 fish of five or six varieties or more.

Q. Now going back to the discovery in 1884 by Koch and Eberth of the typhoid bacilli, do you know in what way they discovered that, or in what animal and in what portion of the animal?

A. They discovered it in the intestinal contents, or rather in the intestinal mucous membrane and glands of a man dead of the disease.

Q. Dead of the typhoid disease?

A. Yes sir. In cutting sections and staining them and studying them from the intestinal contents, the intestinal walls, rather, they discovered in the tissues bunches of short bacilli which they described and also photographed. Koch photographed them. This was supposed to be the cause of typhoid fever, inasmuch as it was found in no other intestinal disease, but later Klebs found it not only in the intestinal contents and the intestinal glands of people dead of the disease, but also in

the spleen and in the blood, and he separated it out into pure culture and described very carefully its cultural characteristics, the way in which it can be distinguished from other micro-
42 organisms. Later work on this bacillus has shown that it is very probably the true cause of the disease. It is found in the intestinal contents, and in the mucous membrane of the intestines. It is found in the spleen and other organs. It is found in the blood, circulating in the blood, and is discharged from the body in the intestinal contents, and also with the urine, in enormous numbers, at about the beginning, or rather, towards the end of the second week. There may be discharges from the body for quite a number of years afterwards in the urine.

Q. After the patient has recovered?

A. Yes sir. In some cases it has been found as high as eight years. It has been found in urine eight years after an attack of the disease.

Q. In the urine?

A. Yes sir.

Q. In the urine of a patient that was apparently fully recovered from the disease?

A. Yes sir.

Q. Now you spoke of a process of staining they discovered?

A. Yes sir.

Q. While they were staining sections taken from the intestinal canal of a man dead from that disease. Explain
43 so that I can get it into the record what the surgical process of staining means.

A. That is an important question, too, because in 1877 Weigert discovered that bacteria had an affinity for aniline dyes.

Q. You mean bacteria?

A. Yes sir, the bacteria.

Q. Harmful as well as harmless?

A. Any kind. They have an affinity for analine dyes. They took the dyes within their structure, consequently they became stained blue, red, pink, or green. They took the color that you cared or wished them to.

Q. That is, the bacteria partook of the hue of the dye?

A. Yes sir. Well, consequently, the tissues could be made to be dyed green or red or blue, but the dye could be taken out of the tissues much more easily that they could be taken out of the bacteria, so that these micro-organisms could be seen distinctly standing out as, say, green bacilli on a field of red.

Q. It would be very plainly discernable?

A. Yes, sir, the typhoid bacillus does not stain so well as some of the other pathogenic bacteria. Neverthless it was seen very distinctly with the coloring methods used by Koch and Eberth, working independently. They were not working together, but were working independently, and both saw it
44 in the same year, and discovered it and described it.

Q. Described that process of staining?

A. Well, if they were simply staining it for the typhoid bacilli, they would take any one of the basic aniline dyes, such as methylene blue, make a saturated alcoholic solution of that first, and then an aequeous solution is made from that. The alcohol solution is added to water until we have a slightly opaque fluid. The tissues are cut in very minute sections, which are immersed in this fluid and left in it for a time. They are then taken out and washed and mounted, studied with a microscope, and the bacteria will have taken up the color to themselves so that they will appear much darker than the surrounding tissues which are also stained blue, and part of that color can be taken out of the tissues by alcohol afterwards, so that part of the color out of the tissue leaves the dye more distinct in the bacilli than in the tissue.

Q. What do you mean by the tissue?

A. The mucous membrane of the intestine of the patient dead of the disease.

Q. You use that?

A. Yes sir, or usually the spleen.

Q. Now going back to the cholera bacteria, I believe you
45 said awhile ago, that is what is considered a water-born bacteria?

A. Yes sir.

Q. Now what is the form of that bacteria?

A. Koch's word covers it very clearly. He calls it a comma.

Q. Did he discover it?

A. Yes sir.

Q. When and where?

A. He discovered it in 1885 in India in the intestines of people sick, in the intestinal contents of people sick with cholera, or in the intestinal contents of people dead with cholera.

Q. He was a German, how did he come to be sent there?

A. He was sent there by the English government.

Q. For what purpose?

A. To study the cholera.

Q. The result was the discovery of this bacteria?

A. Yes sir.

Q. Now did he discover any other characteristics other than what you have named?

A. He discovered it in the intestinal contents of people sick or dead of the disease, and he found it in the water of one of the tanks in India, from which the cholera had come, from which an epidemic of cholera had spread.

Q. Did he make any further experiments with that
46 bacteria?

A. Yes, quite a number of them.

Q. In what way?

A. He put it in steriled water and also studied it in living water, and he found out that it would live a definite number of days in various kinds of water.

Q. Is it subject to changes of temperature—water hot and cold?

A. Yes sir.

Q. And what degree of heat does it take to kill it?

A. It takes a temperature of boiling water to kill it.

Q. What degree of heat is boiling water?

A. Well, if you are speaking of centigrade—100 centigrade, five or ten minutes.

Q. And freezing, how much will it stand?

A. It will stand indefinite freezing.

Q. It is impervious then to freezing?

A. Freezing does not destroy it; that is, steady cold; but alternate heat and freezing will destroy great numbers of the bacteria very rapidly.

Q. Now is it an active bacteria?

A. Yes, highly active; it is motile, a swimmer.

Q. Now as to propagation, does it increase rapidly or slowly?

A. Rapidly, very rapidly.

Q. In what form does it increase most rapidly, in water
47 or in the human system.

A. In the human system.

Q. Does it increase in the water at all?

A. I think no experiments have shown that it multiplies in the water.

Q. Is there any culture in which it can grow?

A. Yes, it will grow in all media easily.

Q. It is a bacteria that is easily experimented with?

A. Yes sir.

Q. Now is it a disease that is considered contagious through liquid, or contagious through the air mostly?

A. It is a water-born disease.

Q. Can it be taken through the air?

A. Yes, there is a possibility in that. It retains its vitality for quite a little while when it is dried. In the mucous discharge from the bowels, for instance, that can be dried and float into the air and remain virulent for a long time. There is a possibility of it being conveyed in that way; shaking sheets that are not sterilized in the air, and throwing a dust of that character in the air, that is remotely possible, and then people who are about cholera, handling people sick of the disease, they have great dis-
charges from the bowels and vomit a great deal, and con-
48 sequently more or less dejecta from the body all about
them, so that those who handle the disease are very liable to contract it from the fact that they have put their hands to their mouths and their noses and they convey it into their mouths and their noses. There is that method of conveyance, but the great method, or way in which it is generally carried, is by water carriage, drinking water that has contained the discharge of the people sick or dead of the disease.

Q. Is there any connection between that common method of conveyance and the fact that it easily follows the given routes of travel around the world?

A. It follows the routes of travel because people sick of the disease travel along certain routes.

Q. Give us that method?

A. Because they move in that direction. People coming up from India through Russia, go down into Germany, over into France or England, and across to America, that is the route it takes, affecting as it goes.

Q. Now, then, bacteria might be communicated from the deads' clothing or from the affected individuals in the same manner, possibly?

A. Yes sir.

Q. What is the usual method of conveying it?

A. Water carriage.

49 Q. Water or milk, or some such liquid form?

A. Water carriage—it gets into the water supply, it gets into the drinking water of a community, and is carried into the intestines of those who drink the water, and those susceptible contract the disease.

Q. It can go then into milk, through the connection of a pump and a milk can?

A. Yes sir.

Q. In that way it might be conveyed?

A. Yes sir.

Q. Now there are certain bacteria that arrest their own destructiveness, isn't that so?

A. All of them do.

Q. The injurious and non-injurious?

A. Yes sir.

Q. Now, will you just describe that process?

A. Why, bacteria produce toxins or poisons, as I showed you before, the diphtheria bacillus, for instance.

Q. Explain that, Doctor.

A. Bacteria growing on or in a medium produce toxins, and after a time when they accumulate in sufficient quantities, stop the growth of the bacteria. They do not destroy exactly, but there is not enough nutritive media left for them to grow upon, besides the toxin prodaced inhibit the growth of the microorganism.

50 Q. That is, a man might have diphtheria, or might have typhoid fever, and not be free of poison, and still recover?

A. Yes sir.

Q. Now that would indicate there is something in the human system that has the effect or power of overcoming the bacteria that caused the disease?

A. Yes sir, that is anti-toxin.

Q. And that is the anti-toxin that is in the system, is it?

A. Yes sir.

Q. And that is caused by other bacteria—by the same bacteria that cause disease?

A. The body itself produces anti-toxin to the specific bacteria.

Q. Well, does the poison that is thrown off with this bacteria, so that a man gets well without the pure anti-toxin, does that have the effect of curing him of his disease?

A. Yes sir.

Q. Now there are certain bacteria known as spores, are there not?

A. No sir, not certain bacteria, but some forms of bacteria produce spores. A spore is known as the resting stage of the micro-organism.

Q. It is a micro-organism that belongs to the bacteria
51 group?

A. No. I think, Mr. Crow, you have not clearly in mind what a spore is.

Q. No, perhaps not.

A. A spore is something like a grain, like a wheat grain on a wheat stalk. I think we had better go back to the structure of bacteria before we begin about spores. After we get that, we can get a simple classification.

Q. Go ahead with that, then.

A. Now, bacteria, as we know them, consist of a cell wall, and cell contents. Speaking of classes, I will speak of the bacillus first. I will represent it as resembling a wienerwurst sausage, perhaps not so complicated. We have the skin on the sausage, and the meat on the inside of it. Now, the bacillus is made up something similar to that, they have an outside cell wall, composed of cellulose, and an inside contents not quite so complicated as a sausage, but it is composed of protoplasm known as the micro-protein, and that is the cell contents. That outside cell wall of cellulose has attached to it, or part of it, a

gelatinous wall, and that gelatinous wall, when the micro-organism is dry, is tight to the bacillus, but when the bacillus is moistened it separates out and form a thick layer upon it, making a thick coat upon it. Now from that cell wall in some of
52 the micro-organisms we have whip-like processes extending out 15 or 20 times as long as the bacillus itself. They are long threads. They are known as flagella. If there is only one of these little threads, it is known as the flagellum. If there are many they are known as flagella. Now by means of these flagella on the micro-organisms, motion is produced. These flagella are spiral, and they whirl in the water and send the micro-organisms along as swimmers. Now there is the cell contents, cell wall, outside capsule, and the flagella on some of them. Now these micro-organisms when brought into suitable conditions of temperature and moisture and nutrient media, grow. They are unicellular, almost transparent, or translucent, when you look at them when unstained. When the media and temperature suit, they grow, and then reach a certain size, and when they reach that size they stop growing and send a division down through the middle of the cells. If I could project a partition right down through the middle of my finger like this (indicating) that would give you some idea of the process. Where there was one, there are now two, and each grow into a micro-organism in about a half an hour under suitable conditions, so that in that way it has been calculated that there are 17,000,000 bacteria can grow from one cell in 24 hours, so that they
53 grow very rapidly, although exquisitely minute. Now, some of them, instead of dividing in the way I spoke of, do another thing. In the cell contents of the micro-protein little bright specks appear and coalesce and form finally a hard resisting body within the cell wall of this micro-organism. All the micro-protein in the cell wall goes into this body and forms what is called a spore, that is the seed of this bacillus, and that spore puts on a very thick, highly resisting membrane, and has a contents within it like the yolk in an egg. That wall is very thick and highly resisting, so that it makes these spores the most highly vitalized things on earth. Absolute cold does not freeze or destroy them, and to destroy the spores, a very high

temperature is necessary; 150 degrees centigrade for an hour, or an hour and a half, dry heat, and anywhere from five minutes to one hour boiling temperature, temperature of boiling water, or from five to thirty minutes streaming steam, and from five to ten or twenty minutes steam under pressure, one and one-half atmospheres. The thing that resists these high temperatures is the most highly vitalized thing on earth, and that is the spore.

Q. Now are they found in the water or in the air—these spores?

A. Oh, they are everywhere, everywhere on earth. They are ubiquitous.

Q. Now are they inimical to health in any way?

54. A. Some of the pathogenic organisms form spores, the anthrax bacillus for instance. That is a hightly resisting spore. Tetanus (lockjaw) has a highly resisting spore that is especially obnoxious.

Q. Does the typhoid fever have any spores?

A. No sir.

Q. Or cholera?

A. No sir.

Q. Or diphtheria?

A. No sir.

Q. Then it is found in no other diseases except tetanus and anthrax?

A. Well, those are the principal ones that produce spores.

Q. Now bacteria are also used for the purpose of water filtration, are they not?

A. Yes sir.

Q. Now will you explain in what way bacteria are useful as water filters?

A. In the construction of a sand filter for the artificial filtration of water (what is known as the English system), large reservoirs are constructed, and these reservoirs have, first, large rocks at the bottom, and then heavy gravel, and then smaller gravel, and then coarse sand and then sand not so coarse,
and then a layer of fine sand on top of that. On that
55 bed, on top of this sand, water is allowed to flow,
and percolates through. The effluent runs out of those
filter beds, unchanged for several days—ten or twelve days or

two weeks sometimes—and then the filter begins to act properly. The sediment in the water is taken out, and as high as 99 per cent. of the bacteria are removed. Now what has occurred in the filter to remove all the sediment and bacteria is an extremely interesting thing. I spoke of the structure of bacteria, the cell wall and the gelatinous layer upon it. What occurs here is that the micro-organisms that are in the water—water born bacteria—form a sticky membrane which sticks to the rocks and sand, so that when you take hold of the sand or feel the rocks at the bottom of the filter the bacteria have developed a layer which feels like slime to the fingers. It means that each micro-organism settled on the sand or rock stuck to it, and as his neighbor came along, it stuck to him, and in that way they soon form a blanket of bacteria stuck together on and in the sand, making a top layer on the sand, so that the water which is two or three or four or five feet above the sand layer is resting on a layer of bacteria, which is a blanket of bacteria on this sand. They are slimy, stick together, and consequently catch every solid particle that falls through the water. They catch not only the solid organic matter, but all the solid inorganic matter. They catch all the bacteria that come within this field, consequently
56 they separate out all the pathogenic and non-pathogenic bacteria. The water running into the filter may contain many thousands of bacteria, but very few run out. Some filtered waters contain very few, in fact, the German regulation is to have filtered waters contain not more than a hundred bacteria to the cubic centimeter, or some similar standard. In a short while they cover the sand layer and all the stones in it to such an extent that they prevent the water from passing through rapidly, and finally the filter ceases to act properly. Then the water is allowed to run off, the top layer of sand taken off and cleaned. Water is then run in again and the filter will ripen up and go to work again in a few days. That is what I mean when I say that the filteration of water in a sand filter is a biological phenomenon.

Q. That is what is known as the ordinary sand filter?

A. Yes sir.

Q. For use in settling basins for water supplies?

A. Yes sir.

Q. And has it proved efficient and perfect?

A. Yes sir. I saw such filters at work in London, in Berlin and Hamburg. They were very efficient.

Q. Now these grown bacteria that settle on top of this sand and rock and form this blanket as you express it, that causes a cessation of the passage of the organic and inorganic matter. They are the common bacilli, they are harmless and found ever present in water of all kinds, in living water?

57 A. Yes sir.

Q. If the fact is a fact that the typhoid bacilli will occasionally go through this—

A. Yes sir.

Q. That is demonstrated in what way?

A. By typhoid breaking out in a community.

Q. Where these filters exist?

A. Yes sir.

Q. Now, is there any natural filter that is absolutely germ proof? In speaking of a natural filter I mean a filter that is not like a tripoli stone—anything of that kind?

A. It would depend upon the thickness of the tripoli stone. If it is perfectly hard and no cracks whatever in it, if it is a perfect stone in other words, under those conditions, and the conditions about the filter were right, all rubber gaskets are right and all the clamps secured down snugly so that the bacteria cannot pass through the sand or through the stone itself, or the rubber gaskets at the top or bottom of the filter, why a stone of that kind is really germ proof for a time. The stone must be sterilized before putting it into the filter, and the water will run through it perfectly free from bacteria for three or four or five days; then the bacteria have grow through the stone out into the water again.

Q. Have grown through the stone—what do you mean
58 by that process, when you say have grown through the
stone?

A. I showed you. The bacillus grows long, about that long (indicating). It divides into—these bacteria are anywhere for 1-1000 to 1-100,000 of an inch in diameter. Now one of those bacilli sticks his head or end of him into the little crevices or holes in the stone, and it grows. When it grows it will twist about in the little crevice or tunnel in the stone so that finally it will grow through any distance of stone and appear at the other side. It finds nutrient medium all around it in the stone. It is nice and moist and the temperature is right, so that the bacteria soon grow through. They will go through a Birdfelt filter or a Pasteur filter in three days.

Q. Then after a period of ten days or two weeks there is no filter which is absolutely proof against the typhoid germs?

A. No sir.

Q. And that is true of the cholera, isn't it?

A. No. I said no. I didn't quite catch a portion of the question. You spoke of the typhoid bacillus coming through the filter. The typhoid bacillus doesn't grow in water very rapidly, if it grows at all, so that for the typhoid bacillus growing through the stone, that is not so, unless the conditions
59 were very favorable for it.

Q. What form of bacillus would do that?

A. The common water born bacteria.

Q. One that is harmless?

A. Yes sir.

Q. Then your idea is that a filter would stop the typhoid bacillus?

A. A good filter will stop typhoid.

Q. Kept in proper shape at all times?

A. Yes sir.

Q. But it would have to be used constantly?

A. It will work if the individual who is using it is a skilled man and will take care of it himself, but if it is left to the ordinary servant it will be in bad condition at all times.

Q. Now what different classes of bacteria are found in the sewage that comes off from a city?

A. Now, do you want me to give you the classification of bacteria?

Q. Yes.

A. Bacteria are classified in a variety of ways, but by bacteriologists who do not go into the exquisite detail of the botanist, the bacteria are classified according to form. We say bacteria are classified according to form into the micrococcus first. These are spherical bodies like an orange or a billiard

60 ball; secondly, another form is that of a bacillus like a short rod, rod-bacillus, it is called. It is a short rod. Then the third is the spiral form I spoke of. That is in form more or less like an open spiral.

Q. Represented by a comma?

A. Yes sir, the punctuation mark, comma. Now that is the classification according to form. Then they are classified according to whether they contain spores or not. The spore-bearing and the non-spore-bearing. Then they are classified into aerobic and anaerobic, as to whether or not they grow in the presence of oxygen. They are classified into the pathogenic or non-pathogenic; those that produce disease and those that do not produce disease.

Q. Those are the different classifications?

A. Yes sir.

Q. Now which are the most prevalent of the different kinds?

A. The non-pathogenic.

Q. That is a general classification?

A. A general classification shows the non-pathogenic, exist in vastly great numbers.

Q. Now there are two classes of these non-pathogenic that represent a certain agency in the destruction or elimina-
61 tion of sewage matter from water, isn't there? What do you call those two classes?

A. You mean the aerobic and an-aerobic?

Q. Yes.

A. You ask me the question, coming from the water, do you mean containing, both containing the pathogenic and non-pathogenic?

Q. Yes, you have stated that. Now, then, the other two represent two other forms of bacteria, that represent the opposition or rather the opposing forces in the destruction of sewage, one producing in the presence of certain substances in the sewage matter, and the other not.

A. Yes sir.

Q. Now the sewage that is running in the open water of the river, which of these two forms of bacteria will be the most active agency in that?

A. In the destruction of the sewage?

Q. Of the sewage, yes.

A. In the open stream?

Q. Yes.

A. The aerobic.

Q. Now what would be the effect of that upon the sewage in the running water?

A. It would be its gradual reduction from the higher compounds to the lower compounds.

Q. Now would that reduction affect the vitality or ex-
62 istence of the disease bearing bacteria in that running
water?

A. Not the mere destruction of the bacteria in the water, no, but the action of the toxins of the individual bacteria upon one another is a vital problem.

Q. What do you mean by that?

A. I mean this: You take bacteria confined in a space all growing vigorously and active, and each producing its kind, and giving forth its products, these products are not only poisonous to themselves, but poisonous to other bacteria around them, and some bacteria produce poisons that are very deleterious to others.

Q. That was true of the bacteria in the running water?

A. Yes sir.

Q. Is it known that the injurious agencies are running and operating in the running water, and whether in that way they tend to destroy the cholera or typhoid or dysentery bacteria?

A. Now if the waters available were merely polluted, the action would be much less where the water was confined than where it was running.

Q. In this form of water there would be less liability of the destruction of these bacteria than there would be if they were confined and the water was still?

A. Yes, they woul die much quicker in stagnant water
63 than in running water.

Q. In other words, the toxin would be much freer to have its effect?

A. Yes sir.

Q. I believe you said that bacteria belong to the vegetable kingdom?

A. Yes sir.

Q. What is the reason scientifically that they are classed as belonging to the vegetable kingdom?

A. First, the structure of the microbe is purely vegetable, cellular in contents; then the method of feeding—some of the forms closely allied to the algae contain chlorophyl, the green coloring matter of plants. In the presence of sunlight the chlorophyl breaks up carbon dioxide, retaining the carbon and giving off oxygen. Some of these forms have green coloring matter in them, showing that they belong close to the algae. Then the way in which they break up these highly complex compounds, albuminous molecules, for instance, is characteristic. They have to have organized food. When they get it they break it up into lower and lower compounds. This action is seen in the destruction of organic matter in sewage from organic matter to ammonia, to nitrites, to nitrates, and thus sewage can be traced in a running stream.

Q. Then the science of bacteriology as taught in modern
64 times is that these bacteria in some form are ever present
in the air and water, and in animal and vegetable life, all
animal and vegetable life?

A. Yes sir.

Q. And that they are the source of most, if not all, of the diseases that the body is heir to?

A. Yes sir.

Q. There are some, however, of the bacilli that have not been discovered?

A. Yes sir.

Q. What diseases and what particular bacilli cause them?

A. Syphilis, for instance, smallpox, measles, and diseases of that kind.

Q. Scarlet fever?

A. Scarlet fever. A gentleman from Chicago by the name of Class discovered a coccus which he claims to be the cause of scarlet fever, and I saw in the newspaper today an account of a German having discovered the same thing, several years afterwards. I suppose he will get the credit for it.

Q. Do you know whether there are any septic tanks in use in this country, by cities, for the destruction of their sewage?

A. There is one right here in Clayton.

Q. How large a place is that, a small place?

65 A. A small place. Washington University has a septic tank. At least, they were to have one put in. I was consulted about it some time ago.

Q. Do you know whether Kansas City has any?

A. I do not. I know they have large cess pools.

Q. Into which sewage is allowed to run?

A. Yes sir, into which sewage is allowed to run. They are practically septic tanks.

Q. When you cover a septic tank, do you wall it with brick or sheet iron or something of that kind and close it up tight?

A. Yes sir.

Q. Shutting the air out?

A. Yes sir.

Q. You put nothing in there whatever to hasten decomposition?

A. No sir.

Q. You just simply let nature do its work?

A. It takes it course, yes, sir.

Q. What is the result?

A. The reduction of the higher heterogeneous nitrogenous compounds into the lower and lower and lower forms of chemical compounds, until they get back to the simple compounds of hydrogen, menthane, nitrogen, carbonoxide, ammonia and water.

Q. Now in that process is there any unhealthy or deleteri-
66 ous odors that come from these tanks that would be injurious?

A. Not if the tanks are covered. It is only so if the gases are allowed to be discharged from these tanks. This remaining material is generally used for irrigation puposes.

Q. Now does this process tend to destroy typhoid germs?

A. Yes sir.

Q. Does it destroy them?

A. Yes sir.

Q. And cholera germs?

A. Yes sir.

Q. And dysentery germs?

A. Yes sir.

Q. Then a septic tank properly constructed and maintained in a proper way would be an absolutely sure way of destroying any germ bearing bacteria in the sewage of a city, if the sewage of the city was confined exclusively in septic tanks?

A. Yes, but it would depend upon the time the sewage remained in tanks.

Q. I say, a proper length of time, and properly maintained?

A. Yes sir.

67 Q. I mean that if kept in the tanks a sufficient length of time for nature to perform its work and reduce the sewage?

A. To the lower compounds, yes, sir.

Q. After that it would be safe to scatter it upon the fields for the purposes of irrigation?

A. For sewage farms and things of that kind?

Q. Yes.

A. Yes sir, for fertilization.

Q. Do you know of any cities where they have built that system?

A. Yes sir, there are several in England.

Q. What cities?

A. I saw one, I think, in Exeter.

Q. Do you know how large a city that is?

A. No sir, I don't remember. I saw some septic tanks quite a number of years ago, somewhere along in 1896, I think it was, when they were first constructed.

Q. Those you saw were a success, were they?

A. They were under trial. Then I have spoken or talked over the subject a number of times with Mr. Clark of the Massachusetts Board of Health in regard to their results with septic tanks and the destruction of sewage with them.

Q. Do they use septic tanks in Massachusetts?

A. They were experimenting with septic tanks.

68 Q. Do you know of any place where they have got beyond the experimental stage?

A. I do not just now.

Q. Did you say Exeter?

A. Yes sir.

Q. Do you know anything about the experiments that were made at a place called Exeter?

A. I know what is in the literature, anybody knows that.

Q. Did you ever inspect the sewage system of Berlin?

A. Yes, I went all over it.

Q. Have they what you call the sewage farm system in Berlin?

A. Yes sir.

Q. What is that?

A. There the sewage is collected in large reservoirs in the town and from these reservoirs it is pumped out on to what used to be a sandy waste, which are now productive farms. The water is pumped up into the tanks upon those places, and then distributed for irigation all over those farms, and it lies upon the surface for a time, percolates down through the sand, and a good deal of it passes into large ditches at the side of the field and out into the water courses.

Q. In what stage of that process is it supposed that the bacteria are eliminated?

69 A. On the fields.

Q. On the sand fields?

A. Yes.

Q. By the filtration?

A. Yes, at the top of the soil they are held and destroyed; their action is something like that of the bacterial blanket I spoke of which forms on the surface of the sand in the sand filter.

Q. Do you know what the results of that sanitary arrangement has been as to whether or not it has tended to reduce diseases that were conveyed by water born germs?

A. Yes, it destroys the germ on the field.

Q. Then it would be a safe way to conduct a city sewage system?

A. Yes, that is a very fine way. Paris was constructing sewage farms when I was there in 1896; in fact, they had one under trial. I didn't go out to see it, but I know that it was there, and they were building it, and when a Frenchman adopts a German method, it must be a pretty good one.

Q. Now are there any other cities that have any similar system of handling their sewage matter?

A. Well. I know that one in Berlin. I went all over it, and I had a personal experience with it. I know there was one at Pullman, Illinois. What became of it I don't know. There are a number of the small cities and institutions of vari-
70 ous kinds, insane asylums, poor houses, places of that
kind that use them throughout this country, and they work satisfactorily.

Q. Now do you know at what point or percentage the sewage matter in running water is so great as to cause experts to say that the water is no longer healthful to use for domestic purposes?

A. Do you mean how far it will carry?

Q. No sir, I mean how much must be the pollution of sewage in running water?

A. It must be very great.

Q. The greater the volume of water, of course, the greater amount of pollution it would carry?

A. Yes sir.

Q. The greater the volume of water doesn't affect the liability to disease that might come from water born bacteria?

A. We will probably illustrate that better if we take one bacterium to a quart of water. Then we add three or four hundred gallons to that. The chances of that bacterium being again found in that three or four hundred gallons is so many times less.

Q. That wasn't the point of the question.

A. But it doesn't destroy the bacteria.

Q. It doesn't affect the vitality of the bacteria or de-
71 stroy it?

A. No sir.

Q. Now take cholera or typhoid or dysentery bacteria, will they generate and increase on the soil?

A. It depends upon the amount of nutritive matter that they receive. Some recent experiments have shown that the typhoid bacillus, for instance, will live a long time on the soil, a year or more, live and multiply if the conditions of growth be made favorable. That is, if the conditions around them are made satisfactory for growth, they live a very long time and they multiply there.

Q. Well, do the substances that flow as a city sewage, or what you term broth for the generation of the disease, bear germs?

A. Yes, for disease bearing germs, but not unless it was sterilized. If the broth were cooked all the bacteria would be killed in it. It would then be a medium for some of these micro-organisms to grow in.

MR. DRENNAN: Has that ever happened?

A. Not unless it is a laboratory experiment.

MR. CROW: The bacteria of typhoid and cholera and dysentery coming from city sewage will come from that class of sewage that came mostly from hospitals, or mostly from homes—which?

A. Homes.

Q. Why is that?

72 A. Because hospitals usually use better disinfecting methods.

Q. Now explain why they use better disinfecting methods, and what those methods are?

A. Well, any well organized hospital has an efficient force, and it has certain rules for the destruction of infectious material, burning up the old clothes about the wards, and so on. That is the natural purpose of a hospital—cleanliness. Then the dejecta, those things from the bowels, the materials ejected from the stomach, etc. To these materials invariably, in hospitals that are well conducted, disinfectants are added. They are kept for a certain time after the disinfectants are added to destroy the micro-organisms. I mean in the well conducted hospitals. But in a home the physician gives his instructions and they are carried out by a quasi scientist, one who means well, but doesn't know how. The result is the material is thrown into the sewer as quickly as possible, either improperly disinfected or not at all.

Q. Then your experience would be, and you believe the fact to be, that the disease bearing germs that flow away from a city in the sewage of that city would be borne mostly from the homes of the city where the disease existed?

A. Yes sir.

Q. Of course, in the case of an epidemic of disease,
73 these micro-organisms scatter themselves promiscuously
throughout the city, do they?

A. Yes, if it was the general water supply that was scattering it.

Q. I am speaking about that kind of an epidemic now?

A. Yes sir.

Q. Now the epidemics of typhoid and cholera and dysentery are usually caused, or believed at least to be caused, by what?

A. By the water born micro-organisms.

Q. That means a tainted water supply, doesn't it?

A. Yes sir.

Q. Is that true in this country at this date?

A. Yes sir.

Q. Has it always been true?

A. Yes, where precautions are not taken to separate out the disease producing bacteria.

Q. What is the most common disease bearing bacteria that is born in the water of this country?

A. Typhoid.

Q. Is there any specific reason for that fact existing?

A. Yes sir.

Q. What is it?

A. Because crude sewage is discharged into the water
74 closets, and water closets discharge into sources of water
supply.

Q. You use the word "crude" sewage, what do you mean by that?

A. Sewage that is not treated.

Q. That is not disinfected, or incinerated, or something of that kind?

A. Yes sir.

Q. Nothing done to it that would destroy the germs of disease?

A. Which has germs of disease in it.

Q. Now, are you acquainted with the length of time that the cholera germ will live in water?

A. Yes sir. I have carried out some personal experiments, if you want to know about them.

Q. That is a pretty good source of information. Give the conditions under which they were made.

A. I found they would live in the Mississippi river here, in the sunlight and dark, from 12 to 25 days.

Q. What do you mean by that, in the sunlight and dark?

A. I mean this, that a sterilized flask was secured, and into it was put from four to six ounces of Mississippi river water taken from the river. That was living water. Into that water was inoculated or sown cholera bacilli, taking a large loopful of the growth, off slant ager. That was stirred
75 about in the water.

Q. Whereabouts was that taken from?

A. The Mississippi river, out in the middle of the river.

Q. At what point in the river?

A. Below the intake.

Q. Below the intake at the city of St. Louis?

A. Yes, sir. Now these bacilli were inoculated into the water and placed in a window facing south so that the sunlight was upon them a definite number of hours per day. Every day the water in those vessels were stirred up, so that the sediment that had collected on the bottom of the vessel was mixed throughout, and with about three hours and a half daily exposure to sunlight, the micro-organisms live as high as twelve days in some of these flasks. That is, some bacteria were still found alive at the end of twelve days, in sunlight, while in the gloom—

Q. What do you mean by that?

A. Why, some of the flasks were put in an ice chest and kept at a temperature of from 15 to 20 degrees centigrade, always in the dark.

Q. What was the ordinary temperature?

A. 68 degrees temperature, Fahrenheit, 60 to 70.

Q. How long did you say they lived in that condition?

A. They lived in that condition as high as 25 days, not exposed to the sunlight.

76 Q. The same character of water that those were in that were exposed to the sunlight?

A. Yes, living water, gradually becoming stagnant.

Q. Now, when were those samples taken by you?

A. Three years ago.

Q. Were those experiments made immediately after the water was taken?

A. Yes sir.

Q. How does cold affect this cholera germ?

A. Alternate thawing and freezing kills them.

Q. Well, supposing the Mississippi river had cholera germs in it, and it should freeze over, what would be the effect?

A. It would not hurt them.

Q. It wouldn't hurt the bacteria at all?

A. No, sir.

Q. Supposing it had typhoid fever germs in it?

A. It would not hurt them.

Q. Now, are you familiar with any epidemics caused by cholera germs in water supply?

A. Yes, sir; at Hamburg, in Germany.

Q. When did that happen?

A. In 1892.

Q. Do you know what caused that epidemic?

A. Yes, sir. The Jews were being driven from Russia
77 at that time and some of them settled on the Quay, at Hamburg, waiting for ships to transport them to the United States. There was cholera among them, and their dejecta was thrown into the river Elbe, below the water works. There is a tide in the river, which carried this material upstream, which was caried into the intake of the Hamburg water supply. There were no filter beds there then, the water was used unfiltered, and in the course of a very few days there were a great many thousands of cases, some 18,000 cases, developed. There is a town just next to Hamburg called Altoona. It is situated below Hamburg on the river, as Carondelet is related to St. Louis. The water supply of this town is taken from the Elbe below the sewers of Hamburg. Nevertheless this town was free from cholera. Wherever the Altoona water supply went, even right up against the Hamburg line, there was no cholera, except among those that drank water in Hamburg and lived in Altoona. Later a break occurred in the filter bed in one of the Altoona sand filters and a flurry of cholera followed. That break was corrected, and the cholera disappeared from Altoona. This is one of the most beautiful examples in the world

of a water born disease carried by a water supply. Professor Koch was called to Hamburg and studied the water supply of both places and found the cholera bacillus in the river water, the river Elbe.

78 Q. That is subsequent to the time that he made the discovery in India?

A. Yes, sir.

Q. Now, do you know how long the dysentery germ will live in the water?

A. I do not.

Q. Do you know how long the typhoid bacteria will live?

A. I know of my own experience, sir.

Q. Well, that is a good way of finding out.

A. It depends on where the water comes from. If it is from the lake or the drainage canal of Chicago, or the Illinois river at Joliet, or at Peoria or at Grafton, or the Mississippi river, or the tap water here. I have got all those facts in some work I have done on that question.

Q. Take the Mississippi river water here at St. Louis. What length of time do your experiments lead you to believe that the typhoid germ will live?

A. I think it is from as high as 8 to 21 days.

Q. Is that in sunlight or dark?

A. In the sunlight as high as 8 days, and in the dark as high as 21.

Q. When did you make those experiments?

A. All last summer. I worked from June until September.

Q. You did that by taking samples of the water?

79 A. Yes, sir. Now, that is living water I am talking about. In the year before that we worked constantly for several months on that same subject, with sterilized water, from this same source, and we found the micro-organism would live from 25 to as high as 60 days in the sterilized water.

Q. That is to say, they retained their vitality that long?

A. Yes, sir; they were found alive.

Q. I believe you testified a while ago that these typhoid bacteria were known to live and retain their vitality in a man's organization for as high as eight years after he had been attacked with the disease?

A. No, I didn't make that statement. I said bacteria were found in the urine of a man eight years after he had had typhoid fever. That wouldn't mean that the bacilli had lived all that time in him. It simply means that this man had a good culture medium for growing typhoid bacilli in his bladder, and that he probably had a large prostatic gland with a small pocket behind it, in which urine collected, and in which the typhoid bacilli found comfortable conditions for growth. It is a snug place containing nutrient medium and the bacillus grew abundantly there.

Q. Have there been any experiments made to discover how long typhoid bacteria will exist in a man, that is, the identical bacteria?

A. No, that would be extremely difficult.

80 Q. It would be almost impossible to do that?

A. You would have to label the bacillus and send him through.

Q. The only experiment you can make is to put the bacteria in water in a bottle, and that has been a common form of making those experiments?

A. Yes, sir.

Q. Now, do you know of any other experiments made by any other than yourself?

A. There are a great many on record.

Q. What were those experiments?

A. Well, the scientists of the Massachusetts state board of health found they would live 25 days in the water of the Merrimac, in experiments at Lawrence and Lowell.

Q. Is there any other place where they have ever experimented?

A. Yes, throughout the literature, quite a number.

Q. What would be the average time?

A. About that time, from a few days to as high as 25 and 30 days, and always longer in steriled water, of course.

Q. Now, I believe you testified that the effect of the sand filters at the places where you observed it, in London and other places, was to diminish the amount of typhoid and other diseases from the water-born bacteria?

A. Yes, sir.

Q. Now, do you remember any facts or statistics in connection with that?

81 A. No, I do not remember the exact figures. I know there was a large percentage of typhoid fever in Hamburg before the filters were put in and the number of cases was very rapidly reduced after the filters began to work. Those statistics are recorded in books on that subject and can easily be put in evidence.

Q. Have you had any experience with any typhoid epidemics in this country, other than in the city of St. Louis?

A. No, sir.

Q. Have you had some experience with them here in this city?

A. Yes, sir.

Q. How many of them?

A. We had one great typhoid epidemic here in 1892.

Q. That was prior to the time that the present intake was placed at its present existing spot?

A. Yes, the intake was then at Bissell's point.

Q. Where is that with reference to where the present intake is?

A. The present intake I suppose is six or eight miles above that on the river.

Q. Both on the Mississippi river?

A. Yes, sir.

82 Q. How far is the present intake from the west shore of the Mississippi river?

A. How far out in the water?

Q. Yes.

A. I think it is 1,500 feet. I never measured it, but I was told that.

Q. How far out was the former intake?

A. It depended upon the stage of the river, just a few feet out in the river, but they had a sliding intake, that was adjustable, could be run it out. As the water became low I think they would send this flexible intake out to it.

Q. Do you know the width of the river at the present place of the intake?

A. I do not.

Q. You never had it measured?

A. No, sir.

Q. Do you know whether it was half-way across the river or more?

A. It was not quite half way across. It is on the Missouri side.

Q. How far above the city is it?

A. Fourteen miles, I believe.

Q. How far below the mouth of the Missouri, the confluence of the two streams?

A. Six or eight miles.

83 Q. Six or eight miles from the confluence?

A. Yes, sir.

Q. Now, you have been to the confluence of the two rivers?

A. Yes, I am on the river a great deal.

Q. The division of the waters there is quite perceptible, isn't it?

A. Yes, sir.

Q. It isn't perceptible, however, is it, at the intake?

MR. HAMLIN: I would suggest, General Crow, that your questions are leading, and I object.

MR. CROW: I supposed the object of this inquiry was to get the facts as quickly as possible.

THE WITNESS: I can say this. I have traveled up and down the river a great deal, and I know a great deal about the character of the waters from its visual appearance.

Q. Well, at the present intake of the St. Louis water works is there anything in the water that would indicate the presence of two distinct streams?

A. The number of bacteria per cubic centimeter would be an index. Also take a cross section of the stream, which would show the percentage of total solids.

Q. Well, in the appearance of the water of the streams, is there anything to indicate in the stream that there is present more than one stream in that body of water at the place
84 of the intake?

A. Yes, depending upon the stage of either river. Now, if the Missouri river is very high, it can be very distinctly seen at the intake. Its great volume of yellow water runs down clinging to the Missouri shore, and can be seen. If the Mississippi is high and the Missouri not high, the effect of its waters can be seen at the intake.

Q. Well, if the Mississippi is very high and the Illinois is very high and the Missouri is not, what effect has that on the volume or character of the volume of water that comes over to the intake and into the waterworks?

A. Well, as a rule, under those conditions the Missouri predominates.

Q. Where the Mississippi is high?

A. Not where the Mississippi is high.

Q. I mean where the Mississippi is high and the other two are low, in ordinary stages?

A. Then the waters exist in about equal quantities, or the Mississippi water may predominate. It appears that way to the naked eye.

Q. Now, you stated that the bacteria in the water at the intake tower, when you cross sectioned the river there, would indicate the presence of more than one stream?

A. Yes, sir.

85 Q. What is there in the indication of that bacteria that indicates that to a scientific investigator?

A. Well, we know the numbers of bacteria in the Missouri river before it enters the Mississippi; we know the numbers of bacteria in the Mississippi above the junction with the Missouri river, and that these two streams flow down together, the Missouri clinging to the Missouri shore, the Illinois and Mississippi rivers combined, clinging to the Illinois shore, now the cross-section of the stream will show whether the greater number of bacteria are on the Missouri side or on the Illinois side; then we can finally reach the point where we can see the two streams are about to touch one another, or commingle.

Q. Now you use the term "bacteria" without regard to whether they are injurious or non-injurious?

A. They are non-injurious.

Q. That is, they are simply indigenous to running water?

A. Water-born.

Q. And are found everywhere in the water of these two streams?

A. Yes sir.

Q. Now are those the same bacteria?

A. Yes sir.

Q. Now you are acquainted with the waters around the mouth of the Illinois river?

A. Yes sir.

Q. You have made investigations there yourself?

86 A. Yes sir.

Q. And made examinations of the bacilli in that water?

A. Yes sir.

Q. Is there anything to indicate after the Illinois enters the Mississippi below the mouth, the presence of the Illinois river, in the Mississippi river water?

A. No sir. The bacteria of the Illinois are very similar in numbers and character to those in the Mississippi, and it is only by putting different kind of bacteria in the Illinios river and watching them as they flow, that we can trace the Illinois river water, species of bacteria that are not indigenous to either stream.

Q. Now you are acquainted with the character of the Missouri river as to its flow and volume of water?

A. Yes sir.

Q. And are you acquainted with the Mississippi also?

A. Yes sir.

Q. And as to the volume of water it flows, and as to the character of the stream, whether it is turbid or rapid?

A. Yes sir.

Q. Now do you know whether or not there is more or less soil or sand rolling with the waters of the Mississippi or with the Missouri, or have you ever investigated that question?

A. I couldn't say, but a visual inspection will show that.

87 Samples from the Illinois and Mississippi are of a less muddy color, and contain less sediment than the samples from the Missouri in the greater part of the year.

Q. Are you acquainted with the velocity of the currents of the two streams?

A. I have some figures on it, yes.

Q. In a general way do you know which is the more rapid?

A. Well, my impression was that the Mississippi above the Illinois was the more rapid stream.

Q. More rapid than the Missouri above the Illinois?

A. Yes sir.

Q. Now do you mean to say at the equal stage of water in the two streams?

A. That is in equal stages of water of course.

Q. No, would that fact that the Mississippi is the more rapid of the two, and the Missouri, as you seem to think, the less rapid, and its water more filled with sand and soil, have any effect on the elimination of bacteria from the water of the rivers as they run?

A. No, the more rapid the stream the further the bacteria carry.

Q. Otherwise it would have no effect?

A. That is right.

Q. Is there more or less of settling of sand and dirt in the Mississippi than there is in the Missouri?

88 A. Well, I think the Missouri would sediment its bacteria much quicker, because the sediment in the stream is very much larger. All inorganic particles are larger and would carry down the bacteria in the water very much more rapidly than the Mississippi river will.

Q. What would be the result of that on the number of bacteria, the non-injurious bacteria that are just useful water-born bacteria, in the two streams, in the same volume of water?

A. Both running at about equal speed?

Q. Yes.

A. For some reason or other the Missouri has the larger number.

Q. Now they are non-pathogenic, are they?

A. Yes sir, a great majority of them.

Q. Now the sand in the soil above the mouth of the Missouri river, have you ever bacteriologically examined that?

A. Yes sir.

Q. What was the result of that examination?

A. It contains large numbers of bacteria. I am speaking of the Missouri.

Q. Were they dead or alive?

A. Alive.

Q. Any of them dead—you couldn't tell that?

A. I couldn't tell that.

89 Q. Now are they non-pathogenic?

A. A great majority of them.

Q. Harmless?

A. Yes sir.

Q. Now have you ever examined at the confluence of the two rivers, the soil and the sand in the bottom of the Mississippi?

A. Yes sir.

Q. What was the result of that investigation?

A. A large number of bacteria, a very large number.

Q. What was the character of those bacteria?

A. Mostly harmless.

Q. Now do you know anything about the proportion of the bacteria in the two rivers and the sand and soil on the bottom of the two rivers at the point I mention, the confluence, as to which has the greater number of bacteria?

A. Practically about the same.

Q. Could you distinguish between the pathogenic and non-pathogenic bacteria?

A. What do you mean?

Q. Why in counting these bacteria that you discovered in your examination, in your estimate of the two rivers, or in the waters of the two rivers?

A. Not without separating out each individual bacterium to get it as a pure culture.

Q. Have you done that?

90 A. I have separated out different varieties or different species found in the rivers, the Missouri, the Mississippi, and the Illinois, at Peoria and Grafton.

Q. Well, by this method of separation then, the numbers of pathogenic and non-pathogenic bacteria could absolutely be determined?

A. Yes sir, but not absolutely.

Q. But it would be a slow process?

A. Yes sir, a gigantic task.

Q. Now you have examined the bacteria below the intake in the Mississippi river water, below the intake of the St. Louis water works?

A. Very slightly.

Q. Did you ever examine it prior to moving the intake?

A. Yes, I examined it in 1892, during a typhoid epidemic.

Q. Did you examine it in the waters of the Mississippi adjacent to the intake of the St. Louis waterworks, in 1898 and 1899?

A. In 1899 I did. In the fall of 1899 I examined the water all about the intake.

ATTORNEY-GENERAL HAMLIN: I object to that as to the years 1898 and 1899.

ATTORNEY-GENERAL CROW: For what reason?

ATTORNEY-GENERAL HAMLIN: On the ground that it does not sustain any issue in this case, from 1892 to 1899.

91 MR. DRENNAN: On behalf of the sanitary district of Chicago I object to it, on the ground that it does not tend to sustain any of the issues in this case.

ATTORNEY-GENERAL CROW: You made such examination in the years 1898, 1899 and 1900, did you not?

A. I examined the water bacteriologically, as I say, in August, September, October, November and December, I think, of 1899, and January of 1900, through to December of 1900. I examined the water in the months of 1900 up to December 1, and then in 1901 from September until December 1, we carried out a systematic bacteriological survey of the rivers and their waters.

Q. What waters?

A. First Lake Michigan, Chicago drainage canal, the Desplaines river at Joliet and at Lockport. The Illinois at Peoria on the south and Beardstown and Grafton on the Illinois; the Mississippi at Grafton; the Mississippi at Alton; the Mississippi at Hartford; the Missouri river at Bellefontaine. The Mississippi river at the intake; the Missouri shore; in the middle of the river, and on the Illinois side. That work was carried on in all of 1900 and from September to December 1, 1901. I conducted the

work personally, and samples were sent to me for special pur-
poses until April, and then later I worked from June until
92 December 1.

Q. What year?

A. 1902. I was from January to April, 1902, carrying out special work on samples from the rivers, and from June until September I carried out a series of investigations on the typhoid bacillus, on the longevity of typhoid bacillus in the living waters from all these points, both in the sunlight and in the gloom of an ice chest.

Q. Now at the same time you carried on your bacteriological experiments there were also chemical experiments being carried on in behalf of the city of St. Louis?

A. Yes, I saw them carried on, but I had nothing to do with them.

Q. You had numerous assistants there helping you in this work?

A. Yes sir.

Q. And they are mostly here in the city of St. Louis, are they?

A. I think all but two or three.

Q. In the results of these experiments you have preserved data which you have chronologically arranged?

A. Yes sir.

Q. And that covers these periods of time?

A. Yes sir.

It is agreed that all the witnesses in the case that may here-
93 after be called, including the present witness, may make
any verbal corrections in their testimony, without submitting them to counsel on either side, but any material difference must be submitted to counsel on both sides, and be made also with the permission of the Commissioner.

Adjourned at five o'clock, p. m., February 17, 1903, to meet at Southern Hotel, St. Louis, February 18, 1903, at ten o'clock, a. m.

Met pursuant to adjournment, at the Southern Hotel, at ten a. m., February 18th, 1903.

Present: The Commissioner and the same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD,

resumed the stand for further direct examination by Attorney General Crow.

Q. Doctor you are familiar wtih what is known as the Chicago Drainage Canal, that is to say, you are familiar with its location, etc.?

A. Yes, I have traveled up and down it.

Q. Now can you describe the location of that canal, just in a general way?

A. Well, I know—I have read the reports of the engineer, I went over the canal with the chief engineer, and from what I can understand, the Chicago Drainage canal connects the west fork of the south branch of the Chicago river with the Desplaines river at Lockport.

Q. Well, at what point in the state of Illinois or the city of Chicago does the drainage canal touch the south fork of the south branch of the Chicago river?

A. I understand, sir—I believe at Robey street, I don't know exactly.

Q. Where is Robey street located with reference to Chicago, is it in or out of the city limits?

A. It is well away from the centre of the city, I don't
95 know just exactly how many miles.

Q. Have you any personal knowledge as to whether or not it is within the corporate limits of the city of Chicago?

A. I don't know.

Q. You know whether or not it is within the limits of the sanitary district?

A. I don't know.

Q. You know it is located in the state of Illinois?

A. In the State of Illinois, yes.

Q. Now beginning at the point where it intersects with the south branch of the Chicago river, will you trace the general direction and the characteristics, size and depth, etc., as near as you can of the Chicago Canal, down to its point of outlet whereever that may be?

A. I would simply be speaking by the book and the figures of the engineer; I know that it runs pretty nearly directly west to Lockport. Its width in the clay portions, that is, where it passes through the earth, I do not exactly know, but I know in the rock section I was told it is 160 feet wide by 38 feet deep, the walls being perpendicular, but it seems to me you can get all of these details from their own reports.

Q. Well, that might be, but I want whatever knowledge you might have on the subject. I wish to put it in the record. Now at what point, if any, does that canal in its westerly course,
96 intersect any other body of water?

A. I don't know that any other body of water runs into it at all.

Q. At what point in its course does it have confluence with any other body of water?

A. As I say, it connects with the south branch of the Chicago river, and not to my knowledge does any other stream meet it until it gets to Lockport.

Q. Well, is there any stream there?

A. There is the Desplaines river, there.

Q. Do you know anything of the size of that river?

A. It is a small river during the dry stages, but in flood season or in the rainy season it is quite a stream.

Q. Well, could you give an idea of the ordinary size of the stream in the usual stage of water?

A. During the dry season, I see from their own reports that the amount of water in the stream would pass through an 8 inch pipe, which would be very small. Well, in the rainy season the flow is a good many hundred gallons a minute, it is quite a large stream, draining a great district.

Q. Now do you know the distance from Lockport to Robey street?

A. I never measured it, I think it is 30 miles.

Q. Now do you know the distance from Robey street by the Chicago river to this outlet in Lake Michigan?

A. No sir, I do not. 4½ miles, simething like that.

Q. Is the course of that river through the city of Chicago, or through the open country?

97 A. Through the city of Chicago?

Q. Entirely?

A. Yes sir.

Q. Now do you know the distance from Lockport on the Desplaines river to the point of confluence, if there is any, of the Desplaines river with any other stream?

A. Where the Desplaines river joins the Kankakee, do you mean?

Q. Well, any other stream coming down there?

A. Besides the Chicago drainage canal, which flows into the Desplaines river, the Illinois and Michigan canal discharges its water into the Desplaines river.

Q. At what point does it come into the Desplaines river?

A. It discharges its waters into the Desplaines river east of Joliet.

ATTORNEY-GENERAL HAMLIN: What river are you speaking of?

A. I am speaking of the Illinois and Michigan canal discharging its waters into the Desplaines river.

ATTORNEY-GENERAL CROW: Do you know how far distant from either point?

A. The discharge is irregular or broken, rather. The Illinois and Michigan canal passes through several turbines, or mills along there, along the shore at Lockport, so that the water is discharged at various points, from Lockport west.

Q. What is that?

98 A. Is used there for power purposes, they have several mills along there, and then running across a portion of the country below the Ninth street bridge in Lockport, to join the Desplaines river, and then further the Illinois and Michigan canal crosses the Desplaines river in Joliet.

Q. In what general direction does the Illinois and Michigan canal run?

A. It runs parallel with the Chicago drainage canal.

Q. Then what would be the direction?

A. From east to west.

Q. What is its western terminus?

A. The western terminus I think are the pumps at Bridgeport.

Q. Where is Bridgeport?

A. That is on the south branch of the Chicago river.

Q. In the city of Chicago, or out of it?

A. In the city of Chicago.

Q. Do you know how long the Illinois and Michigan canal has been open?

A. I do not.

Q. Now, how far from the Chicago drainage canal is it down to the exit of the Illinois and Michingan canal on the south branch of the Chicago river?

A. I don't know how many blocks, a few blocks.

Q. Now, gòing on down the Desplaines river, does it have 99 a confluence with any other stream of water below Joliet?

A. Below Joliet it joins the Kankakee.

Q. How far below Joliet?

A. I don't know exactly.

Q. Well, do you know anything of the size of the Kankakee river?

A. In flow of water, I do not.

Q. Do you know anything about its width?

A. I did have the figures somewhere, but I cannot remember them.

Q. Now you have got the drainage canal, the Desplaines river, and the Kankakee river, and the Illinois and Michigan canal all into one body of water?

A. Yes sir.

Q. Now, passing on what is the next stream, if any that these waters join with?

A. There are several rivers which join the Illinois, the Vermilion is one of them.

Q. Do you know anything of the size of it?

A. No sir, I do not.

Q. Any other stream?

A. Yes, but I have forgotten. I do not remember the typography of the rivers that come in there, nor how they come in. That is in my report, though.

Q. Do you know how far it is to where they join the Illinois river?

A. Where the Kankakee and Desplaines river come together? 100

Q. Yes.

A. I am not so sure, but I think it is 9 miles below Brandon's bridge. That would be 14 to 16 miles below Joliet, but that is mere guessing.

Q. Do you know how far it is from Lockport to the Illinois river?

A. I would make it about 26 miles.

Q. Well, now do any streams come into the Illinois river after it is joined by the waters of the drainage and the Michigan canal, and the Kankakee and the Vermilion river, and the Desplaines river, prior to its exit into the Mississippi?

A. Yes, the Illinois and Michigan canal again empties into this stream at LaSalle.

Q. Any other body of water come into it?

A. Yes, there are several rivers that discharge into the Illinois river—you mean between Peoria, and down where it empties into the Mississippi river?

Q. Yes.

A. Yes, there are some eleven streams, I believe, in all.

Q. Do you know the names of them?

A. I do not.

Q. You don't know anything about the volume of water?

A. No sir.

Q. Do you know anything of the size of the Illinois river at the point were it joins the water of these three canals, the Desplaines, the Kankakee and Vermilion rivers?

A. I didn't understand the question.

Q. Do you know anything about the size of the Illinois river at the point of conjunction with these other streams you have mentioned?

A. No sir, none other than what the government report gives us. I have been on these rivers. I know the character, about how wide they are at certain seasons of the year depending on the flood volume of the river. 101

Q. At the ordinary stage of water, do you know anything about it?

A. About a half a mile wide.

Q. Do you know anything about the depth?

A. It is a shallow river there and the depth is maintained by the dams that are thrown across it at various places.

Q. For the purpose of aiding navigation?

A. Yes sir.

Q. How far up is it navigable?

A. It is navigable I think—we sent one small boat up to LaSalle.

Q. How far is that above the mouth?

A. Nearly 200 miles.

Q. Is there any town at the mouth of the Illinois river?

A. Grafton.

Q. Is that right at the mouth?

A. Yes sir.

Q. Now what stream does it join there?

A. It joins the Mississippi river.

Q. Do you know whether there is now, and was at the time
of the institution of this suit, on the 23d of January, 1900,
102 any cities or towns on the Illinois or Desplaines river or
the Vermilion river or any of the streams that are contributory thereto, below the point where the Chicago drainage canal enters the Desplaines river, that empty sewage, discharge it from the sewer system, into any of these streams?

A. I know that Lockport and Joliet and Peoria—most of the towns along the river that have any sewage supply whatever, discharge the sewage into the river.

Q. How large is Lockport?

A. Lockport is not very much of a town, I don't know how many inhabitants it has.

Q. Have you any idea?

A. I should say from looking at the town it had 400 or 500 inhabitants.

Q. That is 29 miles from Chicago?

A. Yes sir.

Q. That is, at the point of confluence of the drainage canal with the Desplaines river?

A. Yes sir.

Q. Is there any dam or trap at that point?

A. Yes, at the end of the drainage canal they have what they call a bear trap dam, at that point.

Q. Describe what that dam or trap is, the structure?

A. Well, at the end of the drainage canal they have sluice gates, gates that can be raised and lowered through which
103 the water can be discharged, and then a dam known as a bear trap dam, which is extremely ingenious as a piece of mechanism, over which the water can be discharged by the lowering or raising of the gate.

Q. Well, can the volume of water that flows from the canal into the Desplaines river be enlarged or diminished by means of that trap?

A. By the raising and lowering of that dam, yes.

Q. Can it be so diminished as to exclude the water from the canal entirely?

A. Yes, it can be raised above the water level of the canal.

Q. Well, then it is really a controller of the volume of water from the canal into the river?

A. Yes sir.

Q. Now what is the distance, if you know from Grafton, the mouth of the Illinois river to the present intake of the St. Louis water works?

A. About 30 miles.

Q. When was the present intake of the St. Louis water works located?

A. It was located at—

Q. When was it located?

A. Just exactly when it was put there I don't know, but the pumps were put in action up there in 1895 pumping water
104 at that point.

Q. Now are you familiar with the St. Louis intake?

A. Yes sir.

Q. The construction, etc.?

A. Yes sir.

Q. Just describe it, what it is, and how the water is got from the river into the intake tower, and from there into the pipes, and finally to the consumer in the city.

A. Well, in the river 1500 feet from the shore is built—

Q. In what river?

A. The Mississippi river. On the Missouri side of the river, 1500 feet from the shore is built a large tower—

Q. What is it built of?

A. It is built of stone. Connecting with that tower there is a tunnel in the river.

Q. In the bed of the river?

A. In the bed of the river to the shore. It runs alongside of what is known as the Chain of Rocks. The Chain of Rocks, put out there to deflect the flow of the river away from the Missouri shore. The water passes down through openings in this tower into the tunnel; from the tunnel it runs into what is known as the uptake and reservoir there, and from there to the pumps or to the reservoir, from which the pumps pump the water into large reservoirs, six in number. After settling in these reservoirs, the water is allowed to rest in these reservoirs from 24 to 48 hours, generally 36 hours. It passes out into a
105 conduit and is carried to St. Louis. On the way it meets the
pumps at Baden, the high service pumps there, and the water at that particular point is pumped into what is known as the high surface tower which is located on Grand avenue and Lafayette avenue. From there it is distributed throughout the western part of the city, and the high portions of the central portions of the city. The remaining part of the water passes on to Bissel Point, and there passes into reservoirs, and rests for a time in the reservoirs, to pass from the reservoirs into a series of low service pumps which supply all this part of the city, the low part of the city, the central part of the city.

Q. What is the distance from the settling basins where the water is pumped into the first conduit down to the city of St. Louis, at Baden?

A. I think it is six miles to Baden and eight miles to the low service pumps or low service reservoir at Bissell Point.

Q. What distance is it from Baden down to the high service point, to the reservoir?

A. From Baden to the high service reservoir, I suppose it is three or four miles.

Q. What is the distance down to where the low service basins are located?

A. The distance from where?

Q. Well, from Baden?

106 A. Two miles.

Q. Now what is the size of the tunnel that runs from the tower in the river to the shore?

A. I don't remember exactly, I think it is an eight foot tunnel.

Q. Do you know the depth of that tunnel below the body of the river?

A. I do not.

Q. Is that tunnel walled?

A. Yes sir.

Q. What with?

A. Stone and brick.

Q. Is there any filtration plants or processes anywhere that the water passes through or over between the time that it enters the tower in the river up to the time that it goes out in the service pipes, the low service and the high service stations direct to the consumer?

A. No sir.

Q. No processes whatever?

A. Well, the subsidence that occurs while the water is resting in the reservoirs at the Chain of Rocks is the only treatment whatever that the water receives.

Q. Is there any sand or rocks or other things placed in there?

A. No sir.

Q. No filtration scheme whatever?

A. No sir, no filtration scheme whatever, it is merely subsidence. 107

Q. What is the size of these basins?

A. They are very large, I don't remember the size, I have that in my report.

Q. Do you know whether or not the tower in the river is at a point where the main channel of the Mississippi river is?

A. Yes, it is in the channel.

Q. In what is known as the channel at that place?

A. Yes sir.

Q. Do you know the width of the river at that point?

A. Exactly, no. In the ordinary stages of the river I would say it was a mile across.

Q. At that point?

A. Yes sir.

Q. Now how far from the water tower in the river, if you know, is it to the point of conjunction of the Mississippi and the Missouri rivers?

A. Eight miles.

Q. How far would it be from the conjunction of the Missouri and Mississippi rivers with the conjunction of the Illinois and Mississippi?

A. About 24 or 25 miles.

Q. Now you testified on yesterday that all fecal matter of man or animal contains what is known as bacillus coli communis?

A. Yes sir.

Q. Now will you please explain so I can get it into the record, in shape so we can understand it, we are not scien-
108 tific men, what you mean by the term fecal matter from animal or man.

A. It is the intestinal contents discharged from man, from the bowels of man and animal.

Q. Now is this character of bacilli found anywhere else?

A. Found in nature anywhere else?

Q. Yes?

A. We find it in animals, as I say and we find it also in fish.

Q. Was it ever found in fish prior to your investigation?

A. I have been unable to find any reference whatever that shows that it has.

ATTORNEY GENERAL HAMLIN: Are you speaking from the books, or are you speaking from your own investigation?

A. I undertook this investigation in July 1899 Of course I looked up the literature at the time, and found that no worker anywhere had gone into this subject.

MR. DRENNAN: Of fish?

A. The intestinal contents of fish, yes sir. There has been a good deal of work done since then, since we reported our result.

ATTORNEY GENERAL CROW: Well, did you find that bacillus in the waters of the drainage canal, the Desplaines river, the Illinois river and the Mississippi river?

A. Yes sir.

Q. What, if anything does the presence of that bacillus, 109 in running waters indicate in streams?

A. It has been looked upon by bacteriologists as the index to fecal pollution.

Q. Now explain what you mean by that?

A. Whenever these micro-organisms have been found in water the conclusion is reached that the water must contain sewage, either from the intestinal contents of man or animals.

Q. And it is an indication of sewage in water?

A. Yes, sir.

Q. I will ask you to state whether there is any other bacillus that is found in running streams that is an indication also of sewage in water.

A. There are several, but there really is no good index. There are micro-organisms that are found in sewage steadily wherever sewage is present, they are present in large numbers, but a true index to fecal pollution, I don't know a single one.

Q. Now do you mean to include in that statement the bacilli that we have been talking about?

A. Yes sir. That is, previous to our work upon the intestinal contents of fishes, these micro-organisms were really looked upon, and I believe it is still held by Prof. Jordan, looked upon as an index to fecal pollution, but our own experience robbed it of that dignity.

Q. Well, what reason do you assign for that?

A. What is that?

Q. Why is that?

A. Why, if it is found in a stream steadily, and we know that there are fish in the stream at the same time, which
110 have it in their intestinal contents, and are discharging it from their intestines, then the bacillus coli-communis found in that particular water may be either from sewage, from man, or from animals, or fish.

Q. Now you found it, you say, in fish?

A. Yes sir.

Q. Where did you find the fish that had this bacillus?

A. In the Illinois river.

Q. Did you investigate the intestinal portions of fish in the Mississippi rver?

A. Yes, sir.

Q. Did you find it there?

A. Yes, certain kinds of fish, carp for instance.

Q. Did you find it in the fish of the Missouri river?

A. I am not sure, I think not. I am not so certain about that, but I think very rarely, if at all. I have got the exact figures here, if you care to have me refer to them to refresh my memory.

Q. Did you investigate the fish in the canal, the Chicago drainage canal?

A. Well, whatever fish we found there were dead. We didn't go into their intestinal contents at all.

Q. What was the reason of that?

A. Well, they were dead, killed by the fact that the
111 micro-organism used up the oxygen of the water.

Q. What micro-organism do you refer to?

A. All the aerobic micro-organism.

Q. You mean by that the micro-organisms that are present in sewage polluted water?

A. Well, organisms are present in any water that is freely exposed to the air, but the water of the Chicago drainage canal contained large numbers of bacteria, and the oxygen consumers consumed the oxygen that was in the air in the water. That leaves the water without air for the fish to breathe, and having no air to breathe, they die.

Q. What was the direct cause of the immense activity of these micro-organisms?

A. So many of them there.

Q. What was the cause of their presence in such great numbers?

A. Sewage.

Q. Where there were lots of sewage there would be lots of these bacteria?

A. Yes sir.

Q. And that is the reason that fish cannot exist in the drainage canal?

A. Because the bacteria consume the oxygen that is in the air, in the water.

Q. Do fish exist in the Desplaines river?

112 A. I saw men fishing there, I don't know whether there are any fish there or not.

Q. You caught no fish there?

A. No sir.

Q. You don't remember the number of fish you examined?

A. I think it was 68.

Q. During what period of time was that?

A. Extending over several months.

Q. In what year?

A. 1900.

Q. Did you make any investigations after that?

A. I should have said 1899 and 1900. No, not after that. It is very tedious business.

Q. Now you say in July, 1899 that you were city bacteriologist, consulting bacteriologist for the city of St. Louis.

A. Yes sir.

Q. How came you to go to investigating the water supply for the city of St. Louis?

A. I was instructed by the Health Commissioner to get the necessary apparatus and go to work to ascertain the bacteriological contents of the Mississippi river at the intakes of the

St. Louis water works, and also to examine the waters of the Mississippi river between the mouth of the Illinois and the intake, the Missouri river water and the Mississippi river water, and the waters of the Illinois river above the conjunction.

Q. Do you know what caused the Health Commissioner
113 to give you that order?

A. I know there was a great deal of talk about the Chicago drainage canal.

Q. I don't refer to that, I mean any official authority for it.

A. Yes sir. The reason was this. We have to speak about the Chicago drainage canal because that canal was to have been opened, it was nearing completion—

Q. You don't catch the point of my question. Was there any official action by which the Health Commissioner—

A. Yes, there was a motion I believe introduced into the city council and house, by which the city counsellor was empowered or instructed to have these examinations made, and he directed the Health Commissioner to have the bacteriological department do it.

Q. That was the cause of your action?

A. Yes sir.

Q. That's what I wanted to get at.

A. Yes sir.

Q. Now this suit was permitted to be filed on the 22nd day of January, 1900; prior to that time, between that date and July, 1899, had you made any investigation of the waters of the Mississippi and the Illinois rivers?

A. Yes sir.

Q. And the drainage canal?

A. Yes sir.

Q. Do you remember the date on which you first began
114 that investigation?

A. Well, we were instructed July 23d, I think, and we began work on August 10th, 1899.

Q. Did you establish any laboratory at any place?

A. We established a temporary laboratory at the Chain of Rocks.

Q. What was the character of the work that you carried on, was it chemical or bacteriological?

A. Bacteriological.

Q. Wholly?

A. Yes, wholly.

Q. Now beginning on the 10th day of August, 1900, what was the nature of the examinations that you carried on and at what point did you carry them on up to the 30th of August?

A. In 1899 we established a temporary laboratory, had an ice chest in it, and a frame for plating.

Q. You have got some memorandum there that you can refresh your memory from as to the dates, so there will be no question as to the dates.

A. Well, that was on August 10th, 1899 that the temporary laboratory was established at the Chain of Rocks, in a small building.

Q. Now where was the Chain of Rocks?

A. The water works at the Chain of Rocks.

Q. The intake towers?

A. Yes. In the Mississippi river, the Missouri shore.

115 Q. Now what was the nature of those investigations you made from the 10th of August to the 30th of August, 1899?

A. It consisted in the examination of the water at and around the intake to find the number of bacteria per cubic centimeter in it and beside several boat trips were made up the river taking samples around the intake, the Missouri river, the Mississippi river at several points between the mouth of the Missouri and the mouth of the Illinois, the Illinois river and the Mississippi river above the mouth of the Illinois.

Q. Well, you took samples of water from the river?

A. We took samples of water, yes sir.

Q. In what quantity did you take the water?

A. We took about a hundred cubic centimeters in a bottle, 4 oz. bottle.

Q. How much would that represent?

A. About 4 ounces.

Q. What did you do with that water?

A. That water was taken with a special apparatus designed by us in sterile vessels, from about 3 feet below the surface of the river. These samples were immediately taken ashore, when they were taken at the intake or at the uptake, and plated at once or when a sample was taken on the boat, a skiff pulled out from the boat and secured the water, and it was taken and covered and kept cool and taken right back to the boat and plated immediately.

Q. Now explain what you mean by sterile, you say the
116 vessels were sterile?

A. I said that we used sterile glass vessels. That brings up the question of sterilization. There are 3 methods of sterilizing vessels. Sterilizing anything by means of heat, we have first what is known as the dry heat method, putting a vessel into an oven and heating it, like baking bread.

Q. Now what is the object of that?

A. It is to kill the bacteria on or in the vessel or in the fluid in it. The temperature must be from 150 degrees to 170 degrees Centigrade and this must be continued for an hour and a half.

Q. What does that represent in Fahrenheit?

A. Well multiply that by 2½ practically.

Q. Multiplying that by 2½ would be about 350.

A. Yes sir, and it must be maintained at that temperature for an hour and a half. So our glass vessels then, were put into an oven and heated for an hour and a half at a temperature of 150 Centigrade. The Thermometer or thermo-regulators were regulated to do that. At the end of that time they were taken out and set aside. Now then there is the method of sterilization by steam. We have a vessel closed in which the steam can be generated but can escape through cracks in it. The temperature is brought to the boiling point of water which generates steam, and the temperature then reaches 100 centigrade 212 Fahrenheit. In this moist atmosphere, in this steam, bacteria
117 are destroyed in a comparatively short time, but the spores
retain their vitality for a great while so if we wish to heat the media, say continuously, we can do so by this temperature, but we must continue the process for an hour or to an hour and a half, depending on the bulk of the material and the steam

sterilizer. Our gelatine and nutritive media are heated discontinuously, that is, we heat it for about half an hour, at this temperature, 100 centigrade, in the steaming steam, the first day, the idea being to kill all the bacteria that do not contain spores and besides not injuring the gelatinizing quality, say of gelatine, for gelatine heated too long will not jell harden. Then the material is allowed to stand, the hope being that the spores which may be present, will take the hint and grow out into bacteria, and the moment they have passed from the spore stage into bacillus, why they are tender and easily killed, so on the second day the material is again sterilized for 20 minutes and allowed to rest for 24 hours and again heated on the third day, so three days of discontinuous sterilizing is necessary. Now then, we have another method, of steam under pressure. We have an apparatus a chamber that can be sealed and with a Thermoregulator in it we can raise the temperature to any degree we please under any pressure, but the idea is to raise the temperature to 115 degrees centigrade, that is a pressure of 1½ atmospheres, making about 23 lbs. in all, so with such an
118 apparatus, with a pressure of 1½ atmospheres and a temperature of 115 degrees centigrade, the bacteria are killed, spores and all in from 15 to 30 minutes. All our material were always heated 30 minutes. That assured not only the death of the bacteria, but all the spores in the media, no matter how bulky the material in the steam sterilizer. Is that plain?

Q. Yes. Now you have an apparatus you designed yourself for taking these samples of water?

A. Yes sir.

Q. Describe that.

A. Why a look at it is sufficient, but the idea is this. An apparatus was to be constructed that would hold a bottle snugly so that it cannot escape or could not escape when it was plunged beneath the running water. First we had a frame constructed and a method of holding the bottle snugly. That frame had a handle to it. That handle was hollow, down through the handle ran a rod, on the end of that rod was a clamp, which clamped to the cork of the bottle, on the other end of that rod was a ring, now when it was desired to open the bottle, all you had to do was to pull on this rod which ran down through the hollow handle of the apparatus and that lifted the cork out, allowing the water to run in to the bottle and a little spring forced the cork back into the bottle. The apparatus was designed and made in the water works blacksmith shops, and afterward adopted by the bacteriologists of the Chicago drainage canal.

Q. Now was that apparatus used in taking the samples
119 that you have bacteriologically examined in this work?

A. Yes sir.

Q. Now are there any particular rules or methods adopted generally by bacteriologists in this country, in the examination of water and other things for the discovery of bacteria?

A. Yes sir.

Q. Will you tell about what they, are, please?

A. In the first place, there is a sterile vessel.

Q. Well, in the first place, is there any organization in this country that has adopted a scientific method?

A. Yes. The American Public Health Association. The bacteriological committee of the American public health association, of which I am a member, have published a report, which is here. This is the first report published. It was in 1898 and is called "Procedures recommended for the study of bacteria, with special reference to a greater uniformity in the description and differentiation of species."

"Being a report of a committee of the American Bacteriologist to the committee on the pollution of water supplies of the American Public Health Association, submitted at the meeting of the Association in Philadelphia September, 1897, published by the Rumford Press, 1898."

Q. Does that outline the method that is approved by
120 bacteriologists generally?

A. Yes sir, bacteriologists in this country. Uniformity is the idea.

Q. Have these methods or rules ever been amended or Altered in any way since that date?

A. At a meeting in 1901, I think, the whole subject was gone over again and a few changes made in some of the details of preparing media.

ATTORNEY GENERAL HAMLIN: Give me the name of that volume?

A. (witness hands Mr. Hamlin the volume last referred to).

ATTORNEY GENERAL CROW: Have you more than one copy of that?

A. This is the only copy I have, but it is published also in the reports of the American Public Health Association.

Q. Could we get a copy of that report?

A. Yes, we can easily get it from the secretary of the American Public Health Association.

MR. CROW: I will put it in the record, if you have no objection gentlemen. As a matter of information I would like to have it go to the court.

MR. HAMLIN: We will decide later on. You go ahead and ask him about these matters.

MR. CROW: Now, in your bacteriological work, from first to last, what methods did you follow in making these examinations?

A. Well, now, I say we designed that apparatus, then we had—

Q. Now wait a moment, you don't catch the point of my
121 questiion. Did you or not follow the method—

A. We followed the methods there laid down, yes sir. For the preparation of media throughout.

Q. Now just indicate where. When you say "where" the record does not disclose what you mean.

A. I say, we made a media, according to the methods laid down by the bacteriological committee of the American Public Health Association.

Q. Now just describe the method you followed again in making these examinations?

A. Do you want me to collect these samples first?

Q. Yes.

A. The collecting apparatus, I described that. Now then the sample was collected 3 feet below the surface, in a sterile wide mouthed glass vessel.

Q. At what point in the stream?

A. At the intake, that is, outside. We collected it at the

intake in the river outside of the intake, on the Illinois shore, and in the uptake, in the well of the uptake. The difference between the water flowing in 1500 feet from the river in the tunnel to a well was not shown bacteriologically. The number of bacteria flowing into the intake and flowing into the uptake were the same. It is practically the same water, no bacteria lost in travelling 1500 feet, so instead of sending a man out in a boat, that is, a bacteriologist out in a boat, every day,
122 we took the water from the uptake, where it runs out of the long tunnel, a series of experiments showing us that the number of bacteria at both points were the same. That was one set. Then the other sets of samples were collected up the river at various points, which are recorded in my report on page 4. Now about this report?

Q. Well, you have there the figures, have you?

A. Yes, I have the figures here in a report which I made to the city counselor, and also have those in the books recorded in sequence taken at that time. Now which one do you want at the present time?

Q. Wait a minute until I get to that. After you took those samples of water, what did you do?

A. Brought them directly to the shore. They were then taken to this room I spoke of in the little building at the chain of rocks, and immediately plated. I should say first, immediately put on ice and then preparations made for the plating.

Q. What do you mean by plating?

A. By plating we mean this: a definite quantity of the water is taken, one cubic centimeter.

Q. That is, about 16 to 20 drops?

A. Yes, about 16 to 20 drops of this water. It is mixed with gelatine. The medium that we speak of, the gelatine medium, containing 10 per cent. of gelatine and having a reaction of 1.5 per cent. to phenol phthalein. Now with this medium, it is mixed in a tube and poured out in what is known as a petri dish.

123 Q. Now what is a petri dish?

A. It is a dish about 4 inches in diameter, with a flange upon it, and on top of that fits a cover with a flange, so that one sets snugly over the top of the other. Into a sterile dish of this kind is poured the water mixed with gelatine. That is put in the ice chest, kept at a temperature of 20 Centigrade, about 60 Fahr., and the bacteria allowed to grow. The plates are watched and at the end of two or three days, three days as a rule, the colonies which have formed are counted.

Q. You mean the colonies of bacteria?

A. Yes, and each colony is considered one bacterium. The number is then recorded. Now for each sample of water we made from two to three plates.

Q. Now that is the process you went through with those samples?

A. Yes sir, that is the process of making plates to get at the number of bacteria in each sample of water.

Q. Now this investigation was only to determine the number of bacteria without regard to a classification thereof?

A. Yes sir, no attempt made to classify at that time.

Q. And the result of these investigations simply gives the unclassified number of bacteria?

A. Yes. Besides that we carried out some work identifying the number of bacillus coli communis in sterilized water collected at these points. 124

Q. Will you name the points where these collections were made and the dates?

A. Yes sir. The Mississippi river just above the intake of the St. Louis water works, August 10, and August 30, 1899.

Q. Now give also the dates, Mr. Ravold, or rather the result that is, the result, the total number of the bacillus coli communis or of the total number of bacteria.

A. The total number of bacteria without the coli?—I wish to say that this is the average of two or three plates, this number represents the amount, 300 on one plate and 350 on another. I have added together and divided, making 325.

Q. So the number represents—

A. The mean.

Q. Not less than the two plates?

A. The two plates always. Sometimes a plate is liquified and lost.

Q. So it always represents a total of from 20 to 25 drops?

A. Sometimes a plate is liquefied too rapidly to get at it, to count the liquefied colonies in it and then only one plate is taken, but that is generally recorded in the book. Now do you want me to go on? The Mississippi river just above the intake August 10,—275 bacteria.

ATTORNEY-GENERAL HAMLIN: This is per cubic centimeter?

A. Yes sir. August 30, 275, same place.
September 12, 650 bacteria.
125 September 13, 1500 bacteria.
September 15, 2300 bacteria.
September 16, 1700 bacteria.
September 20, 1200 bacteria.
September 25, 3600 bacteria.

MR. DRENNAN: This is in 1899?

A. Yes sir. The collection of the sample of the Illinois side of the intake, that is toward the Illinois shore—

MR. CROW: But immediately adjacent to the intake?

A. Directly in line with it. When the samples were taken, that was on the 23d of August, at that point, the number of bacteria was 240. Now then, in the intake, as the water flowed into the intake, the samples were taken there. On
August 10, 500 bacteria.
August 21, 375 "
August 22d 950 "
August 23d 550 " That is all for that point. Now then,
the uptake. After the water had flown from the river through
the tunnel and discharged into the uptake, a sample of water
was taken from the uptake. From the tower to the shore is a
tunnel, and when it flowed out of the end of the tunnel, 1500 feet
from the river, a sample was taken there. As I say, we
126 found no difference in the numbers in the intake and the
uptake,
August 10, uptake, 600
August 11 " 650
August 12 " 650
August 14 " 650
August 15, " 1500

August 17, uptake, 750
August 18, " 650
August 19, " 400
August 21, " 325
August 22nd " 150
August 23d, " 1300
August 24, " 475
August 25, " 400
August 26 " 275
August 28 " 275
August 29 " 170
August 30 " 300
Sept. 4 " 300
Sept. 5 " 270
Sept. 11 " 300. That's all. Now then, do you want the result of the boat trips?

Q. Now how many trips were made between August and January 23d?

A. Six.

Q. Now to what points were they made?

A. They were made up the river in the harbor boat.

Q. Up what river?

A. Up the Mississippi river in harbor boat to the mouth of the Missouri.

Q. As far as what point?

A. In the Illinois we went as far as the brick house club,
127 5 or 6 miles up the river; and 2 or 3 or 4 miles up the Mississippi river, above the conjunction with the Illinois river and collected samples at different points.

MR. DRENNAN: That is, in 1899?

A. Yes sir.

MR. CROW: It extends up to January 23d, between August and January 23d, 1899 is the period of time that was covered, isn't that right, doctor?

A. Yes sir.

Q. Now do you know how many samples of water were taken?

A. In these boat trips and all?

Q. Yes.

A. I can count them—32.

Q. Before you begin to explain about these trips, will you explain what you mean by coli work in bacteria?

A. I find 32 samples collected. Now in order to detect colon bacillus in the water several procedures have been recommended. We have developed—

Q. What do you mean by colon bacillus?

A. The same as bacillus coli communis. It is the same micro-organism, but we speak of it in the laboratory in that way for brevity. The colon bacillus in the presence of sugar produces fermentation, it breaks up the sugar, producing
128 gases. Now if we can put sugar broth into a U tube closed at one end known as a fermentation tube, and have the closed arm filled with broth and the open arm made so that we can put water into it, if the bacillus coli communis present in the water, it will break up that sugar and form gases in the closed tube. The gases of course collect at the top and force down the broth. Now it produces as a rule about 60 per cent. of gas in the tube, when we put a small quantity of water in the fermentation tube and 40 to 60 per cent. of gas forms sometimes, 75 per cent. we know there is a gas producing bacillus there, and then we merely search for this gas producer by plating and studying the colony characteristics of the micro-organism that we think produce this gas. That micro-organism is picked off and shown on a variety of media. Its microscopic form studied, and its growth characteristics on quite a number of media and its motility.

Q. What do you mean by Motility?

A. Meaning whether it swims or not in a fluid.

Q. Now is that the character of coli work that is described which was carried on on these boat trips?

A. No, not on all the boat trips. Samples were returned to my laboratory in the city chemists office, and there these experiments were carried out. It took some time to get the department going, and I did that work myself.

Q. Do you know at what point on the river, in these boat

129 trips, in the Illinois and Mississippi Rivers that samples were taken, and the dates?

A. Yes sir.

Q. Have you the result of that examination?

A. Yes sir.

Q. Now the result, as you give it, would be simply the number of bacteria unclassified?

A. Yes sir. September 6, Illinois River,—at what is known as Wheeler's ferry, three miles above the mouth, 130 bacteria.

Illinois River, five miles above the mouth, Grafton, at what is known as Brick House Club, 170 bacteria.

The Illinois River seven miles above Grafton,—at what is known as six mile Island, 160 bacteria. Now then we go over to the Mississippi River.

MR. DRENNAN: The same day?

A. The same day. Mississippi River opposite Grafton, 190 bacteria.

Mississippi River four miles above Grafton, 550.

Mississippi River 6 miles above Grafton, 276.

All the above samples were plated on the harbor boat immediately after collection.

On September 9th, we made another trip. Mississippi River, —Chain of Rocks, 160 bacteria.

Mississippi River,—Madison landing, that is above the mouth of the Missouri River, just above, 210.

Missouri River near the mouth, just above the mouth, 180.

Mississippi River, one and a half miles below Alton, that 130 is, in the channel, 190.

Mississippi River one mile above Alton, 240.

Mississippi River, one mile below Grafton, 160.

Illinois River just above Grafton, 90.

Mississippi River opposite Grafton, 150.

That's all on September 9th.

September 16th, Mississippi River, Chain of Rocks, 1700.

Mississippi River, Madison landing, 800.

Missouri River, near the mouth, 2600.

MR. SPRINGER: Is that above the mouth or below?

A. That is above the mouth of the Missouri.

Mississippi River two miles above the mouth of the Missouri, 700.

Mississippi River one and a half miles below Alton, 800.

Mississippi River one mile above Alton, 700.

That's all that day.

September 21, Illinois River one and a half miles above Grafton, 450, and the bacillus coli communis, present. Now bacteriologists marks a bacillus coli communis positive or negative. They mark it with a cross if the bacillus coli is present, and if it is not present, it is marked "minus." Zero means sample not examined for coli.

Illinois River one and a half miles above Grafton, 450 bacteria, and the bacillus coli communis present.

MR. SPRINGER: What do you mean by the word "present?" 131

A. I mean that it was a positive reaction; that it showed the coli communis were present in the sample. I found bacillus coli communis in it.

Q. That is September 21, 1899?

A. Yes sir.

September 21, three miles above Grafton, 400 bacteria and the bacillus coli communis present.

Illinois River five miles above Grafton, 425 bacteria bacillus coli communis present. Now we go to the Mississippi.

Mississippi River one mile above Grafton, 500 Bacillus coli communis absent.

Mississippi River four and a half miles above Grafton 500 bacteria to the cubic centimeter. Bacillus coli communis present. That's all on that date.

September 25, Mississippi River, Chain of Rocks 3600. Bacillus coli communis present.

Mississippi River, Madison Landing, 750 bacteria coli absent. Missouri River, near mouth, that is, just above the mouth, 5600 bacteria to the cubic centimeter. Bacillus coli communis present.

Mississippi River, half way between Alton and the mouth of the Missouri, 750 bacteria. Bacillus coli communis present.

Missouri River, opposite Clifton, 750 bacteria. Bacillus coli communis present.

Mississippi River, half a mile below Portage—

MR. SPRINGER: Where is that?

132 That is above Alton. It is a place called Portage, where the Indians used to carry boats across to the Missouri River.

Q. What is the number?

A. 600. Bacillus communis coli absent. That's all.

MR. CROW: Now between September, 1899, and January 23, 1900, were there any bacteriological investigations carried on by you to determine the presence of these coli communis in the waters of the Mississippi?

A. Between what dates?

Q. Between September, 1899 and January 23rd, 1900—in the Mississippi River and Illinois River other than what you have mentioned?

A. No sir.

Q. Now do the investigations you have stated cover bacteriologically all the work you did in the period of time from August 1899 to January 23rd 1900?

A. All that was done is here recorded.

Q. This work was done under your personal supervision?

A. This work was done under my personal supervision. The media made in my laboratory, City Chemists' office, and the plating done at the Chain of Rocks, and I did the coli work personally.

Q. Now beginning on the 23rd of January, 1900, can you tell me how long prior to that date the Chicago Drainage Canal was formally opened?

A. Six days prior to January 23rd.

Q. Now do you know when the Bear Trap dam at Lock-
133 port that you have described was raised?

A. Or lowered so that the water could flow?

Q. Yes, or lowered?

A. I understood that was January 17th and I have so recorded it in my report.

Q. Well, the lowering of that dam would mark the entry of the waters of the canal into the Des Plaines River?

A. Yes sir.

Q. Now, to go back a little bit. Are you acquainted with the natural course of the Chicago River and the place into which it would naturally drain?

A. Yes sir.

Q. What would be the general course of the flow of that stream?

A. It would be towards the Lake.

Q. Well, in what direction would that be?

A. That would be east.

Q. And into what Lake?

A. Into Lake Michigan.

Q. What is the general course and the natural watershed of the Des Plaines River?

A. The Des Plaines River watershed discharges its waters toward the west into the Mississippi River valley.

Q. Then there must be a natural divide between the waters of the Des Plaines River and the Chicago River?

A. Yes sir.

Q. Is there, or is there not?

134 A. Yes sir. There is!

Q. Do you know anything about the elevation of that divide above the level of the two rivers?

A. I do not.

Q. Do you know anything about the current of the Chicago River with reference to whether it was rapid or slow as it flowed naturally into Lake Michigan?

A. I did, depending upon the flood volume.

Q. At the ordinary stage of water?

A. It was a very feeble current towards the Lake, and in fact most of the time it was stagnant.

Q. Do you know how many branches of the Chicago River there are?

A. I knew there were two branches, the north and south branch.

Q. Do you know whether there are any others?

A. Well the small branches that discharge into the south branch. That south branch and west branch. I know nothing very much about the North branch.

Q. Do you know anything about the size of the Chicago River from Robey Street into the Lake?

A. No, I don't know the exact size. I know they are trying to make it 160 feet.

Q. Well, prior to this opening of the canal?

A. No, I do not.

Q. Do you know anything about its depth?

A. No sir.

Q. Well that was used somewhat for harbor purposes
135 near its mouth?

A. Yes sir.

Q. Now do you know in what direction the Chicago River flows at this time?

A. The Chicago River flows west.

Q. Since what period has is flowed west?

A. Since the opening of the Chicago Drainage Canal.

Q. What was the cause of the reversal of the current?

A. The discharge of the water over the Bear Trap Dam at the controlling works at Lockport.

Q. Well, what caused that water to be discharged there?

A. Because the dam was lowered below the level of the Lake.

Q. Below the level of the Lake?

A. Below the level of the water in the Lake.

Q. Now do you know who constructed the Chicago Drainage Canal?

A. I don't know.

Q. Do you know the object of its construction?

A. Well I heard it was for a ship canal. The Health Commissioner of Chicago told me that.

Q. Do you know for what purpose it has been used since its opening?

A. It has been used as an open sewer.

Q. For what city?

A. Chicago.

Q. Have you any knowledge of the amount of sewage that
136 has gone into it since its opening?

A. I have not, none other than the figures obtained from Mr. Reynolds.

Q. Who is Mr. Reynolds?

A. The Chief Engineer,—Randolph, isn't it? Mr. Randolph was kind enough to give them to me.

Q. The chief engineer?

A. The amount of water discharged from the dam and some figures in regard to the amount of sewage discharged into it.

Q. That is, the Chief Engineer of what?

A. Of the Chicago Drainage Canal.

Q. The Chicago Drainage Canal or the Chicago Sanitary District?

A. I don't know the distinction.

MR. SPRINGER: The Sanitary District of Chicago official designation?

A. It is the Chicago Sanitary District then.

MR. SPRINGER: The Sanitary District of Chicago is the title?

A. He is the chief engineer of that.

MR. CROW: Have you got those figures with you?

A. I have not. They are in the hands of Dr. Teichmann.

Q. From whom did he get them?

A. From the Chief Engineer of the Chicago Sanitary District—of the Sanitary District of Chicago.

Q. Do you know anything as to the volume of water that
137 passed into the Des Plaines River from the Chicago drainage canal at is opening?

A. At its opening at the time?

Q. Yes?

A. No, I do not, but I understood though there were something like 300,000,000 gallons in 24 hours.

Q. Do you know the capacity of that canal?

A. That is 300,000,000 cubic feet in 24 hours; I think those are the figures we got.

MR. SPRINGER: 300,000 cubic feet a minute?

A. Yes sir.

MR CROW: Do you know anything about the capacity of that canal? How much water it can flow?

A. I do not. I know it is a magnificent piece of work, 160 feet across and 38 feet deep through rock.

Q. You never made any estimate of the volume of water that can be sent through there?

A. No sir, that was left to the engineers. They are better able to tell about it than I am.

Q. Well, what enabled the waters of the Chicago Canal and the Chicago River to pass through the natural divide between the watersheds of the Des Plaines and the Chicago river?

A. This ship canal that was cut through this divide.

Q. Well, it is known as the Chicago Drainage Canal?

A. The Chicago Drainage canal, yes sir.

Q. Now what is the effect of that on the waters of the
138 Des Plaines River, whether it increased it or diminished it?

A. It increased it.

Q. What is the character of the banks and the soil along the Des Plaines River?

A. It is an alluvial country,—clay, low.

Q. Is it flat or rolling?

A. Rolling country.

Q. Did the emptying of this water into the stream have any effect as to the widening of it? I mean, increasing the shore line?

A. Well, I don't know that. I haven't been there long enough. I never was there long enough. I don't know the extreme limits of the flow, when the greatest volume of water is running through the Des Plaines. I have seen it at a very low stage. It is constantly adding to the stream—300,000,000 cubic feet of water in 24 hours; that ought to widen up the stream just a little bit.

Q. Well now, beginning the 23rd of January, 1900, did you pursue any bacteriological investigation in the waters of the Chicago Drainage Canal, Lake Michigan, the Illinois River, Des Plaines River and the Mississippi River?

A. Yes sir.

MR. DRENNAN: Beginning with January 23, 1900?

A. Yes sir.

Q. MR. CROW: Well, what was the character of those examinations?

A. We began work on January 23, taking samples from 139 a number of points on the Illinois River, the Mississippi River, the Missouri River and the reservoir at the Chain of Rocks, and studying this water for its bacteriological points, that is the number of bacteria per cubic centimeter; for the detection of bacillus coli communis, and the study of the bacteriological flora of the water. That is the different species found in it; carried out a series of special observations which can be taken up in their order, and also made microscopic study for a time of the water.

Q. Now do you know in a general way the distance up the River from the St. Louis in-take to Lake Michigan, Lockport, Joliet, Peoria, Grafton, Hartford, Alton and Bellefontaine?

A. I have the figures here, taken from the report of the Chicago Drainage Canal people. From Lake Michigan to St. Louis at the in-take, 357 miles.

Q. Is that measurement made from the exit of the Chicago River into Lake Michigan?

A. From the mouth of the Chicago River, yes sir.

Q. From what was the mouth—the source now?

A. Yes sir.

Q. Go ahead?

A. Lockport, 327 miles,
Joliet, 320 miles,
Peoria, 196 miles,
Grafton, 39 miles,
Alton, 23 miles,
140 Hartford, 12 miles,
Bellefontaine, on the Missouri River, 14 miles.

Q. Are all of the points mentioned located in the State of Illinois except Bellefontaine?

A. Yes sir.

Q. Where is Hartford located?

A. It is below Alton.

Q. Just locate Bellefontaine, will you—tell where it is?

A. It is very difficult to locate; it is a little bit of a town where the Burlington Road crosses the Missouri river at Bellefontaine Bluffs.

Q. Well, it is up the Missouri River, four or five miles above the mouth?

Q. That locates it sufficiently?

A. Yes sir.

Q. On the south bank of the river?

A. On the south bank of the river, yes sir.

Q. MR. SPRINGER: What distance did you call it?

A. 14 miles.

Q. MR. CROW: From the in-take to Bellefontaine, and four or five miles up the Missouri?

MR. SPRINGER: Yes.

MR. CROW: Have you any knowledge of the flow of the water from the point of conjunction with the Chicago River and Lake Michigan down to the St. Louis in-take?

141 A. I have been over it.

Q. I know, but I mean the rapidity of the current.

A. That depends upon the volume of water in the River.

Q. Have you ever undertaken to investigate that question?

A. Personally, no sir, except traveling in a boat and swimming against it.

Q. Well, of course it is hardly necessary to suggest that if its volume increases, that increases the flow?

A. Yes sir, the greater the volume of water in the river the faster it flows.

Q. Do you know anything about the difference in the altitude or the difference in the level between the St. Louis in-take at the water works, and Lake Michigan at the mouth of the Chicago River—or what was its mouth?

A. I have the figures somewhere; I think they are in that map you have there.

Q. At the noon recess will you find that?

A. Yes sir.

Q. Now have there been any artificial means of any kind used by any persons or corporations or anyone at any point on the Chicago River to aid in the turning of the natural current of the river?

A. The natural current of the river?

Q. Chicago River?

A. Why yes, this lowering of the dam at Lockport in the Drainage Canal.

142 Q. That is not on the Chicago River.

A. That will run the water the other way.

Q. Well, on the Chicago River is there any?

A. The pumps at Bridgeport.

Q. Where are those pumps?

A. I believe they were originally established to help to purify the River.

Q. In the first place, where is Bridgeport?

A. In Chicago.

Q. In the City of Chicago?

A. Yes sir.

Q. What part of the city?

A. In the Southern part of the city.

Q. Can you describe these pumps, how they operate?

A. I cannot; I never saw the pumps; but I have seen the building. I know they pump the water into the Illinois and Michigan canal, and did that before the Drainage Canal was opened.

Q. Located at a point where the Illinois and Michigan Canal joins the south branch of the Cheiago River; is that right?

A. Yes sir, near there.

Q. That point near Bridgeport?

A. Yes sir.

Q. Now you collected samples of water at Lake Michigan, Lockport, Joliet, Peoria and Grafton, beginning at this period on the 23rd day of January, 1900.

143 Q. Now those samples of water were taken from the water daily or weekly or how?

A. Every day.

Q. Now were they taken from boat or from the shore?

A. They were taken from a boat or a bridge where it crosses the river conveniently. Our instructions were to take it from the channel where the water flowed the most rapidly and deepest—three feet below the surface, with the apparatus designed by us.

Q. Have you any record of the water that you took from Lake Michigan? Just begin there at the point, with Lake Michigan and come down?

A. I have a record of eleven samples.

Q. Now where was this water taken from?

A. Taken from Lake Michigan.

Q. At what points?

A. The four mile crib, Carter Harrison crib. Ten miles from the Chicago shore, Lakeview, 68th Street, 2 mile crib, Lake View, three-mile crib, four-mile crib, 68th Street, four mile crib.

Q. Now have you the dates upon which you took these various samples of water and the amounts you took?

A. Yes sir.

Q. Now beginning with the four mile crib, what date was the sample of water taken there? July 23rd?

144 A. Yes sir.

Q. Do you know what time of day?

A. July 23rd, 11:45 A. M.

Q. What was done with that sample of water?

A. The sample was sent to St. Louis and examined here.

Q. Now was that sample taken from the surface of Lake Michigan or from underneath the surface?

A. From below the surface three feet.

Q. Now do you know where the four mile crib is located with reference to any of the in-takes of the City of Chicago for water supply?

A. That is an in-take.

Q. The four mile crib is one of the in-takes of the water supply of the City of Chicago?

A. Yes sir.

Q. Or was at that time?

A. Yes sir, and is now I think.

Q. Now have you the result of the number of bacteria found in that centimeter of water?

A. Yes sir, 1600.

Q. Now was this bacillus coli communis present or not present?

A. It was found present.

Q. The Carter Harrison Crib; where is that located?

A. Ten miles from the Chicago shore.

Q. In Lake Michigan?

145 A. Yes sir.

Q. Have you given the date?

A. July 30th, 11:30 A. M., 1900.

Q. Have you a record of the number of bacteria found in that sample?

A. 12,300.

Q. Now did you find these coli communis present there?

A. Yes sir, that sample was taken ten feet below the surface.

Q. Do you know what the depth of the water was at that point?

A. No, I do not.

Q. Was there any investigation made at that time to learn?

A. No sir.

Q. How is, what is called the ten mile crib located with reference to any water supply of Chicago?

A. I know nothing about it. First we had the Carter Harrison crib; that was 12,300. Now we have got the ten mile crib; that is what we are dealing with now.

MR. DRENNAN: The Carter Harrison crib is not ten miles out.

A. We are dealing with the ten mile crib, ten miles from Chicago, ten feet below the surface. I suppose that is the same day we went out to the Carter Harrison crib.

Q. There was not a crib ten miles out.

A. Simply ten miles out they got the sample. A place ten miles out, ten feet below the surface. That was taken

146 August 9th, 4:00 P. M. Number of bacteria 16,300. Bacillus coli communis present.

MR. CROW:

Q. Well, in order to shorten the matter we will get you to state if these stations that are called cribs are the general water supplies for the City of Chicago?

A. They are points of in-take.

Q. In Lake Michigan?

A. In Lake Michigan.

Q. That isn't ten miles out?

A. No. On the same day that the Carter Harrison, or rather later, my collector must have gone out that far, because the record made of the Carter Harrison crib says ten miles from the shore and ten feet below the surface. They went out in the Drainage Canal boat.

Q. The next crib you have there is the Carter Harrison crib?

A. The Carter Harrison crib 31st of August, 10:30 A. M., and the number of bacteria present, 21,400. Bacillus coli communis present.

Lake View Crib, September 7, 11:30 A. M.—5200. Bacillus coli communis not found.

Two mile crib, September 15, 10:30 A. M., 909,700 bacteria. Bacillus coli communis present.

Three mile crib, September 15, 11:45 A. M., 111,500. Bacillus coli communis present.

Two mile crib September 22nd, 2:00 P. M., 61,000. Bacillus coli communis not found.

147 Sixty-eighth Street Crib, September 22, 11:15 A. M., 44,000. Bacillus coli communis not found.

Two-mile crib, September 28, 10:45 A. M. Bacteria per cubic centimeter 11,300. Coli communis not found.

Lake View Crib, September 28, 12:15 P. M., 3,100 bacteria. Bacillus coli present.

Two Mile Crib, October 11, 12:15 P. M., bacteria per cubic centimeter, 1100. Coli not found.

Three Mile Crib, October 11, 11:30 A. M. Bacteria per cubic centimeter 1,000. Bacillus coli communis not found.

Two Mile Crib, October 19, 11:00 A. M., 4,400. Bacillus coli communis present.

Three Mile Crib, October 19, 10:30 A. M. 1100 bacteria. Bacillus coli communis not found.

Four Mile Crib, October 26, 11:45 A. M. Bacteria per cubic centimeter 90,000. Bacillus coli communis not found.

68th Street Crib, October 26, 12:30 P. M., 157,500 bacteria. Coli not found.

68th Street Crib November 9, 11:30 A. M., 3,300 bacteria per cubic centimeter. Bacillus coli communis not found.

Four mile crib, November 9, 11:00 A. M., 2900 bacteria per cubic centimeter. Coli not found.

That is the number that we have from Lake Michigan—eleven in all—eleven samples taken.

Q. Was there any examination made of any of these samples for the purpose of classifying the bacterial flora taken therefrom? 148

A. Yes sir.

Q. What was the date of that examination?

A. This sample was collected October 11.

Q. Where?

A. At the two mile crib, and contained the following species of bateria. If you want that?

Q. Have you got the result of that investigation there?

A. Yes sir. Do you want that.

Q. Yes.

A. Organisms bacillus coli communis—bacillus deli catulus; bacillus fluorescens incognitus; bacillus helvolus; bacillus proteus mirabilis; bacillus pyocyaneus; bacillus stellatus; bacillus superficialis; bacillus viridis.

That represents the species found.

Q. Are you familiar with the character of these different bacteria?

A. Yes sir.

Q. Just explain their nature.

A. They are all harmless except the bacillus coli communis—except when injected beneath the skin. It is harmless in the individual except when it gets into the appendix and causes appendicitis.

Q. That causes appendicitis?

A. Yes sir. The mucous membrane of the appendix is very delicate.

149 Q. Are these other bacteria, other than the bacillus coli communis all inhabitants of fresh water?

A. Yes sir.

Q. Both lake and river water?

A. Yes sir.

Q. Their presence does not indicate the absence or presence of sewage?

A. Well, if you use bacillus coli communis—

Q. I say except that?

A. Except that, yes.

Q. Now beginning at that point and passing down the canal or the Chicago River, at what point was the next examination of the water made?

A. At Lockport.

Q. Was that a weekly analysis?

A. Daily analysis.

Q. When did it begin?

A. I can tell you exactly from the records—exactly when we did commence.

Drainage Canal at Bear Trap Dam began March 3 and continued daily until October 9, 1900.

Q. Did it not extend beyond that period also?

A. At this particular time, no—oh, and from September 26 to November 25, 1901.

Q. Now, speaking generally, was there any bacteriological variation or fluctuation in the examinations? 150

A. Oh, yes, a very great fluctuation.

Q. At that point?

A. Yes sir.

Q. What was the character of that fluctuation?

A. Remarkable. It ran from millions of bacteria per cubic centimeter down to a few thousand per cubic centimeter.

Q. Do you know of any reason for that vast fluctuation in that period of time?

A. It will go with the amount of sewage discharged into the water and the pollution in that sewage.

Q. Sewage from where?

A. From Chicago.

Q. Discharged into the canal?

A. Discharged into the canal. It depends upon the quantity of sewage.

Q. What effect did that examination generally speaking, during this first period of time, disclose with reference to the presence or absence of the coli bacillus?

A. It showed it present. It was almost a constant inhabitant of the canal at this point.

Q. Do you know in what percentage they were found?

A. Being found in 87 per cent. of the samples collected.

Q. Have you any record of the percentage of samples in which it was found in the month of March, 1900?

A. Seventy-two per cent.

Q. Have you any record of the percentage for May, June and July?

A. Eighty-seven per cent.

151 Q. Have you any for August, September and October up to the 10th, in this investigation?

A. 100 per cent.

Q. Have you any general record of it from October 5th to the 28th, 1901?

A. Yes. 81.2 per cent.

Q. Did you make any examination—microscopical examinatoin of the waters in the canal at this point?

A. Yes, they were made under my direction. Samples were collected and submitted to Mr. Johnson, and to Mr. George C. Whipple, of New York.

Q. Do you know the number of bacterial flora that the examination at this point disclosed from October, 1900, to September, 1901?

A. Well, we collected—we separated out a number of microorganisms at these different periods. I have them here, a record of them.

Q. Will you please put into the record an explanation of what you mean by bacterial flora?

A. The bacterial flora of the water—inasmuch as bacteria belongs to the vegetable kingdom, we speak of the bacteria found in water as the bacterial flora of that water.

Q. Then it means a class of bacteria?

A. Yes the class of bacteria,—schizomycetes, order thelophyta.

Q. Have you any record of the number of organisms that 152 were isolated from the waters there at the Bear Trap Dam?

A. Yes, four sets of ten organisms each and 80 at another time; so that out of all that we have got quite a number of microorganisms here.

Q. Have you the dates, showing when the sets of samples were collected from the water at that particular point?

A. Yes sir.

Q. What were those dates?

A. September 16, May 31, June 14 and July 9, 1900. Eighty organisms were isolated from the water during the months of October and November, 1901.

Q. Have you any record of the bacterial flora taken at the junction of the canal and the Des Plaines River there at Lockport?

A. Yes sir. That is, I have the names here of those taken out during the second investigation, from March 3, to October 11, 1900.

Q. What year?

A. 1900.

Q. What are they, what were the different—

A. Do you want all these different names of these different bacteria?

MR. HAMLIN: Where is the place?

A. Drainage Canal above the Bear Trap Dam.

Q. MR. CROW: Have you got any record of the analyses 153 of the water at the Bear Trap Dam before it passes over that dam,—testing it for bacillus coli communis during March, April, May, June, July and August,—September and October, 1900?

A. Yes, I have the record together with the number of bacteria found per cubic centimeter.

Q. Well, will you just give me that?

A. You don't want these beautiful names then, associated with those species?

Q. No sir. Now let the stenographers understand that this is a test for bacilli coli communis.

A. Don't you want the number of bacteria also?

Q. Yes, I want that also before the water goes over the Bear Trap Dam.

MR. DRENNAN: And the time and place.

MR. CROW: The Bear Trap Dam. Prior to passing over that dam?

A. Yes, before it passes over the Bear Trap Dam.

MR. DRENNAN: I want the particular dates.

A. This is water taken from the Chicago Drainage Canal before the water passed over the Bear Trap Dam at Lockport, Illinois. March 3rd, number of bacteria 541,000, bacillus coli communis not present.

March 4, 304,000, not present,
March 5 1,014,000, coli communis present,
March 6, 1,602,100, coli communis present,
March 7, 873,900, coli communis absent,
March 8, 408,600, bacillus coli communis found,
154 March 9, 552,400, bacillus coli communis present,
Samples for the 10th and 11th were lost,
March 12, 1,614,000, coli communis present,
March 13, 1,836,000, coli communis present,
March 14, 4,082,000, coli communis present,
March 15, 5,644,000, coli communis present,
March 16, 3,182,000, coli communis—not made—sample lost,
March 17, 12,130,000, coli communis present,
March 18, 11,200,000, coli present,
March 19, 34,300,000, coli communis not found,
March 20, 27,800,000, coli communis not found,
March 21, 21,450,000, coli communis found,
March 22, 22,600,000, coli communis found,
March 23, 15,000,000, coli communis not found,
March 24, 12,450,000, coli communis found,
March 25, 10,880,000, coli communis found,
March 26, 3,450,000, coli communis not found,

March 27, 3,480,000, coli communis found,
March 28, 6,250,000, coli communis not found,
March 29, 275,000, coli communis found,
March 30, 8,100,000, coli communis found,
March 31, 2,633,000, coli communis found,
Now April, same place; same year, same time.
April 1, 11,092,000, coli communis found,
April 2, 2,715,000, coli communis not found,
155 April 3, 3,410,000, coli communis found,
April 4, 4,425,000, coli communis present,
April 5, 1,900,000, coli communis present,
April 6, 3,075,000,—coli communis present,
April 7, 670,000, coli communis found,
April 8, 2,350,000, coli communis present,
April 9, 1,600,000, coli communis present,
April 10, 1,675,000, coli communis present,
April 11, 1,225,000, coli communis present,
April 12, 1,950,000, coli communis absent,
April 13, 5,390,000, coli communis present,

April 14, 1,080,000, sample lost. That is, the bottle was probably broken before a record was made. The record is not made. A bottle sometimes is broken after the counters get through with it, or a particular plate is dropped and spoiled, with which this work has been done, so wherever a zero is marked here, it means that the sample was lost.

Q. MR. JEFFRIES: And the coli communis not examined?

A. It was not examined for coli.

April 15, 4,425,000,—coli communis present,
April 16, 990,000, coli communis present,
April 17, 340,000,—coli communis present,
April 18, 230,000,—coli communis present,
April 19, 90,000, coli communis absent,
April 20, 155,000,—coli communis present,
April 21, 2,843,000,—coli communis present,
156 April 22, 440,000, coli communis present,
April 23, 247,000,—coli communis absent,
April 24, 245,000, coli communis present,
April 25, 105,000, coli communis absent,

April 26, 325,000—coli communis absent,
April 27, 97,000,—coli communis absent,
Sample of April 28th lost.
April 29, 185,000,—coli communis present,
April 30, Sample lost.

RECESS until 2:00 P. M. same day, Wednesday, February 18, 1903.

157 2:00 P. M., Wednesday, February 18, 1903.
Continuation pursuant to adjournment.

Present, Commissioner and same counsel as before.

DR. AMAND M. RAVOLD,

DIRECT-EXAMINATION CONTINUED,

By Mr. Jeffries.

Q. Now doctor, just before adjournment—

A. In May.

Q. Yes, go ahead with your statement.

MR. HAMLIN: We are at the Bear Trap.

A. We are at the Bear Trap dam. On May 1st, 1900—

Q. MR. JEFFRIES: Now you are showing there the results of the determination of bacilli in the canal?

A. Yes sir, discharged by the Chicago Drainage Canal before it passes over the Bear Trap Dam at Lockport, Illinois.

Q. Now go ahead with May 1st.

A. May 1st, 24,500—No determination made of coli.
May 2, 612,,500,—coli present,
May 3, 350,000,—coli present,
May 4, 18,800,—coli present,
May 5, 900,000,—coli present,
May 6, 1,294,000,—coli present,
May 7, 2,524,000,—coli present,
May 8, 114,500,—coli present,
May 9, 149,500,—coli present,
May 10, 188,000,—coli present,
May 11, 663,000,—coli present,
158 May 12, 795,000,—coli not found,
May 13, 255,000,—coli present,

May 14, 128,000,—coli present,
May 15, 78,000,—coli not found,
May 16, 376,500,—coli present,
May 17, 96,000,—coli present,
May 18, 85,000, coli present,
May 19, 28,000,—coli absent,
May 20, 40,000,—coli present,
May 21, 273,000,—coli present,
May 22, 2,725,000,—coli present,
May 23, 1,395,000, coli present,
May 24, 394,500,—coli present,
May 25, 1,311,000,—coli present,
May 26, no samples taken,
May 27, 832,000 coli present,
May 28, 736,000, coli present,
May 29, 15,000, coli present,
May 30, 2,510,000, coli absent,
May 31, no record.

Same place:

June 1, 485,000, bacillus coli present,
June 2, 232,000,—coli present,
June 3, 149,000, coli present,
June 4, 415,000, coli present,
June 5, 296,000, coli present,
June 6, 95,000, coli present,
June 7, 196,000, coli present,
159 June 8, 133,000,—coli present,
June 9, 1,770,000, coli present,
June 10, 1,565,000,—coli present,
June 11, 2,520,000,—coli present,
June 12, 808,000, coli present,
June 13, 281,000,—coli present,
June 14, 376,000,—coli present,
June 15, 2,200,000,—coli present,
June 16, 4,050,000,—coli present,
June 17, 4,860,000,—coli not found,
June 18, 380,000, coli not found,
June 19, 66,000,—determination not made.

June 20, 22,000,—coli present,
June 21, 3,700,000, coli present,
June 22, 1,412,000,—coli present,
June 23, 1,480,000,—coli absent—not found,
June 24, 3,250,000,coli present,
June 25, 5,480,000, coli present,
June 26, 365,000,—coli present,
June 27, 665,000,—coli present,
June 28, 92,000,—coli present,
June 29, 4,500,—coli present,
June 30, not made.
July 1, 214,000,—coli present,
July 2, 1,095,000,—coli present,
July 3, 370,000,—coli present,
160 July 4, 60,000,—coli found,
July 5, 4,640,000,—coli found,
July 6, 450,000, coli present,
July 7, 662,000, coli present,
July 8, 240,000,—coli present,
July 9, 2,150,000,—coli present,
July 10, 133,000,—coli present,
July 11, 109,000,—coli present,
July 12, 94,000,—coli absent,
July 13, 94,000,—coli present,
July 14, 302,000,—coli present,
July 15, 148,500,—coli present,
July 16, 388,000,—coli absent,
July 17, 82,000,—coli present,
July 18, 495,000,—coli present,
July 19, 444,000,—coli present,
July 20, 84,000, coli present,

October 7, 166,000,—coli present,
October 8, 156,000,—coli present,
October 9, 58,000,—coli present.

That is the end of that. That is the baccillus for that
164 particular period above the Bear Trap Dam.

JUDGE SPRINGER: What was the 30th?

A. It only went to the 9th; that runs from the 3rd of March up to the 9th of October.

Q. MR. JEFFRIES: In your statement, doctor,—I noticed you stated sometimes—that you called the bacilli absent; at other times you would say "not found"—what do you mean by those two terms?

A. It means the same thing; it means this: that in examining a quantity of water, that we did not detect the presence of the baccillus. If it was there we failed to fish it out.

Q. Does that necessarily mean that it was not there?

A. No, it doesn't mean that at all. It means that they were unable to find it. When that was absent, or not found, it means the same thing,—but we were unable to find it in the sample.

Q. State whether or not any examination was made, of a biological character of the water in the Des Plaines River at Joliet?

A. Yes sir.

Q. If so, state fully and clearly what that examination was.

MR. DRENNAN: This question applies to 1900?

MR JEFFRIES: Yes sir.

A. An examination was made for the same period of time,—from the 3rd of March through.

Q. At the dam?

A. No, I will give you the place that was made at Des Plaines River at McDonnough Street Bridge Joliet, Illinois. 165

MR SPRINGER: Is that in the body of the city?

A. Yes.

MR. SPRINGER: Does the sewage of Joliet enter the stream at that place?

A. No, sir, not all of the sewage,—but sewage comes in further down,—some of the sewage from the penitentiary and from the iron works above does come in.

Now this is in the second period,—now there is a third period beyond this.

Q. MR. JEFFRIES: The second period was in 1900?

A. 1900, yes, and they were collected from the McDonnough Street bridge, and the record is made here, together with the coli communis. Do you want this record to go in just the same as the other?

Q. Just the same as the other exactly.

Q. GEN. HAMLIN: Now the dates are from what to what?

A. From March 3rd until October,—that would be the 24th, the samples were taken; that was the last sample taken from the 3rd of March to the 24th of October.

JUDGE SPRINGER: What year,—1900?

A. 1900. Now, do you want percentages, the same as we gave before,—the percentage of coli baccilli, for instance, found—

Q. MR. JEFFRIES: Just as you have it in your table.

A. Before I began reading numbers, I stated the percent-
166 age of times that the coli baccilli was found in the particular samples of water collected for a definite month.

The coli baccilli was found in 73 per cent. of the samples collected daily at McDonnough Street Bridge in the five months, March to July inclusive. This organism was found 64 per cent of the time--

Q. That means of the time—of the number of the examinations made?

A. Yes, 64 per cent of the examinations made. In August 78 per cent; in the period September 1st to October 9th inclusive it was found 99 per cent of the time.

Now then, we have a third period. Do you wish me to read that also?

Q. Yes, you may state that also, and what that period refers to.

A. The third period, or the Ruby Street Bridge, 83.3 per cent of the time, and at Brandon's Bridge—

Q. JUDGE SPRINGER: All in Joliet?

A. Yes sir, all in Joliet—at Brandon's bridge, 79.2 per cent of the time. That was in the third period.

Q. MR. JEFFRIES: Now that was the third period?

A. The third period extended to some time in October,—I can not get that exactly.

Q. 1901?

A. Yes,—October and November, 1901. Now then, the
167 results, March 3, at Des Plaines River,—McDonnough
Street, Joliet, 494,200,—coli communis present.

March 4, 714,100, coli absent,

October 8, 133,000,—coli present,
October 9, 34,000,—coli present.

There was a determination made on the 17th,—16,000, coli present, and on the 24th of October, 146,000,—coli present.

Q. MR. JEFFRIES: Now at this time, doctor, did you make any examination as to the bacteria flora?

A. Yes sir.

Q. Did you examine the water taken from the Des Plaines 176 River at that time?

A. Yes,—seventeen distinct species were isolated.

Q. Will you name them?

A. Yes, I can name them. Do you want them?

Q. Yes sir.

A. The bacterial flora of the Des Plaines River at Joliet at McDonnough Street Bridge,—baccillus albus, baccillus aquatilis, sulcatus No. 1; baccillus aquatilis sulcatus No. 5; baccillus cloacae; baccillus coli commus, baccillus delicatulus baccilli fluoresens tenuis, baccillus helvolus; baccillus iridescens; baccillus lacti viscosus; baccillus liquefaciens, baccillus ocracous; baccillus proteus mirabilis; baccillus proteus zenkeri; baccillus stellatus; baccillus superficialis, sarcina lutea.

Q. MR. CROW: Are you through with that table, doctor?

A. Yes sir.

Q. Now this last table that you gave us is the different classes of bacteria that were found in the water at Joliet?

A. Yes sir, 1900.

Q. Did you fix any particular date?

A. No, it is during that investigation of 1900.

Q. Now what is the next point on the river—

A. That we collected material?

Q. Yes.

A. At Peoria, Illinois; that is during this second period of investigation you mean?

Q. Yes, during the second period of investigation.

177 A. That is above Peoria.

Q. How far is that from Joliet?

A. 120 miles I believe, by river.

Q. By river?

A. Yes sir.

Q. Well, have you got the dates and the results of that investigation?

A. Yes sir. Result of the determination of bacteria in the Illinois River three miles above Peoria, Illinois.

MR. CROW: First I want to get the formation of the Illinois River; what is it that forms the Illinois River?

A. The Illinois River is formed by the joining of the Des Plaines and the Kankakee Rivers at a point 23 miles below Joliet.

Q. At what point? At a point 23 miles below Joliet.

Q. Below Joliet?

A. Yes sir.

Q. Now are there any other streams besides the Kankakee that come in there below?

A. Yes sir, at LaSalle, Illinois, about 102 miles below Chicago, the Vermillion river comes in and the Illinois and Michigan canal.

Q. That also enters the Illinois river at that point,—at
178 LaSalle?

A. Yes, at that point, yes. Then there are small rivers and creeks come in between LaSalle and Peoria. There are no large streams entering the Illinois.

Q. Now what is the general characteristic of the water at LaSalle with reference to the number of bacteria in it, compared with the water at Lockport?

A. Well, we went below; we went to Peoria.

Q. I am asking you about that proposition now—

A. Well, we had that in the third period.

Q. I am asking you not for the details of it, but for the general condition of the water

A. Do you mean bacteriologically?

Q. Yes.

A. I can't say because I made no examination at that particular period.

Q. Did you observe the speed of the canal?

A. The speed of the river?

Q. The speed of the canal?

A. The speed of the canal—yes I examined that quite a number of times.

Q. Well at the time of these examinations,—at the time these examinations were begun, the 23rd of January, did you pay any attention to the speed of the water?

A. I wasn't up there on the 23rd of January, but I was there later and there was a perceptible movement of the water; what the speed was I don't know.

Q. Was it rapid or slow?

A. Slow.

Q. How was the speed of the Des Plaines and Illinois
179 River?

A. Why the Des Plaines River, you mean from Lockport, after the Drainage Canal joins it?

Q. Yes.

A. It runs at a very high rate; that is down a declivity; it runs down a hill there.

Q. Is there any difference between that speed at the time it leaves Lockport and the time it reaches Grafton at the mouth of the Illinois River?

A. Oh yes, very great.

Q. Where is the slackening in speed?

A. After it joins the Kankakee River.

Q. At LaSalle?

A. No, some twenty-three miles below Joliet.

Q. That is below LaSalle?

A. No, that is above LaSalle.

Q. Now between LaSalle and Peoria, are there any large streams that come in?

A. The Vermillion River.

Q. Is that a large stream?

A. Yes, a good large stream.

Q. Now, the next collection you made, you say was at Peoria?

A. Yes sir.

Q. Was that made immediately at the town, or above or below?

A. It was made at Averyville, above the town.

180 MR. DRENNAN: Is that above the sewage?

A. Yes, that is above Peoria,—the sewage there.

Q. MR. CROW: Do you know at what point sewage of Peoria enters the river?

A. Yes, a good distance below.

Q. A good deal below?

A. Yes sir, this is up at the water-works; this is up where Peoria has some water-works.

Q. Does Peoria take her water supply from the Illinois River?

A. Drinking water supply?

Q. Yes.

A. Oh, No sir.

Q. What water works?

A. There is a water works there for some damming purposes, I don't know what they do with the water.

Q. Do you know it is not for drinking purposes?

A. I do know it.

Q. What?

A. Yes sir.

Q. Now do the results as to the number of bacilli found in the water at the examinations at Joliet vary during this period of time?

A. At Joliet?

Q. Yes?

A. Oh yes, it varies very greatly you see.

Q. Did it at Peoria, also?

181 A. Yes sir.

Q. How did the variations compare?

A. They seemed to fluctuate somewhat during the seasons, to very high numbers at the Bear Trap Dam. There seems to be a perceptible rise in the number of micro-organisms at Peoria in this period.

Q. Well now, have you anything,—any data that will give you the number of coli bacillus, or the percentage made in the daily tests,—made at the point three miles above the City of Peoria in the first period?

A. Yes.

Q. About what per cent would that average?

A. Colon bacillus was found in 75 per cent of the daily tests made.

Q. Well now during the second period, running up to October 1901—

A. That was in the second period of the daily tests made of samples of water collected at this point,—the second perio

Q. MR. SPRINGER: At the Peoria Water works, above Averyville?

A. Yes sir.

Q. MR. JEFFRIES: Now do you know at what point—at what particular point in the Illinois River this period of tests was taken with reference to the shore?

A. Out in the stream where the current was running 182 fastest, in the channel.

Q. Now have you got the result of that there—you have kept a table, have you?

A. Yes sir.

Q. Covering what period of time?

A. We have during the second period beginning January 23, 1900, and extending until October 9, 1900.

Q. Well, will you just give us that table?

A. Yes sir.

Q. If you have the data giving the result of those analysis and the dates, showing the number of the bacteria, I suppose it is, taken per cubic centimeter?

A. Yes, per cubic centimeter; that is the determination.

Q. This is for the bacillus coli communis?

A. Yes sir.

Q. The total number and the bacillus, coli communis?

A. Yes sir.

Q. At a point three miles above the city of Joliet?

A. No,—Peoria.

MR. DRENNAN: Opposite the water works?

A. Well, I can't say it is opposite the water works.

Q. MR. JEFFRIES: But near to the water works and in the channel of the stream?

A. Yes, we had one of the water works men go out with us in a boat, you know, above the bridge up there.

October 10, sample lost.

Q. Now what is the next point at which you made an examination of the water for the purpose of determining the number of bacteria, and the presence or absence of the coli communis?

A. Grafton.

Q. Have you got a statement of that?

A. Yes sir. Grafton examination, about 163 miles below Peoria, Illinois—

Q. What period of time does that cover?

194 A. That covers the period of time extending from January 23 to October 9.

MR. DRENNAN: 1900?

A. 1900, yes sir.

MR. DRENNAN: Was that above or below where the sewage of Grafton goes in?

A. It was taken at a point two miles above Grafton.

Q. MR. CROW: A point above where the sewage from the city of Grafton empties into the Illinois river?

A. Yes, it empties some sewage, but we took it up above there.

Q. What is the size of Grafton, do you know?

A. I don't know.

Q. Is it a small place?

A. 1,800 or two thousand.

Q. Now you have the data, giving the result of the analyses at this point, three miles, you say above Grafton?

A. Yes, sir, two miles I said.

Q. In the channel of the stream?

A. Yes, we always went out in the river in a boat.

Q. In the channel of the stream, of the Illinois river, between January 23 and October 9, 1900?

A. Yes, sir.

Q. Will you please give them to me for the purpose of determining the number of bacteria in the water analyzed and also the presence or absence of this coli communis?

195 A. Do you want the entire facts—the records that come in there?

Q. Yes sir.

A. The streams that run into the Illinois river between Peoria and Grafton is the Mackinaw, entering the river about sixteen miles below Peoria, the Spoon river, entering about forty-five miles below Peoria, and the Sangamon river, entering about 66 miles below Peoria, Crooked Creek, entering 79 miles below Peoria. I wish to amend that record. It says three miles on this chart. My collectors were instructed to go well above any influence coming from Grafton sewage. They have reported this as three miles above Grafton, where they took the sample.

Q. Well, give us that statement now that I called for in the last question I asked.

A. Yes. We begun taking samples on January 23, 1900, for the quantitive determination of bacteria in the Illinois river three miles above Grafton, Illinois, together with the results of tests for the bacillus coli communis. We finished October 9.

That is all.

MR. JEFFRIES: Now, doctor, in making these examinations when this water was taken from the Illinois river above Grafton, which you have just explained, state whether or not you examined with reference to the bacterial flora of the water?

A. Yes, sir, I did.

Q. Can you give that?

A. The results of the number of the species found there?

Q. That is right, doctor.

207 Bacterial flora of the Illinois river just above Grafton, Illinois—Species:

Bacillus aquatalis sulcatus V,
" aurescens,
" aureus,
" cereus,
" cloacae,
" coli communis,
" delicatulus,
" desiziosus,
" fleuorescens tenuis,
" lacti viscocus,
" liquifacians,
" magaterium,
" mesentericus vulgatus,
" ocraceus,
" plicatus,

Bacillus protens mirabilis,
" proteus zacarei,
" stellatus,
" subflavius,
" ubiquitus,
" ureae,
" veredis,

That is all, Mr. Jeffries,

208 Q. Now, following this second period of the examinations, doctor, in the Mississippi river, what examination was made of that water. Give the time and place.

A. These samples were taken for the quantitive determination of bacteria and for the detection of bacillus coli communis from January 23, until October 29.

Q. What year?

A. 1900.

Q. Where were those samples taken from?

A. Three miles above Grafton.

Q. Now, you have the result of that examination, have you?

A. Yes.

Q. Now, you may give that.

A. Mississippi river now, above Grafton. We just gave you the Illinois three miles above Grafton. This is before it mixes with the Illinois. This is above where any of the bayous flow in; it is way above it.

October 29, 4,400, coli present,

ADJOURNED until 10:00 o'clock A. M., Thursday, February 19, 1903.

Met pursuant to adjournment at the Southern Hotel, at
220 ten o'clock, A. M., February 19, 1903.

Present: The Commissioner, and the same counsel, representing the respective parties.

DR. AMAND NICHOLAS RAVOLD,

resumed the stand for further direct examination by Assistant Attorney-General Jeffries.

Q. A similar examination was made of the water of the Mississippi river a mile above Alton, was there not?

A. Now with that we have the coli, you know, and this special work. The bacteriological character of the Mississippi river water, one mile above Alton. Do you want me to read that?

Q. I want to know when that was made.

A. That was made from January 24 to October 30, 1900. There was a sample taken on October 30.

JUDGE SPRINGER: How far above Alton was this?

A. One mile above Alton.

MR. JEFFRIES: Now, you may give the result of that examination.

A. The results of the examination—do you want me to read them out?

Q. Yes.

A. I think I told you yesterday about the 29 of October, 221 three miles above Grafton on the Mississippi.

MR. DRENNAN: The Doctor, as I recollect it, drew out some paper and started to give the flora and other stuff, yesterday, when we quit, and that was not yet given. This paper he had before him when we adjourned.

A. There was this. I had that bacterial flora—

Q. I know there was something before you that was not read at the time we quit. That is it.

MR. JEFFRIES: Before you answer the last question, doctor, you may go back to the bacterial flora of the Mississippi river just above Grafton with the result of the examination that you gave yesterday afternoon at the close of the testimony.

A. The bacterial flora of the Mississippi river water just above Grafton, Illinois:

Bacillus arborescens,
" aquatilis sulcatus I,
" aquatilis " III,
" " " V;

Bacillus aureus,
" aurescens,
" cereus,
" cloacae,
" coli communis,
222 " fluorescens liquefaciens,
" " termo,
" helvolus,
" lacti viscosus,
" liquefaciens,
" ocraceus,
" proteuszenkeri,
" viridis,

Q. Now you say an examination was made of the water of the Mississippi river about a mile above Alton?

A. Yes sir.

Q. Do you know how far Alton is from the mouth of the Illinois river?

A. On the Mississippi river from the mouth?

Q. Yes.

A. It is about 18 miles. This sample was collected 17 miles below the mouth of the Illinois river, in the channel of the Mississippi river, one mile above Alton.

Q. In general terms, what was the result of that examination?

A. The coli bacillus was found in 52 per cent of the daily tests made for it in this period.

Q. With reference to the number of bacteria?

A. The bacteria. We began taking samples January 24, 1900, and collected the last sample on the 30 of October, 1900.
I found it in 52 per cent. of the daily tests made at this
223 point in that period.

Q. The coli?

A. The coli, yes sir. Do you want the results?

Q. Yes, now I want the results.

A. This table is to be submitted, is it?

Q. No, it is to be read.

A. Do you want me to read it now?

Q. Yes, so as to get it into the record.

A. It is table No. 9. January 24, 1900.

January 24, 1900, 96,400. Is that what you have got on yours?

MR. JEFFRIES: Yes.

A. Coli present.

Q. Go ahead.

A. January 25, 190,600, coli present,
January 26, 119,400, coli absent,
January 27, 119,800, coli absent,
January 28, 119,400, coli absent,
January 29, 111,000, tests not made,

October 22, 1,300, coli present,
" 30, 760, coli present,

Q. Now, you say the other dates in the month of October of that year there were no samples taken?

A. There were no samples taken.

Q. They were omitted?

A. Yes, sir.

MR. SPRINGER: That concludes that table, does it?

A. That concludes that table. Now you want the bacterial flora?

235 MR. JEFFRIES: Now, you made an examination of the bacterial flora in the Mississippi river at that same point just above Alton?

A. Yes, sir.

Q. Have you that?

A. Yes.

Q. Give it to us, please?

A. The bacterial flora of the Mississippi river just above Alton, Illinois, for the 1900 period. Species:

Bacillus aquatilis sulcatus III.
" " " V.
" aureus,
" cereus,
" cloacae,
" delicatelus,
" fluorescens liquefaciens,
" " termis,
" fulves,
" helvolus,
" liquefaciens,
" megaterium,
" proteus zenkeri,
" stellatus,

Q. Where is Hartford, Illinois?

236 A. It is seven miles below Alton, and one mile above the Missouri river, where it empties into the Mississippi.

Q. That is where the Missouri river empties into the Mississippi?

A. Yes, sir.

Q. Did you make any examination of the water of the Mississippi at or near Hartford?

A. Yes, sir.

Q. Hartford is in Illinois?

A. Yes, sir; Hartford is in Illinois.

Q. Now, at what point was the examination made?

A. At this point a boat was sent out into the middle of the stream, out into the channel, and the sample collected. Those samples were collected from January 24, 1900, to October 31, 1900.

Q. Now, can you state the per cent. of the colon bacillus?

A. Yes, sir. The colon bacillus was found in 61 per cent. of the daily samples collected at this point.

Q. What relation did that bear to the percentage of the samples of this organism found at Alton?

A. A slight increase over the average in which this organism was found at Alton. We found it in 52 per cent. in Alton and 61 per cent. here.

Q. Did you preserve the result of your examination of the water collected at this point?

237 A. Yes, and I have here recorded the results of the quantitive determination of bacteria in the Mississippi river opposite Hartford, Illinois, together with results of tests for the bacillus coli communis.

Q. Now, you may give that.

A. The bacteria per cubic centimeter. To begin:

That ends that table.

Q. Have you examined the bacterial flora of the river at that place?

A. Yes sir. The bacterial flora of the Mississippi, opposite Hartford, Illinois, 1900:

Bacillus albus,
" acquatilis sulcatus III,
" arborescens,
" aureus,
" aurescens,
" baunneus,
" cereus,
" cloacae,
249 " delicatulus,
" fluorescens incognitus,
" " liquefaciens,
" " tenuis,
" " termo,
" helvolus,
" iridenscens,
" lactis erythrogenes,

Bacillus mugaterium,
" mesentericus vulgatus,
" proteus mirabilis,
" proteus zenkeri,
" stellatus
" superficialis.

Q. Now during this period of 1900, did you make an examination of the water of the Missouri river opposite Bellfontaine?

A. Yes sir.

Q. When was that made?

A. That was made from October 24 to January 25, 1900.

JUDGE SPRINGER: Was that in Missouri or Illinois?

A. In Missouri. Bellfontaine is situated on the Missouri river, six miles above the mouth, on the Missouri shore, the south shore.

250 MR. JEFFRIES: Now let us have the result.

A. Do you want the percentage of coli?

Q. Yes.

A. The colon bacillus was found in 58 per cent. of the daily samples collected at this point at this period.

Q. Now you have the bacterial flora in the Missouri river, have you?

261 A. Yes, sir, the bacterial flora of the Missouri river opposite Bellfontaine, Missouri, specimens taken from the channel.

Q. Covering the same period?

A. Covering the same period, whatever those dates are, from January 24, to October 25, 1900.

Q. Give them, please.

A. They are as follows:

Bacillus albus,
" antenniformis,
" aquatilis sulcatus III,
" arborescens,
" aurescens,
" cereus,
" cloacae,
" fluorexcens incognitus,
" fulvus,
" liquefaciens,
" megaterium,
" nubillis,
" proteus zenkeri,
" stellatus,
" viridis,
" sarcinalutea.

Q. Now, doctor, during a certain period we have been
speaking about, to-wit, 1900, was an examination made
262 of the character of the Mississippi water at or near the
chain of rocks?

A. Yes sir, three separate examinations were made, what is known as the Missouri shore sample, the intake and the Illinois shore.

Q. You have the result of those examinations?

A. Yes sir.

Q. Separately?

A. Yes sir.

JUDGE SPRINGER: I wish you would state how far each one of these is from the St. Louis intake?

A. The idea was to take a sample not too near the shore, and yet not in front of the intake in the Missouri shore sample. I think the sample was taken about 300 years from the shore in the channel on the Missouri side of the stream.

Q. On the Missouri side of the intake?

A. On the Missouri side of the intake, yes sir.

MR. JEFFRIES: Now with reference to the Illinois shore, where was the sample taken?

A. Do you mean the Missouri sample? If this be the river (indicating), you cross the river like this, and the intake tower is out here toward the center; the Missouri sample is taken 300 yards from the shore where the stream was running rapidly.

Q. 300 yeards from the west shore of the river?

263 From the west shore of the river. The other sample was taken from a boat out in front of the intake, just above it. Not always in the same place exactly. Two or three hundred feet above the intake so as not to get tangled up with it. The third sample was taken in a line with it over toward the Illinois shore. It was enough away to be in the stream several hundred yards away from the shore. Several samples are taken, of course. It is a cross section of the stream.

JUDGE SPRINGER: Which is the first?

A. The Missouri shore together with the results: Colon bacillus was found in 58 per cent. of the daily samples collected at this point.

MR. JEFFRIES: That is, near the Missouri shore?

A. In the Missouri shore sample. The samples were collected from January 25, 1900, to October 30, 1900:

January 25, 262,100, coli absent.

MR. JEFFRIES: Now this is the result of the quantitative examination of bacteria?

A. This is the result of the quantitative determination of the bacteria in the Mississippi river water between the chain of rocks intake and the Missouri shore, together with results for the tests of the bacillus coli communis. Bacteria per cubic centimeter.

Q. This examination also applies to what you said a moment ago. It was made next to the Missouri shore but near the intake?

264 A. Between the intake and the shore, about 300 feet from the shore.

January 25, 262,100, coli absent,

Tests for the coli on the 24th and 25th were negative.

MR. JEFFRIES: That is, absent?

A. Yes sir, absent. The last quantitative estimation of the number of bacteria was February 23, when the coli was present; on the 24th and the 25th the samples were lost in the bacteriological laboratory some way. They were tested for the colon bacillus and it was not found present on the 24th and 25th.

Q. Now, then, give us March.

A. It is as follows:

March 1, 50,500, coli present,
" 2, 93,900, do.
" 3, 27,500, coli absent,
" 4, 40,100, coli present,

Adjourned until two o'clock P. M., February 19, 1903.

2:00 P. M., Thursday, February 19, 1903.

276 Continuation after recess.

Present, Commissioner and same counsel.

DR. AMAND N. RAVOLD,

DIRECT-EXAMINATION, (Cont'd),

By Mr. Jeffries.

Q. Doctor, you have just given the result of the examination of the character of the Missouri River water on the Missouri side of the in-take—

A. Mississippi River water.

Q. Mississippi River water, yes.

MR. HAMLIN: On the Missouri side.

A. On the Missouri side.

Q. MR. JEFFRIES: Now you also stated that you examined the water during this same period near the mouth of the in-take and on the Illinois side?

A. Yes sir.

That is the end of that.

MR. JEFFRIES: At what distance was the other examination made of this series of three examinations from the intake?

A. From the intake?

Q. Yes.

A. Well, as I said, the Missouri sample was taken about 300 yards from the Missouri shore in a line about 100 yards or, well say 100 yards above the intake. The idea was to have a line run straight across the rvier just in front of the intake so that the men in the boat went out and collected the samples at practically the same place every morning.

Q. Then it would be about 100 yards up the river from the mouth of the intake.

A. About 100 yards up the river. Yes.

Q. Now what was the relative per centum of coli bacillus in this examination at the mouth of the river?

A. I gave you that just a moment ago. The colon bacilli
290 was found in 68 per cent. of the samples collected daily at this point.

MR. DRENNAN: That is, it was found in 68 per cent of the samples?

A. Yes.

MR. DRENNAN: That is, it is not 68 per cent of the samples themselves?

A. No.

MR. JEFFRIES: That is, it was found in 68 out of 100 samples taken

A. Yes sir.

Q. Now that is at the mouth of the intake, immediately above the intake?

A. No sir, that was on the Illinois shore.

Q. I am speaking with reference to the per cent at the mouth of the intake

A. Now we are going back. The bacteriological character of the Mississippi river at the intake of the St. Louis water works, chain of rocks—

Q. That is it. What was the per centage?

A. Colon bacillus was found in 62 per cent. of the daily samples taken at this point.

Q. This examination was made at the same time?

A. This examination was made for the results of quanti-
291 tive determination of bacteria in the Mississippi river
water at the intake of the St. Louis water works, at the Chain of Rocks together with results of tests, for bacillus coli communis.—bacteria per cubic centimeter. We began on the 23rd of January, 1900, and ended October 31, 1900.

Q. Now you can give us the result of this third table of examinations.

A. Beginning January 23.

January 23, 16,000, coli absent,

That ends that. Do you want the bacteriological flora at the Mississippi river intake tower?

Q. Yes.

A.

(The bacteriological flora of the Illinois shore sample to be inserted here.) Not furnished, F. S. B., Com'r.

THE WITNESS: The bacteriological flora of the Mississippi river at the intake tower:

Bacillus antitenniformis
" aquatilis sulcatus V
" aurescens
" cereus
" cloacae
" delicatulus
" fluorescens liquifaciens
" helvolus
" iridescens
" lacti viscosus
" liquidus
" megaterium
" stellatus
" subtilis
" ubiquitus
" viridis

MR. JEFFRIES: During this second period, what examination was made of the water from the reservoir?

A. Samples of water were collected for analysis from basin No. 3, the water having rested 70 hours.

Q. What is the capacity of basin No. 3, if you know?

A. It has a holding capacity of 29,000,000 gallons.

MR. SPRINGER: Have you the data for that?

A. Yes. Quantative determination of sample from the reservoir, Chain of Rocks, varies somewhat. Each reservoir has a capacity of 29,000,000 gallons. There are six of these basins.

The samples of water collected for this analysis were taken
304 from basin No. 3, the water having a subsidence of about
70 hours. Do you care to know what the per centage of
figures are in that sedimentation?

Q. Yes, you might just as well give that here, Doctor.

A. It is interesting to note that the average number of bacteria in samples collected at this period—during the second period of 37 weeks was 56 per cent. of the number found in samples collected at the intake tower. 44 per cent. of the bacteria in the water taken into the reservoir, therefore, were removed by this 70 hours subsidence—by this sedimentation.

We don't care to say anything about the third period at all.

Q. When the water goes into these reservoirs it becomes perfectly still, doesn't it?

A. No, it is not absolute quiescence, but it is the water flowing from one end of the large reservoir to the other.

MR. SPRINGER: Within that time?

A. Yes, 70 hours.

MR. JEFFRIES: The only movement of the water is that caused by the water flowing into and on through the reservoirs?

A. Yes, the quantity flowing in and flowing out, during the time it is in transit, during the time it travels across it would be about 70 hours.

MR. DRENNAN: When you refer to the intake tower, you
305 refer to the samples taken just above the intake tower?

A. Yes, I refer to samples taken just above the intake tower.

Q. But the last one of the series you have just given?

A. Yes sir, it is a sample right in front of the tower. You see it is difficult to get a sample in the tower.

Q. That you have compared with the set that you have just read last?

A. Yes sir. The colon bacillus was found in 65 per cent. of the daily samples collected at this point during this period.

MR. SPRINGER: Inside of the tank in the reservoir?

A. Yes, in this water going through.

Q. After the sedimentation?

A. Yes sir.

MR. JEFFRIES: While it is in a state of sedimentation?

A. Yes, sir, after the 70 hours we found 65 per cent of coli in the daily samples collected at this point during this period.

MR. DRENNAN: 65 per cent. of coli and not 65 per cent. of the samples?

A. No, 65 per cent. of the number of samples collected.

MR. DRENNAN: You found coli in 65 per cent. of the samples collected?

A. Yes sir.

306 MR. SPRINGER: Out of 65 of every 100 samples you found coli?

A. Yes, sir; that is it.

MR. SPRINGER: That is, in the reservoir?

A. Yes, sir; that is the water as it flows out of the reservoir into the conduit.

MR. JEFFRIES: Now, you say you have the quantitive determination in the samples collected from those reservoirs?

A. Yes.

Q. When were those collections and examinations made?

A. If you will just let me get the good one of these tables I will give you the results.

Results of the quantitive determination of bacteria in samples of water collected from the reservoir of the St. Louis water works at the Chain of Rocks, together with the results of tests for bacillus coli communis, from January 23, 1900, to October 10, 1900.

That is all.

MR. JEFFRIES: Now following this line of examination on out into the city supply, doctor, I will ask you to state what other examination or further examination was made during this period of 1900?

A. The water collected from a tap in the old city hall during this second period is here reported.

Q. Now where is the old city hall located?

A. On 11th street, between Market and Chestnut streets.

Q. Now it gets its supply from these reservoirs, does it?

A. Yes sir.

Q. That you have testified about?

318 A. Yes sir. I can read you that, which I have written here, and it is right in line.

Q. If that gives the location, you might read that.

A. The water pumped from the Mississippi river at the Chain of Rocks passes through the settling basins at this point, then after about 70 hours subsidence, it passes through an 11 foot conduit to the high service pumps at Baden, which is situated four and one-half miles from the chain of rocks. From this point the water is pumped into the stand pipe located at Compton

Hill reservoir, and distributed to the western part of the city, while the remainder flows through a nine foot conduit and empties into four reservoirs at Bissell's Point. Each of these reservoirs has a capacity of 15,000,000 gallons, and while the actual periods of subsidence of the water in these reservoirs cannot be accurately determined, it is stated to be three or four days on the average. During the second periods samples were collected from the outlets of these basins.—No samples were collected from these basins rather. There is no record of the samples taken in the basins.

Q. That comes at a later period?

A. Yes, that comes at a later period, we did that in the later period.

From these reservoirs the water passes into the distribut-
319 ing system of the city, so the water is turned in to the
stand-pipes at the foot of Grand avenue, and distributed to the eastern part of the city, in which the old city hall is located. So that is the low service pumps.

Q. Can you state about what the distance would be from the old city hall to the reservoir at Chain of Rocks?

A. From the old city hall, to Chain of Rocks, or Bissell's point?

Q. Well, Bissell's point first. We will follow it around as it goes.

A. I should say it is three miles from the city hall, as the crow flies, to Bissell's point, and from there it is here recorded, the distance, I just gave you, 4½ miles from Baden, and so many miles from Chain of Rocks.

Q. That is off in a northerly direction from the city hall?

A. Yes, northwest. During this period it is interesting to note that the average per centage removal of bacteria during the second period, 22 weeks from May 1 to October 9, 1900, found on comparing the results obtained from samples collected at the intake of the St. Louis water works, Chain of Rocks, and the tap in the bacteriological department of the old city hall, respectively was 90 per cent.

MR. HAMLIN: What was that?

A. 90 per cent, of bacteria removed from the intake be-
320 tween those points.

MR. SPRINGER: That is between the intake and the tap?

A. Yes. The bacillus coli communis was found in 71 per cent. of the samples collected during this period from May 1st to October 31st, 1900. This is what is known as the second period.

Q. Now you have the results of the analyses of the water taken at the tap at the old city hall?

A. Yes sir.

Q. Now will you give that?

A. Yes sir. Results of quantitative determination of bacteria and results of tests for bacillus coli communis from samples taken at the old city hall, 11th and Market streets, beginning May 11,—that is when we moved into this laboratory,—together with the results of tests for bacillus coli communis per cubic centimeter. May 11, 1900,—8,400, coli test not made.

MR. JEFFRIES: Now the bacterial flora of the water that you have just testified about, was also examined was it not?

A. Yes sir.

Q. I would like you to give that if you will.

A. Bacterial flora of water taken from tap of the bacteriological laboratory, old city hall, St. Louis, Missouri, May to October, 1900.

Bacillus arborescens
" candicans
328 " cereus
" cloacae
" coli communis
" delicatulus
" desidiosus
" fluorescens teneus
" fulvus
" helvolus
" lacti viscosus
" liquefaciens
" megagerium
" proteus mirabilis
" proteus zenkeri
" rubefaciens
" stellatus
" viridis
Micrococus cremoides
" flavus liquefaciens
Sarcina lutea.

Q. Doctor, in your evidence heretofore, you have referred to what was known as the third period of examination?

A. Yes sir.

Q. I would like you to explain that and state fully what 329 was done in connection with that period, and also the time, month and years, in which it took place?

A. In July, 1901, a motion was adopted by the Municipal Assembly ordering a third investigation of the city water supply to be made. This period of investigation embraced the work done between August 26, and December 1, 1901.

Q. Now then, as to the plan of examination.

A. The plan of procedure was as follows: Temporary bacteriological laboratories were established and equipped with the necessary apparatus at the following points:

ATTORNEY GENERAL HAMLIN: This is between August 26 and—

A. And December 1.

MR. JEFFRIES: This period embraces work done between those two dates?

A. Yes sir, between those two periods inclusive.

Q. Inclusive?

A. Yes sir.

Q. Now then, give us the plan, doctor?

A. The first laboratory was established at Joliet, Illinois, 306 North Joliet street. It was under the charge of Dr. W. C. G. Kirchner.

A second laboratory was established at Peoria, Illinois, in the Young Men's Christian Association Building. Dr. William H. Rush was in charge of that laboratory.

330 The third laboratory was established at Grafton, Illinois, in the Dempsey House. Mr. Leon G. Tedesche was in charge of that laboratory.

A laboratory was established at 1141 Market street, St. Louis, with five assistant bacteriologists under the charge of the witness.

Samples were collected from the following points:

Desplaines river, above Lockport, from October 5, to November 25, 1901. That sample was collected about two miles up the river, well out of the reach—

Q. Above Lockport?

A. Above its junction with the Chicago drainage canal water, so there would be no back water in it.

Drainage canal, Bear Trap dam, above dam, September 26, to November 25, 1901.

Q. Now where was that collection made?

A. That was in the Chicago drainage canal above the dam.

MR. NICHOLSON: At Lockport?

A. At Lockport ,above the controlling works.

Illinois and Michigan canal, 9th street brdige, Lockport, Illinois, September 25, to October 30, 1901.

Drainage canal, 9th street bridge, Lockport, Illinois.

Now that was called the Desplaines river formerly, but now it is called the drainage canal.

MR. SPRINGER: Above the controlling works?

A. As the water flows through Lockport towards Joliet,
why, Mr. Randolph, in his nomenclature, constantly calls
331 it the drainage canal, and said that the Sanitary District
practically owned it down through Joliet. So when I say
drainage canal, 9th street bridge, Lockport, Illinois, that means
the Desplaines river to which is added the effluence from the
Chicago drainage canal. That is called there the canal.

MR, JEFFRIES: Now state the date of that?

A. October 2 to November 26.

Q. 1900?

A. 1900.

Drainage canal below Rubey street, Joliet, Illinois, September 25 to November 26, 1901.

Drainage canal, Brandon's bridge, Joliet, September 25 to November 26, 1901.

Illinois river, at a point known as Shady Beach, about three miles above Peoria, Illinois, October 1, to November 27, 1901.

Illinois river, above railroad bridge, Pekin, Illinois. October 1, to November 27. This station is five miles below the lowest Peoria sewer.

Illinois river, Kingston, three miles below Pekin, Illinois, October 4 to November 27, 1901.

Illinois river, three miles above Grafton, Illinois, October 4 to November 27, 1901.

Mississippi river, two miles above Grafton, Illinois, Octo-
332 ber 4, to November 30, 1901.

Mississippi river, one mile above Alton, Illinois, October 5, to November 30, 1901.

Mississippi River, opposite Hartford, Illinois, October 5, to November 30, 1901.

Missouri river, opposite Fort Bellefontaine, October 4 to November 30, 1901.

Mississippi river, Chain of Rocks near Illinois shore, September 14 to November 30, 1901.

Mississippi River, Chain of Rocks near the Missouri shore, September 14, to November 30, 1901.

Mississippi river, intake tower, September 14 to November 30, 1901.

Q. Now that is intake tower at the Chain of Rocks?

A. At the Chain of Rocks, yes.

Reservoir at Chain of Rocks, September 15 to November 30.

Reservoir, Bissell's Point, September 16 to November 30.

Tap laboratory 1141 Market st., St. Louis, September 17 to November 30, 1901.

Tap, residence, 5946 Garfield avenue, October 2 to November 30, 1901.

MR NICHOLSON: That is at St. Louis also?

A. St. Louis also.

333 Seven samples were collected at LaSalle, Illinois, from the Illinois, and 24 at Beardstown, Illinois. Both samples were sent to Peoria—

MR NICHOLSON: Packed in ice for analysis.

A. Yes sir, packed in ice for analysis.

Q. That is, all these samples?

A. That is all the samples collected at LaSalle and Beardstown.

MR JEFFRIES: A few moments ago you referred to statements made to you by Mr. Randolph.

A. Engineer Randolph.

Q. And to the fact that he called the Desplaines river part of the canal, or called it canal.

A. Yes sir.

Q. Do you know what position he occupied with reference to the Sanitary district of Chicago?

A. He is chief engineer. He and I together selected these points of collection at Lockport and Joliet, and he of course knows the topography of the country better than I. While driving along the canal he would constantly speak of it as the drainage canal, and I noticed the people afterwards constantly spoke of it as the drainage canal.

MR. DRENNAN: They call it canal as far as they made the improvements.

MR. SPRINGER: They made some improvements?

334 A. That is, down to the bridge. It is commonly spoken of there as the drainage canal.

MR. JEFFRIES: Now, doctor, do you know the number of samples daily that were collected during this period?

A. There were daily samples collected, and I have got a list of the number collected at the different points.

Q. Give those. A number of samples collected daily for the determination of bacteria per cubic centimeter and the presence of bacillus coli communis.

Desplaines river at Lockport, two miles above its junction with the drainage canal water, 40 samples.

Drainage canal, Lockport, above Bear Trap dam, 52 samples.

Q. Now then, how far is that from the place where the samples were collected in the Desplaines river at Lockport?

A. The samples collected in the Desplaines river at Lockport were collected two miles above this point of collection, the controlling works.

Q. Then that is two collections taken out of the Desplaines river two miles above the controlling works?

A. Yes, a man drove up in a buggy, up the river and got a sample. It is quite a distance from Joliet, about 15 miles. A man went there to collect samples daily. Illinois and Michigan canal, Lockport, 9th street bridge, 34 samples.

Q. How far is that from the Bear Trap dam at Lockport?

335 A. Oh, four or five hundred yards, I think.

MR. SPRINGER: They run parallel with one another. They are the same stretch.

A. It is a convenient place to take samples.

MR. JEFFRIES: Bear trap dam is the end of the canal, is it?

A. No, of the Chicago drainage canal, while the Illinois and Michigan canal lies further south. And in passing through Lockport a bridge is thrown over. It is an easy place to collect samples, so we took samples from that bridge over the Illinois and Michigan canal.

MR. DRENNAN: The Illinois and Michigan canal and Chicago drainage canal are entirely separate and distinct?

A. Although both of them hold sewage of Chicago.

Illinois and Michigan canal, 34 samples.

Drainage canal, 9th street bridge, Lockport, 41 samples.

MR. JEFFRIES: Now what is the distance between the point where those samples were taken and the drainage canal 9th street bridge at Lockport and the Desplaines river at Lockport?

A. About 300 yards, I would say. I am simply guessing at it as measured by the eye.

Q. Now do I understand that the Desplaines river, the Chicago river, the Illinois and Michigan canal and the
336 drainage canal all get together about this point.

A. They get together a little bit below, and become very friendly as you will see.

Drainage canal below Rubey street, Joliet, Illinois—

Q. How far is that from the 9th street bridge?

A. I think it is 6 or 7 miles.

Q. How many samples did you collect there?

A. 51.

The only way I can estimate the distance, we seemed to be all day driving there.

Drainage canal, Brandon's bridge, 49 samples.

Brandon's bridge is 5 miles below this Rubey street sample, so that would be about 12 miles from the drainage canal at Lockport.

From the Illinois river, Shady Beach, above P[illegible], 54 samples. That is 120 miles down the river.

ATTORNEY GENERAL HAMLIN: Three miles above Peoria?

A. About three miles above Peoria, Shady Beach, it is called.

Illinois River, above Railroad bridge, Pekin, Illinois, 57 samples.

MR. JEFFRIES: How far above the bridge?

A. Oh, the sample was taken from the bridge.

Q. And that is how far from Peoria?

A. Ten miles from the center of Peoria to the center of Pekin. It is five miles here below the last sewage dis-
337 charge, Peoria sewage, into the Illinois river.

Kingston, three miles below Pekin, 55 samples. ?

Illinois river, three miles above Grafton, Illinois, 56 samples.

Mississippi river, two miles above Grafton, Illinois, 56 samples.

Mississippi river, one mile above Alton, Illinois, 52 samples.

Mississippi river, opposite Hartford, Illinois, 51 samples.

Missouri river, opposite Ft. Bellefontaine, 55 samples.

Mississippi river, Chain of Rocks, Illinois shore, 74 samles.

Mississippi river, Missouri shore, 72 samples.

Mississippi river, intake tower, 70 samples.

Reservoir, outlet screen chamber it is called, Chain of Rocks, 75 samples.

Q. State what you mean by the outlet screen chamber where these are located?

A. That is located in about the middle of the end of the reservoir, facing south, and the water discharges out of this hole in the wall through a screen, and consequently they call it the outlet screen chamber, there is a little building there.

Q. It is out at the end of the reservoir?

338 A. It is out at the end of the reservoir. There is a little building there that is constructed for the purpose of controlling the valve that allows the water to exit or to be shut off.

Q. How far is that from the shore of the river?

A. From the Mississippi river?

Q. Yes.

A. I suppose that is 300 or 400 feet.

Q. Out in the water?

A. No, no, the reservoir is up on the land, high on the bank, but the river is 300 or 400 feet away.

Q. Then this screen chamber is situated near the reservoir?

A. The screen chamber is part of the reservoir. It is the south end of the reservoir, the reservoir and settling basins at Bissell's point.

Q. Now that is the same Bissell's Point that you described in your testimony with reference to period No. 2?

A. Yes sir, it is the same point lower down. Do you want the number of samples taken at Bissel's point?

Q. Yes.

A. 72.

Tap laboratory 1141 Market street, 69 samples.

339 Tap, 5946 Garfield avenue, St. Louis, 49 samples.

Illinois river, LaSalle, 7 samples.

Illinois river, Beardstown, Illinois, 24 samples, making a total of 1215.

Q. Now during this period the work was done under your supervision, was it?

A. Yes sir, entirely.

Q. How soon did you plate the samples that you collected from the canal at Lockport and the river at Peoria?

A. They were taken at once to the laboratory, placed on ice and plated without delay.

Q. Now that is this true of all of these samples?

A. All of these samples that were collected at points where laboratories were established. Now in St. Louis a room was secured from the water commissioner at the Chain of Rocks pumping house, and the samples were collected in the river for the Chicago and St. Louis experts at the same time and place. A Chicago and a St. Louis bacteriologist plated the samples in this same room, so that the samples were plated immediately when brought ashore.

Q. Now what were the facilities furnished by the city at that time?

A. The city furnished a good room and it was kept warm. I believe Chicago paid for some of that heat, anyhow it was a convenient place for the men to do their plating. The 340 plates were then brought to the laboratories of both parties, brought to 1141 Market street by Mr. Damon, who did our plating and to the Chicago laboratory by the Chicago expert located somewhere on Locust street, both going in and out together to the Chain of Rocks.

Q. By whom?

A. I don't know who did the Chicago plating. I met the young man, but I have forgotten his name.

Q. You know that they collected the samples at the same place?

A. I know they were collected, because these men went out together.

Q. How were the samples collected?

A. They were collected with an apparatus designed by myself in wide mouthed steriled flasks, at 3 feet below the surface.

Q. In the same manner that you collected them in the second period?

A. Yes sir.

Q. And with the same apparatus?

A. With the same apparatus, yes sir. The temperature being taken and recorded at the same time of the water and the air, with a thermometer that was part of the apparatus.

Q. What was the total number of samples collected?

A. 2325 were collected at the various points noted above, and analysis for quantative determination of bacteria and tests made for bacillus coli communis.

Q. In addition to that, did you investigate the bacterial
341 flora of the water?

A. Yes sir. Besides that a systematic study of the flora was made by an expert microscopist.

Q. Who was that?

A. Mr. George C. Whipple, of Brooklyn, New York.

Q. How many sets of organisms did you have in the bacterial flora examined?

A. We separated out eight sets of ten organisms each—were separated out in pure culture, 80 organisms at each station.

Q. Now, explain that culture.

A. Why, the sample collected at a definite time each week, once or twice a week, was plated according to the method described in the first period, and then ten colonies were selected from that plate, always trying to select a colony that was new to the bacteriologist. He selected the first ten that were familiar to him and the next time he went over that plate he tried not to select any of that same form, the idea being to try to find all the different species of micro-organisms in that particular water.

Q. Plating for what?

A. For variety of species. Now then, when a colony was seen to be different from the others it was picked out and sown on agar agar. Of this growth on the agar agar a strained
342 preparation slide was made and we studied that microscopic form. If the culture proved to be a pure one, then it was sown in a variety of media to ascertain its cultural characteristics.

Q. That was done to cultivate it.

A. Yes sir, it was cultivated on a variety of media, and the results were recorded on a chart that was original with our laboratory. Of these charts there, 300 of them, some 30 different varieties of media were used.

Q. Now in the examinations made in this third period and the manner in which the culture was conducted, you used the same precaution and exercised the same safeguards that you did in the number of the second division of your investigation, did you not?

A. Yes sir. In fact to a greater skill, more accuracy.

Q. Well, you testified clearly and fully in the second division as to the manner in which these experiments were conducted?

A. Yes sir.

Q. What I want to know is if these experiments in the third period were carried on in the same manner?

A. Yes sir.

Q. And according to the same rules?

A. Yes sir, and according to the same rules and with exquisite care by a bacteriologist at each one of the points.

Q. Now have you the result of those examinations with
343 reference to the tests for bacillus coli communis?

A. Yes, we have got that, bacillus coli communis, and the quantative determination of bacteria at all of these places the Desplaines rives, the Bear-trap dam, Lockport, Drainage canal, Lockport; Illinois and Michigan canal; drainage canal below Rubey street; drainage canal at Brandon's bridge. That is the one you want first.

Q. Yes, we will start at the other end, at the Chicago end of it.

A. Yes, well I have got that, Desplaines river, we went up the river to get beyond the backwater of the Chicago drainage canal at its union with the river. We began taking samples from the Bear-trap dam.

Q. Now then, doctor, give us the result of your examination of the waters at the various places at which samples were taken, as to containing bacteria per cubic centimeter and also as to the evidences of the bacillus coli communis.

Adjourned until ten o'clock a. m. February 20.

344 Met pursuant to adjournment at the Southern Hotel, at ten o'clock, a. m., February 20, 1903.

DR. AMAND NICHOLAS RAVOLD

resumed the stand for further direct examination by Mr. Jeffries.

MR. JEFFRIES: Mr. Reporter, repeat the last question that was asked yesterday.

THE REPORTER: (Reading). Now, then, will you give the result of your examination of the water at the various places where samples were taken, as containing bacteria per cubic centimeter, and also evidence as to the bacilli coli communis.

A. At what points?

Q. That is, at the points where these samples were taken, concerning which you testified yesterday afternoon, at the close of your testimony?

A. Yes sir.

Q. You can state again the different points at which these samples were taken.

A. Yes sir. I had a list that I read from.

Q. It is on pages 11 and 12, doctor.

A. Yes. The Desplaines river two miles above Lockport. Do you want that copied to-day? Do you want the reporter to take this?

345 Have you got it in the record?

November 20, 5,010,000, coli test not made,
“ 21, 1,600,000, do.
“ 22, 4,960,000, do.
“ 23, 7,200,000, do.
“ 24, 5,075,000, do.
“ 25, 2,725,000, do.

That ends that story. Now September 26th, 1901, we begin again in another place. The Illinois and Michigan canal, 9th street bridge, Lockport, Illinois, for the quantitative determination of bacteria per cubic centimeter and the test for the bacillus coli communis. The Illinois and Michigan canal. I took some samples from this canal to see what were the numbers in it also, because the Chicago sewage is being pumped into it from the south fork of the Chicago river. This is not the Chicago Drainage canal.

349 September 26, 205,000, coli absent,
“ 27, 787,000, present,
“ 28, 70,700, absent,
“ 29, 117,000, present,
“ 30, 1,300,000, test not made.

Illinois and Michigan canal for October:

October 1, 300,000, coli absent,
“ 2, 58,000, present,
“ 3, 75,000, present,
“ 4, 50,000, present,
“ 5, 1,600,000, present,
“ 6, 189,000, absent,
“ 7, 420,000, coli test not made,
“ 8, 815,000, do.
“ 9, 435,000, absent,
“ 10, 530,000, present,
“ 11, sample lost,
“ 12, 760,000, present,
“ 13, 690,000, absent,
“ 14, 460,000, absent,
“ 15, 860,000, absent,
“ 16, 3,280,000, coli test not made,
“ 17, 480,000, absent,
“ 18, 1,010,000, present,
“ 19, 780,000, absent,

350 October 20, 390,000, test not made,
“ 21, 440,000, do.
“ 22, 355,000, absent,
“ 23, 310,000, not made,
“ 24, 560,000, present,
“ 25, 890,000, coli test not made,
“ 26, 970,000, do.
“ 27, 690,000, do.
“ 28, 620,000, do.
“ 29, 472,500, do.
“ 30, 2,850,000, do.

That is all for that month. In fact, that is all for the Illinois and Michigan canal. Now the Drainage canal, Rubey street, Joliet, Illinois.

MR. JEFFRIES: That is, just below Rubey street?

A. Yes sir, just below Rubey street. The Desplaines river here is called the drainage canal.

JUDGE SPRINGER: But it is really the Desplaines river?

A. It is really the Desplaines river. Now the quantitative determination of bacteria per cubic centimeter, and the detection of the bacillus coli communis:

September 26, 870,000, present,
“ 27, 71,000, do.
“ 28, test not made; sample lost,
“ 29, 220,500, present,
“ 30, 1,250,000, absent,
351 October 1, 21,000, test not made,
“ 2, 29,000, do.
“ 3, 335,000, do.
“ 4, 48,000, present,
“ 5, 355,000, present,
“ 6, 585,000, test not made,
“ 7, 245,000, present,
“ 8, 50,000, present,
“ 9, 50,000, test not made,
“ 10, 60,500, present,
“ 11, sample lost,
“ 12, 30,000, test not made,

October 13, 54,500, present,
“ 14, 86,000, do.
“ 15, 3,640,000, absent,
“ 16, 112,000, present,
“ 17, 39,000, present,
“ 18, 109,000, “
“ 19, 96,000, “
“ 20, 276,000, “
“ 21, 63,500 “
“ 22, 65,000, test not made,
“ 23, 56,000, present,
“ 24, 131,000, “
“ 25, 120,000, “
352 “ 26, 652,000, test not made,
“ 27, 183,000, absent,
“ 28, 1,110,000, absent,
“ 29, 219,000, test not made,
“ 30, 330,000, do.
“ 31, 346,000, do.

Now for November: The colon tests were not made throughout this month.

November 1, 328,000,
“ 2, 635,000,
“ 3, 213,000,
“ 4, 153,000,
“ 5, 102,000,
“ 6, sample lost,
“ 7, sample lost,
“ 8, 143,000,
“ 9, 400,000,
“ 10, 148,000,
“ 17, 392,000.

None between the 10th and the 17th.

November 18, 1,525,000,
“ 19, 1,700,000,
“ 20, 2,200,000,
“ 21, 3,500,000,
353 “ 22, 3,600,000,
“ 23, 3,180,000,
“ 24, 3,400,000,

November 25, 2,390,000.

That is the end of November. Now the Desplaines river at Brandon's bridge, below Joliet. September 26, bacteria per cubic centimeter, no sample taken.

September 27, 344,000, coli test not made,
“ 28, 418,000, present,
“ 29, 172,000, present,
“ 30, 328,000, coli test not made.

Brandon's bridge at the same place.

October 1, not satisfactory,
“ 2, 39,000, coli test not made,
“ 3, 335,000, present,
“ 4, 34,000, present,
“ 5, 1,850,000, coli test not made,
“ 6, 770,000, do.
“ 7, 900,000, present,
“ 8, 32,000, test not made,
“ 9, 37,500, present,
“ 10, 64,000, test not made,
“ 11, sample lost,
“ 12, 57,000, absent,
354 “ 13, 68,000, present,
“ 14, 64,000, present,
“ 15, sample lost,
“ 16, 110,000, test not made,
“ 17, 66,000, do.
“ 18, 47,500, do.
“ 19, 46,000, present,
“ 20, 29,500, test not made,
“ 21, 79,000, do.
“ 22, 37,500, present,
“ 23, 44,00, absent,
“ 24, 1,950,000, present,
“ 25, 213,000, test not made,
“ 26, 153,000, do.
“ 27, 93,000, do.
“ 28, 555,000, do.
“ 29, 619,000, do.
“ 30, 221,000, do.
“ 31, 280,000, do.

Colon tests not made at all in this next month.
November 1, 498,000, coli test not made,
“ 2, 300,000,
“ 3, 151,000,
“ 4, 190,000,
“ 5, no samples,
355 “ 6, no sample,
“ 7, do.
“ 8, 160,000,
“ 9, 447,500,
“ 10, 150,000,
“ 11—Now until the 17th no samples taken.
November 17, 400,000,
“ 18, 2,070,000,
“ 19, 1,250,000,
“ 20, 2,280,000,
“ 21, 3,270,000,
“ 22, 3,315,000,
“ 23, 2,405,000,
“ 24, 3,150,000,
“ 25, 3,580,000.

That is the last of the drainage canal, Brandon's bridge, below Joliet.

MR. JEFFRIES: Now there are two other places.

A. Yes sir. Now we go to the Desplaines river, beginning October 6.

JUDGE SPRINGER: Where is this, in the Desplaines river?

A. The Desplaines river, two miles above the conjunction, with the effluence of the Chicago Drainage Canal.

October 6, 202,000, coli absent,
“ 7, 2,500, do.
356 “ 8, 3,000, absent,
“ 9, 2,000, absent,
“ 10, 2,200, present,
“ 11, no sample taken,
“ 12, 3,300, present,
“ 13, 4,400, absent,
“ 14, 3,700, test not made,
“ 15, 5,300, absent,

October 16, 25,800, questioned, coli absent,
" 17, 4,200, absent,
" 18, 4,100, present,
" 19, 152,000, absent,
20, 15,200, test not made,
" 21, 1,200, present,
" 22, 1,400 absent,
" 23, 2,300, present,
" 24, 1 900, do.
" 25, 3,200, test not made,
" 26, 1,400, do.
" 27, 1,600, absent,
" 28, 1,800, do.
" 29, 2,400, coli test not made,
" 30, 1,300, do.
" 31, 1,900, do.

That is the last of October.

357 November 1, 1,700, coli test not made,
" 2, sample lost,
" 3, 7,100, coli test not made,
" 4, 3,700, do.
" 5, sample lost,
" 6, sample lost,
" 7, sample lost,
" 8, 1,800, coli test not made,
" 9, 2,800, do.
" 10, 1,200, do.
" 17, 2,400, do.

None between the 10th and 17th.

November 18, 10,100, coli test not made,
" 19, 2,000, do.
" 20, 2,900, do.
" 21, 2,300, do.
" 22, 4,500, do.
" 23, 6,500, do.
" 24, sample lost,
" 25, 1,900, do.

That ends the Desplaines river.

Drainage canal and Desplaines river at 9th street bridge, Lockport. We get a mixture of the two waters here, the drainage canal and the Desplaines river.

The quantitative determination of the bacteria per cubic
358 centimeter and bacillus coli communis.

October 2, 57,000, present,
“ 3, 110,000, test not made,
“ 4, 85,000, absent,
“ 5, 291,000, absent,
“ 6, 930,000, absent,
“ 7, 540,000, test not made,
“ 8, 32,000, absent.
“ 9, 54,000, coli test not made,
“ 10, 58,000, present,
“ 11, sample lost,
“ 12, 53,500, present,
“ 13, 1,610,000, absent,
“ 14, 54,000, absent,
“ 15, 85,000, absent,
“ 16, sample lost,
“ 17, 830,000, coli test not made,
“ 18, sample lost,
“ 19, 84,000, present,
“ 20, 58,000, test not made,
“ 21, 56,000, do.
“ 22, 41,000, present,
“ 23, 50,000, present,
“ 24, 59,000, test not made,
“ 25, 1,000,000, present,
“ 26, sample lost,
359 “ 27, 156,000, present,
“ 28, 554,500, absent,
“ 29, 115,000, absent.
“ 30, 323,000, absent,
“ 31, 339,000, test not made.

That is all for October.

Drainage canal, 9th street bridge, Lockport:

November 1, 215,000, coli test not made in November at this point.

November 2, 902,000,
“ 3, 895,000,

November 4, 270,000,
“ 5, 96,000,
“ 6, test not made,
“ 7, do.
“ 8, 940,000,
“ 9, 690,000,
“ 10, 191,000,
“ 17, sample lost,
“ 18, 5,511,000,
“ 19, 3,320,000,
“ 20, 2,710,000,
“ 21, 1,850,000,
“ 22, 4,470,000,
“ 23, 6,000,000,

That is the end of that examination. It ended on the 23rd
360 of November.

MR. JEFFRIES: Now, Doctor, during this third period, was there any examination made of the character of the Desplaines river at Joliet?

A. Yes, sir.

JUDGE SPRINGER: That is where he has given all of those numbers. He has given those, Rubey street, and Brandon's bridge. That is in Joliet.

MR. JEFFRIES: Oh, yes.

Q. Can you give the percentage of samples in which bacilli coli communis was found in this examination we have just gone over, at these various places?

A. Yes, sir.

Q. Now, please state that.

A. The colon bacillus was found in 73 per cent. of samples collected daily at McDonough street. That was in the second period we have just mentioned. That was given yesterday.

MR. JEFFRIES: The day before yesterday, rather.

A. At Rubey street, in 83 per cent. of the samples. That is, the Desplaines river at Joliet and at Brandon's bridge in 79 per cent. of the samples examined.

MR. JEFFRIES: At Brandon's bridge, how much?

A. 79 per cent. Do you want this average of bacteria found above the Bear Trap dam to go in, so as to compare with the drainage canal at the 9th street bridge?

361 Q. Yes, put that in.

ATTORNEY-GENERAL HAMLIN: How is that?

A. We have here a table showing the daily average bacteria per cubic centimeter, found at Lockport, Illinois, above the Bear Trap dam, drainage canal, above the Bear Trap dam, in the Desplaines river, and the drainage canal at the 9th street bridge, Lockport, for the months of October and November, 1901. We found that the average number of bacteria for the month of October, 1901, in the Desplaines river, two miles above its union with the effluence of the drainage canal, contained 18,004 bacteria, for the month of October; the Desplaines river, November, 1901, 4,235. Drainage canal above the Bear Trap Dam for the month of October, bacteria per cubic centimenter, 440,150, and for the month of November, 2,263,530.

The drainage canal, 9th street bridge, Lockport, for the month of October, bacteria per cubic centimeter, 293,270, and for November, 1,997,180.

MR. JEFFRIES: Now, during this third period, Doctor, what examination was made of the water below Joliet on the Illinois river?

A. The next examination made—the laboratory was established at Peoria, in the Y. M. C. A. building, and a few samples were collected at LaSalle, in the Illinois river, and samples
362 taken daily from the river at Peoria.

Q. And those examinations were made immediately, as you testified?

A. As they came to the laboratory. They were carried to the laboratory immediately and plated. That was samples collected above Peoria, below Peoria, at Pekin, and at Kingston. Further down, the Beardstown samples were collected and sent back to the Peoria laboratory encased in ice.

Q. Now, at any other point below Beardstown?

A. At Grafton also.

Q. And they were plated and sent to St. Louis?

A. No, they were plated, and examined right at the laboratory at Grafton.

Q. Now, during that period and at these respective places can you give the percentage of colon bacillus that was found in the water in the tests?

A. Yes, sir.

Q. Now, what is that?

A. The colon bacillus was found in October, 1901, in 87.1 and in November 79.1 per cent.

Q. Now, at what points?

A. That is above Peoria, at Shady Beach.

Q. How far above Peoria?

A. Three miles.

Q. That is above the entrance of the Peoria sewage into
363 the Illinois river?

A. Yes, sir.

Q. Now, what rivers enter into the Illinois river between Joliet and Peoria, if you know, Doctor?

A. Well, quite a number. Do you mean enter in to make up the Illinois here?

Q. Well, give the distance if you can between Joliet and Peoria on the Illinois river.

A. 120 miles.

Q. Now, then, what rivers enter into the Illinois river in that distance, 120 miles, between Peoria and Joliet?

A. Well, we have the Dupage forming with or joining the Desplaines river to form and join the Kankakee. I mean before the Desplaines river meets the Kankakee, the Dupage river discharges into it.

Q. Into the Kankakee?

A. No, into the Desplaines. And they meet the Kankakee and make the Illinois river, form the Illinois river. The river passes along then, and the Fox comes in from the north, and the Vermillion from the south.

Q. Now, do you know anything of the relative size of those various streams?

A. Yes, I have got Mr. Harmon's figures on it, and Mr. Cooley's figures, showing the size of these streams.

Q. Who is Mr. Cooley?

364 A. Mr. Cooley was, I believe, the first engineer of the Chicago Drainage canal.

Q. Who is Mr. Harmon?

A. Mr. Harmon is a gentleman with a red beard, often seen around here, and is an engineer living at Peoria, Illinois, who made the sanitary survey of the river, giving the volumes, etc.

ATTORNEY-GENERAL HAMLIN: He is with the state board of health now.

A. Is he now?

Q. He has been all the time.

A. That survey was made for the state board of health, then.

MR. JEFFRIES: What was the size of those rivers, from the information you have? In addition to this, you have viewed those rivers personally, have you not?

A. All but the Dupage river. I was never on the Dupage river. I doubt very much one of these figures, those of the Vermillion river, but here it is, flow per cubic feet per second of water. This is taken from the report of Mr. Harmon, made during the low stages in October, 1889, and represents approximately the average condition of these streams during the late summer and early fall months. The Desplaines flows per cubic feet per second (not gallons, but feet) 13.21. The Dupage 32.77, the Kankakee, 509.24, the Fox, 329.95. He has the Vermillion marked here, 4, which is probably wrong, because the Vermillion is a very much larger river than the Desplaines. These 365 are the rivers that come in above Peoria.

Q. You say that estimate was made at the time when the river was low?

A. It states here, made during the low water stages in October, 1899, and these figures are copied by Mr. Cooley in his work on the waterways, lakes and waterways, of which you have a copy.

Q. Now, are they the same as Mr. Harman's?

A. Yes, they are the same. They give four cubic feet per second for the Vermillion, which is small. Besides that, at LaSalle, discharges into the Illinois, the Illinois and Michigan canal, but at this particular time last year, when bacterialogical work was going on, the water was stagnant and very little water flowing out of it.

Q. Out of the canal?

A. Out of the canal, into the river.

Q. That is, into the Desplaines or Illinois?

A. Into the Illinois river at LaSalle. I sent a man up there and he informed me about the place, and I also had a man collecting samples at LaSalle.

Q. Now, I understand you to say you made examinations during the months of October and November, 1901, of the water of the Illinois river, at Peoria, Pekin, Kingston, Beardstown?

A. Yes, sir.

Q. Now, that examination was made with a view to obtaining the number of bacteria per cubic centimeter, and also

366 evidence of coli communis?

A. Yes, sir.

Q. I would like to have you give the result of your examination, Doctor?

A. All right, sir. You already have the places marked for the collection of these samples, at Shady Beach, above Peoria.

Q. Now, before we go into this, Doctor, I would like to have you state where the examinations were conducted from the tests taken at LaSalle?

A. The sample was packed in ice, collected at LaSalle with the apparatus which has been described, by a man employed there, and collected above the point of discharge of the Illinois and Michigan canal into the Illinois river, so as not to have the effluence of the Illinois and Michigan canal mixed with this water.

Q. Where was the examination of the tests made?

A. The sample was collected at LaSalle and shipped at once to Peoria, a few miles below, and examined there as soon as it arrived.

Q. Now, where were the tests made of the water that was taken from the river at Peoria?

A. The water was taken from Peoria at Shady Beach, three miles above Peoria, and immediately carried to the laboratory and placed on ice or examined at once.

Q. The laboratory at Peoria?

A. At Peoria, yes, sir; in the Y. M. C. A. building.

367 Q. Now, with reference to Pekin?

A. The Pekin sample was collected and carried directly to the laboratory at Peoria, and examined there.

Q. Now, then, give the result of the examination of the samples of water taken at LaSalle?

A. Seven samples in all received.

Q. Now, the dates to which you refer are the dates on which the sample was collected?

A. Yes, sir; the date on which the sample was collected is here recorded.

October 28, 1901, bacteria per cubic centimeter, 7,500, coli present.

Q. Just a moment, Doctor. Now was it analyzed the same day?

A. Yes, but it would have made very little difference, though; it was packed in ice. The numbers would have been smaller, if anything.

October 29, 16,500, absent.

Now, then, we go to November.

November 15, 9,000.

Coli tests not made in the November samples at this point.

November 16, 38,000,
" 17, 19,500,
" 18, 13,500,
" 21, 68,500,

368 And that is the last. There are seven samples in the examination.

Q. Now, then, with reference to the examination made of the water at Peoria, the dates you give will be the dates that the sample was collected, and it was carried immediately to the laboratory at Peoria and examined?

A. Yes, plated at once.

Q. And the tests made that day?

A. Yes, sir. Beginning October 1, three miles above Peoria, quantitative determination of bacteria per cubic centimeter, and the results of the tests for the coli.

October 1, 2,350, coli present,
" 2, 2,500, absent,
" 3, 1,750, present,
" 4, 350, "
" 5, 300, "
" 6, 230, absent,
" 7, 290, present,
" 8, 660, "
" 9, 320, "
" 10, 360, "
" 11, 200, "
" 12, 750, "

October 13, 5,800, present,
“ 14, 390, “
369 “ 15, 500, “
“ 16, 220, “
“ 17, 220, “
“ 18, 220, “
“ 19, 150, “
“ 20, no numbers counted, but coli present,
“ 21, do do
“ 22, 300, present,
“ 23, 360, “
“ 24, 280, “
“ 25, numbers not counted; coli absent,
“ 26, 350, present,
“ 27, 510, “
“ 28, 350, “
“ 29, 550, “
“ 30, 1,200, “
“ 31, 350, absent,

That is all for October.

Q. Now, Doctor, on the 20th, 21st and 25th, I notice you say no numbers counted. Does that mean no bacteria found?

A. No, it means that the sample was lost. That is, a man drops a plate, or a plate liquifies on him, before he can count it. Those are little accidents that occur in bacteriological laboratories, in spite of all one can do.

Q. What is the next?

A. November, the same place. Bacteria per cubic centimeter.

370 November 1, 1,300, absent,
“ 2, 600, “
“ 3, 350, present,
“ 4, 250, “
“ 5, no count made, but coli present,
“ 6, 350, present,
“ 7, 120, present,
“ 8, 140, present,
“ 9, 350, present,
“ 10, 220, test not made,
“ 11, 230, present,

November 12, 450, present,
“ 13, 2,450, “
“ 14, 3,700, “
“ 15, 3,800, absent,
“ 16, 4,300, present,
“ 17, 6,500, “
“ 18, 2,500, “
“ 19, 750, “
“ 20, 2,300, “
“ 21, 1,300, absent,
“ 22, 4,600, “
“ 23, 9,000, present,
“ 24, 3,850, “
“ 25, 2,700, “
371 “ 26, 360, coli test not made,
“ 27, 1,860, do.

That is the last sample taken in November.

Pekin Bridge, Pekin, Illinois.

Q. Now, those samples were collected and returned to the laboratory at Pekin on the same day?

A. They were taken to Peoria. There is a street car that runs from Pekin to Peoria. The samples were collected and carried right to Peoria.

Q. And an examination made immediately?

A. Made at once. The collector collected the samples. The bacteriologist remained in the laboratory, and when the sample was brought to him, it was immediately used.

Q. This was after all the Peoria sewage had got in the river?

A. Yes, it was about five miles below.

Q. About five miles below Peoria?

A. Yes, sir.

JUDGE SPRINGER: But not Pekin?

A. It is above Pekin. Bacteria per cubic centimenter, quantitive determination and result of tests for coli communis.

October 1, 1,170, present,
“ 2, —

It is above the railroad bridge in the channel at Pekin, Illinois, five miles below the lowest Peoria sewer.

372 October 2, 24,000, present,

October 3, 96,000, present,
" 4, 25,000, "
" 5, 27,000, "
" 6, 14,500, "
" 7, 15,800, "
" 8, 48,000 "
" 9, 26,000, "
" 10, 5,800, "
" 11, 5,900, "
" 12, 23,500, "
" 13, 4,000, "
" 14, 1,300,000, "
" 15, 12,700, "
" 16, 5,000, "
" 17, 8,500, "
" 18, 57,500, "
" 19, 433,000, "
" 20, 36,500 "
" 21, 4,000, "
" 22, 7,500, "
" 23, 5,000, "
" 24, 4,500, "
" 25, sample lost, present,

That is, the bacterial plate apparently was lost.

373 " 26, 9,800, present,
" 27, 2,500, "
" 28, 400, "
" 29, 3,900, "
" 30, 5,000, "
" 31, 26,000, absent.
November 1, 16,500, absent,
" 2, 9,500, present,
" 3, 6,400, present,
" 4, 3,500, present,
" 5, 2,900, present,
" 6, 4,700, present,
" 7, 4,000, present,
" 8, 4,200. present,
" 9, 4,100, present,
" 10, 8,900, present,

November 11, 20,500, present,
“ 12, 3,600, present,
“ 13, 2,200, “
“ 14, 2,600, “
“ 15, 7,300, “
“ 16, 7,900, “
“ 17, 2,600, “
“ 18, 3,500, “
374 “ 19, 750, present,
“ 20, 4,000, “
“ 21, 4,200, “
“ 22, 7,600, “
“ 23, 7,500, coli test not made,
“ 24, 4,300, do.
“ 25, 1,950, do.
“ 26, 400, do.
“ 27, 2,200, do.

That is all the samples collected at that place.

Q. Now at Kingston, where was the examination made?

A. In the channel at Kingston, three miles below Pekin, I think it is.

Q. That is, the test was made there?

A. The sample was obtained and the test made at Peoria, traveling by train. Sample collected by a collector and taken directly to the laboratory and there plated.

Q. It may have been the same day that the sample was collected?

A. Yes, it was within a few minutes after being taken.

Q. Now, you say Kingston is about three miles below Pekin?

A. Yes sir.

Q. Where were those samples taken with reference to Kingston?

A. Well, they were taken well below Kingston. A man
375 went down in a buggy as far as he could drive and drove
out into the stream and collected this sample. The river
was low during this time.

Q. He collected them from the current?

A. Yes sir, from the current of the river some distance below Kingston.

Q. Now, you may give the result of the tests at Kingston.

A. The quantitative determination of bacteria and examination of water collected below Kingston per cubic centimeter and tests for the bacilli communis.

October 4, 1901, 285,000, present.

This is the water of Peoria and Pekin together, you see.

October 5, 440,000, present,
“ 6, 137,500, present,
“ 7, 797,500, present,
“ 8, 94,000, present,
“ 9, 530,000, present,
“ 10, 485,000, present,
“ 11, 225,000, present,
“ 12, 487,500, present,
“ 13, 320,000, present,
“ 14, 1,120,000, present,
“ 15, 400,000, present,
“ 16, 67,500, present,
376 “ 17, 122,500, present,
“ 18, 174,000, “
“ 19, 258,000, “
“ 20, 950,000, “
“ 21, 4,000, “
“ 22, 118,500, “
“ 23, 99,000, “
“ 24, 100,000, “
“ 25, 17,500, “
“ 26, 529,500, “
“ 27, 213,000, “
“ 28, 3,300, “
“ 29, 2,115,500, “
“ 30, 287,500, “
“ 31, 365,000, “
November 1, 54,000, absent,
“ 2, 1,750,000, “
“ 3, 26,500, present,
“ 4, 21,500, “
“ 5, 16,500, “
“ 6, 14,500, “

November 7, 33,000, present,
" 8, 65,000, "
" 9, 62,000, "
377 " 10, 61,000, "
" 11, 42,000, "
" 12, 60,000, "
" 13, 36,000, "
" 14, 10,500, "
" 15, 14,500, "
" 16, 12,900, "
" 17, 16,500, "
" 18, 31,500, "
" 19, 12,500, "
" 20, 16,500, "
" 21, 18,500, "
" 22, 39,400, "
" 23, 25,300, coli test not made,
" 24, 28,000, "
" 25, 6,500, "
" 26, 10,000, "
" 27, 9,300, "

That is the end of Kingston.

Q. Now explain, doctor, where the samples were taken from at Beardstown?

A. The Beardstown sample was taken in the river above Beardstown, right out from in front of it, in front of the town.

Q. Now where were the examinations made, the tests?

378 A. The samples were packed in ice and shipped to Peoria where they were examined in the bacterial laboratory by Dr. Rush.

Q. Well, you say the samples were gathered just above Beardstown?

A. Yes sir.

Q. And packed in ice and shipped to Peoria?

A. Yes sir.

Q. How long would it take to ship them to Peoria and have the tests made after they were gathered?

A. In a very short time, depending upon the train. It is a very short distance from Beardstown, a couple of hours.

Q. It may have been made that same day?

A. Most always made the same day.

Q. And you stated—

A. They were made the same day. They were shipped to Peoria, so that they would arrive in Peoria and be plated that same day.

JUDGE SPRINGER: You didn't superintend that part of it?

A. No, I didn't superintend that part of it, but I saw it was working right.

MR. JEFFRIES: You had general charge of it?

A. Yes sir, I traveled up and down from those points
379 all the time. The distance from Beardstown to Peoria
is very short.

ATTORNEY GENERAL HAMLIN: Did you ever travel over it?

A. Yes, I traveled over it on the Bluff line.

Q. By rail?

A. Yes sir, I have traveled it quite a number of times, and also by boat.

MR. JEFFRIES: Give us the result of that examination.

A. All right.

October 24, 4,400, test not made,
" 27, 4,850, coli test not made,
" 29, 3,950, "
" 30, 4,300, "
" 31, 4,950, "

" 8, 77,500, "
" 9, count not made; coli present,
" 10, " "
" 11, 40,000, present.
380 " 12, 34,500, present,
" 13, 85,000, present,
" 14, 51,500, present,

November 15, 45,000, present,
“ 16, numbers not counted; present,
“ 17, numbers not recorded; present,
“ 18, 148,500, present,
“ 19, numbers not recorded; present,
“ 20, 28,500, present,
“ 21, 52,000, present,
“ 22, 185,000, “
“ 23, coli present; numbers not counted.
“ 24, “ “
“ 25, 378,500, present,
“ 26, 185,000, “
“ 27, 46,500, “

Adjourned until 2:15 p. m. February 20th.

2:15, p. m., Friday, February 20, 1903.
381 Continuation after recess.
Present, the Commissioner, and same counsel as before.

DR. AMAND NICHOLAS RAVOLD

resumed the stand for further direct examination by Mr. Jeffries.

Q. Now, the next examination, doctor, during this third period, of the waters in the Illinois river, was where?

A. At Grafton, Illinois; a laboratory was established in the Dempsey House under the charge of Mr. Leon G. Tedesche, and with collectors, he collected samples from the Illinois river three miles above Grafton.

Q. And Grafton, you stated the other day, was about 160 miles below Peoria?

A. Yes sir.

Q. Now, when were these collections made, in the third period?

A. For the quantitative determination of bacteria per cubic centimeter and examination for the bacillus coli communis were begun October 4, and continued until the 27th of November, 1901.

Q. Do you know the percentage of colon bacillus that was found in the samples for October, 1901?

A. Yes sir. October, 1901, 53.6 per cent., for the two
382 months.

Q. For November of the same year?

MR. HAMLIN: The entire time, that is?

A. Yes, 53.6 per cent.

MR. HAMLIN: From October 1st?

A. From October 4 to November 27. For October, 1901, the coli was found in 53.6 per cent. of the cases.

MR. JEFFRIES: And for November?

A. For November, 29.17 per cent.

Q. Now then, state the average for the two months.

A. An average of 45 per cent.

Q. Where did you say the laboratory was located?

A. It was in the Dempsey House in Grafton.

Q. Now you commenced taking samples on the 4th day of October, you say?

A. Yes sir.

Q. Were those samples examined and worked on the day that they were taken?

A. Yes sir, collected by the bacteriologist, and they collected together as a rule and brought them right back to the laboratory and examined them at once.

Q. How far is the laboratory situated from where the samples were taken?

A. Three miles on the Illinois.

383 Q. Now they were taken from the middle of the stream, were they?

A. Yes, out in the current, in the channel.

Q. Three feet below the surface?

A. About three feet below the surface.

Q. Taken with this same apparatus that you testified to two days ago?

A. Yes sir.

Q. And the same precautions were used and the same instruments were used?

A. Yes sir.

Q. Now you may commence and give the result of those experiments.

A. The quantitative determination and coli?

Q. Yes.

A. October 4, Grafton, Illinois river, 1,400, bacillus coli present.

October 5, 1,600, bacillus coli absent,
" 6, 1,800, " " present,
" 7, 1,700, present,
" 8, 1,100, "
" 9, 1,200, absent,
" 10, 1,300, present,
" 11, 1,200, absent,
" 12, 1,000, "
384 " 13, 1,300, coli absent,
" 14, 800, "
" 15, 1,300, coli present,
" 16, 850, present,
" 17, 900, present,
" 18, 1,000, present,
" 19, 2,000, present,
" 20, 2,100, absent,
" 21, 1,600, absent,

“ 23, 4,200, absent,
” 24, 4,800, present,
“ 25, 1,800, test not made for coli,
“ 26, 4,900, do.
“ 27, 2,600, do.

That is the last for the Illinois river at Grafton.

Q. State whether or not at this same time there was an examination made from samples of water collected from the Mississippi river near Grafton?

386 A. Yes sir.

Q. Where was that collected?

A. It was collected from two miles above Grafton on the Mississippi.

Q. At what particular place in the river?

A. In the channel.

Q. Selected in the same manner as the water selected in the Illinois river above Grafton?

A. Yes sir.

Q. With the same apparatus and under the same precautions?

A. Under the same precautions, yes sir.

Q. Now where was the test made of those samples?

A. These samples were carried directly to the bacteriological laboratory in the Dempsey House in Grafton and there immediately plated.

Q. The same day that they were obtained?

A. Yes sir.

Q. Now you may give the results of those examinations.

A. Mississippi river, quantitative determination of bacteria per cubic centimeter and tests for the bacillus coli communis, Mississippi river two miles above Grafton.

October 4, 500, coli present,
“ 5, 1,500, absent,
“ 6, 1,300, present,
387 “ 7, 850, absent,
“ 8, 1,100, present,
“ 9, 450, absent,
“ 10, 275, absent,
“ 11, 275, absent,
“ 12, 750, absent,
“ 13, 400, absent,
“ 14, 1,100, present,
“ 15, 900, present,
“ 16, 850, present,
“ 17, 425, present,
“ 18, 400, present,
“ 19, 400, absent,
“ 20, 750, absent,
“ 21, 1,000, absent,
“ 22, 650, absent,
“ 23, 475, absent,
“ 24, 425, absent,
“ 25, 1,100, absent,
“ 26, 350, absent,
“ 27, 500, absent,
“ 28, 650, absent,
“ 29, 900, absent,
“ 30, 850, present,
“ 31, 850, present.

388 So much for October.

November 1, 850, coli present,
“ 2, 850, absent,
“ 3, 1,200, absent,
“ 4, 1,200, present,
“ 5, 1,300, present,
“ 6, 1,300, absent,
“ 7, 1,200, present,
“ 8, 1,200, absent,
“ 9, 800, present,

November 10, 1,000, absent,
" 11, 475, absent,
" 12, 1,000, present,
" 13, 800, present,
" 14, 1,200, present,
" 15, 1,600, present,
" 16, 1,900, absent,
" 17, 2,600, absent,
" 18, 2,000, present,
" 19, 4,100, present,
" 20, 2,700, present,
" 21, 2,800, present,
" 22, 2,600, absent,
" 23, 3,500, present,
" 24, 6,600, present,
389 " 25, 3,600, coli present,
" 26, 5,500, do.
" 27, 7,400, do.

That is the end of that.

Q. Can you give the percentage of instances in which the coli was found present in the samples taken from the Mississippi river above Grafton?

A. This is Mississippi river water above Grafton; this is October, the Mississippi river, 33.33 per cent. Mississippi river for November 62.50 per cent. Total per cent. 47.

Q. For the two months?

A. For the two months, yes. Those two rivers run very uniformily.

Q. Now, doctor, during this same period an examination was made from tests of water taken from Mississippi river at Chain of Rocks at three distinct places, as I understand?

A. Yes sir.

Q. State, please, the different places where the samples were taken?

A. Samples were taken at Mississippi river, at Alton, Illinois, that is one mile above Alton; Mississippi river, Hartford, Illinois; Missouri river, Ft. Bellefontaine; intake tower, Chain of Rocks, Illinois shore; Chain of Rocks, Missouri shore; Chain of Rocks, outlet screen chamber reservoir; Chain of Rocks, outlet stream chamber, basin, Bissell's point; tap in the

390 city chemist's office, 1141 Market street; tap at 5946 Garfield avenue.

Q. Now give the dates of the commencement of this series of tests to the end or conclusion.

A. Beginning at the intake tower—

Q. No, the date now. Give the date the first test was taken, the first sample of water was taken.

A. Well, the first samples of water during this investigation were taken at the intake tower beginning at St. Louis September 14.

Q. Now continuously on until when?

A. And from that on until November 30. While the samples from the Missouri river at Ft. Bellefontaine, Mississippi river at Hartford, Illinois, and Mississippi river at Alton, Illinois, began October 4, October 5, October 6, rather, for Hartford, Illinois; and October 5 for Alton.

Q. These samples seem to have been taken at different dates, and we will take up each one and give the date as we go through it.

A. Yes. Now where do you wish me to begin?

Q. Commence at the Chain of Rocks, the three different samples.

A. Don't you think we had better go down the river, Mr. Jeffries, and begin up here at Alton?

Q. All right.

391 A. If you begin below Alton, just below Hartford, and the Missouri, you will have these things in sequence.

Q. One mile above Alton, when did that commence?

A. That began on October 5—the first sample was taken, 1901. This was for the quantitative determination of bacteria per cubic centimeter and result of test for bacillus coli communis, Mississippi river one mile above Alton, Illinois.

Q. That was taken in the channel of the river?

A. That was taken in the channel of the river.

Q. Where were those samples taken?

A. They were collected from a boat, taken ashore and brought back to St. Louis, carried there by the collector.

Q. The same day they were collected?

A. The same day they were collected, they were collected at ten o'clock, and arrived at the laboratory about two, packed in ice.

Q. They were plated at once?

A. They were plated at once, plated that same day; they came, packed in ice.

October 5, 1,200 per cubic centimeter, coli present,
" 6, 250, coli bacillus present,
" 7, 100, do.
" 8, 750, do.
" 9, sample lost, coli present,
" 10, 330, coli present,
392 " 11, 750, coli present,
" 12, 600, "
" 13, 675, "
" 14, 425, "
" 15, 500, "
" 16, 650, "
" 17, 1,050, "
" 18, 900, "
" 19, 1,700, "
" 20, 1,360, "
" 21, 1,500, "
" 22, 1,100, "
" 23, 1,900, "
" 24, 1,700, "
" 25, 1,700, "
" 26, 1,700, "
" 27, estimation not made; coli present,
" 28, 1,700, coli present,
" 29, 1,700, "
" 30, 2,100, "
" 31, 2,500, "

That was for October.

Q. Now take November.

393 A. November 1, 1,500, coli present,
" 2, 1,200, "
" 3, 800, "
" 4, 1,300, coli absent,
" 5, 1,000, coli test not made,
" 6, 700, do.

November 7, sample lost,
" 8, numbers not made, but coli absent,
" 9, 1,300, coli present,
" 10, 1,000, "
" 11, 1,100, "
" 12, 1,200, "
" 13, 1,500, coli absent,
" 14, 2,100, coli present,
" 15, 2,000, "
" 16, 1,800, "
" 17, 1,300, "
" 18, 1,400, "
" 19, 1,500, "
" 20, 1,200, absent,
" 21, 1,500, absent,
" 22, 1,500, absent,
" 23, 1,600, absent,
" 24, 1,600, absent,
" 25, 2,700, present,
" 26, 2,200, absent,
394 " 27, 3,100, coli absent,
" 28, sample lost,
" 29, 2,300, coli present,
" 30, 2,000, "

So ends that story. There is wounderful uniformity in those numbers.

Q. Now will you take the Mississipi river at Hartford?

A. Hartford, Illinois.

JUDGE SPRINGER: Where is that?

A. Hartford is six or seven miles below Alton and one mile above the mouth of the Missouri river, where it empties into the Mississippi river.

MR. JEFFRIES: And how far below the mouth of the Illinois river where it empties into the Mississippi river?

A. I don't remember exactly, we have got those figures down though somewhere.

Q. About how far?

A. It was 39 miles from the mouth, to the mouth of the Missouri, about 30 miles, 27 to 30 miles.

MR. HAMLIN: Hartford is located below Alton?

A. Yes sir.

Q. How many miles?

A. About 6 or 7 miles by river.

MR. JEFFRIES: Now those samples were sent to St. Louis, were they?

A. Yes sir. They were brought to St. Louis by the col-
395 lector, immediately after being taken, and reached the
laboratory about two o'clock.

Q. They were plated immediately?

A. They were plated immediately, yes sir.

Q. Now we will have the result of the investigation.

A. Beginning October 6, the quantitative determination of the number of bacteria per cubic centimeter and the tests for bacilli coli communis at Hartford, Illinois, on the Mississippi river:

October 6, 450, coli present.
" 7, 950, "
" 8, 1,600, "
" 9, 850, "
" 10, 300, "
" 11, 300, "
" 12, 1,700 "
" 13, 3,250, "
" 14, 600, "
" 15, 650, "
" 16, 500, "
" 17, 2,000, "
" 18, 1,700, "
" 19, 2,300, "
" 20, 2,500, "
" 21, 1,400, "
396 " 22, 1,670, "
" 23, 4,400, coli absent,
" 24, 4,200, coli present,
" 25, 1,480, "
" 26, 4,200, "
" 27, sample lost; coli present. That is no numbers taken, but coli present.
" 28, 3,500, coli present,
" 28, sample numbers lost; coli present,

October 30, 8,200, coli absent,
" 31, 1,000, "
November 1, 750, coli absent,
" 2, 1,600, coli present,
" 3, 5,300, coli absent,
" 4, 1,700, coli present,
" 5, 2,900, coli test not made,
" 6, 2,300, "
" 7, sample lost,
" 8, 1,100, coli absent,
" 9, 2,000, coli present,
" 10, the numbers not recorded, but coli present,
" 11, 9,800, coli present,
" 12, 3,300, "
397 " 13, 1,300, coli present,
" 14, 3,100, coli absent,
" 15, 1,400, "
" 16, 2,100, coli present,
" 17, 1,300, coli absent,
" 18, 400, "
" 19, 1,300, "
" 20, 1,100, "
" 21, 2,500, coli present,
" 22, 1,800, coli absent,
" 23, 2,300, "
" 24, 3,000, present,
" 25, 4,400, coli absent,
" 26, 5,100, "
" 27, 9,500, coli test not made,
" 28, sample lost,
" 29, 5,700, coli present,
" 30, 4,300, coli absent.

That is all for that story.

MR. SPRINGER: That ends Hartford?

A. That ends Hartford. You see sometimes a little effect of the Alton sewage on the numbers of bacteria. The next place, the Missouri river.

MR. JEFFRIES: Missouri river at Ft. Bellefontaine?

398 A. Yes sir.

Q. That is how far from the mouth of the Missouri?

A. Six miles above the mouth of the Missouri where it empties into the Mississippi river.

Q. Now, when did you commence taking samples of water there?

A. Began October 4.

Q. Now, how soon after the samples were collected until they were plated?

A. They were collected by one collector, who took this one sample; he got that sample about ten o'clock in the morning and returned at once to the laboratory, reaching there about two o'clock—between noon and two o'clock.

Q. Was that at the Chain of Rocks?

A. He took a train to Ft. Bellefontaine and came right back again.

Q. Back to St. Louis?

A. Yes sir.

Q. That is, back to your office?

A. Yes, he left the office and went right out there and then back that same day, as fast as he could come back with the train that brought him back; he regulated his time accordingly.

This is for the quantitative determination of the number of bacteria in samples of water collected at Ft. Bellefontaine on the Missouri river, and for the result of the tests
399 for the detection of the bacillus coli communis.

October 4, 7,000, coli test not made,
" 4, 19,200, coli present,
" 5, 19,200, coli present,
" 6, 3,100, coli present,
" 7, 2,250, "
" 8, 22,500, "
" 9, 10,500, "
" 10, 9,200, "
" 11, 10,800, "
" 12, 5,000, "
" 13, 6,000, "
" 14, 104,600, "
" 15, 53,500, "

There must have been a rain up there.

October 16, 6,400, coli present,
" 17, 21,400, "
" 18, 26,000, "

October 19, 37,600, coli absent,
" 20, 52,300, coli present,
" 21, 20,400, coli absent,
" 22, 48,700, coli present,
" 23, 34,700, "
" 24, 34,700, "
" 25, 37,300, "
" 26, 35,900, "
400 " 27, 35,000, "
" 28, 40,000, "
" 29, 37,200, "
" 30, 32,000, "
" 31, 29,400, "

That is October.

Q. Now you are in November.

A. November 1, 25,900, coli present,
" 2, 25,800, "
" 3, 22,100, "
" 4, 28,200, coli absent,
" 5, 15,200, coli test not made,
" 6, 30,000, "
" 7, 20,000, "
" 8, 10,300, coli present,
" 9, 31,000, "
" 10, 34,400, coli absent,
" 11, 54,000, coli present,
" 12, 43,500, "
" 13, 69,700, "
" 14, 69,700, "
" 15, 41,900, "
" 16, 20,000, coli absent,
" 17, 7,800, coli present,
" 18, 11,200, coli absent,
401 " 19, 37,300, coli test not made,
" 20, 49,000, coli present,
" 21, 41,500, "
" 22, 46,000, coli absent,
" 23, 59,200, coli present,
" 24, 60,400, "
" 25, 63,000, coli test not made,

November 26, 26,500, coli present,
“ 27, 45,700, “
“ 28, sample lost,
“ 29, 49,700, coli present,
“ 30, 68,600, “

That is the end of that.

MR. SPRINGER: The next place is what?

A. The next place we go to the intake tower.

MR. JEFFRIES: That is down at the Chain of Rocks?

A. That is on the Chain of Rocks.

MR. SPRINGER: This is the nearest point to the intake?

A. We can begin on the Missouri, Illinois shore, or intake tower.

MR. JEFFRIES: Now explain how that was done first.

A. A cross section was taken of the river here about 100 yards—

ATTORNEY GENERAL CROW: What do you mean
402 by cross section?

A. A line drawn across the river—

MR. CROW: I know what you mean, but I want the record to show.

A. At 300 yards from the Missouri shore, a sample was taken. This is above the intake, about 100 yards. That is a line drawn from the shore through the intake. The second sample or what is known as the intake tower sample was taken in front of the intake tower anywhere from 100 to 300 feet in front of it, as the man rowed across the river. And the third sample was taken on the Illinois shore, 300 yards from the shore in the channel.

MR. SPRINGER: 300 yards or 300 feet?

A. 300 yards. 300 feet would be in the shallow water there.

MR. SPRINGER: That would be 900 feet, then.

A. That would be 900 feet at least.

MR. JEFFRIES: Where were those samples taken afterwards?

A. They were taken ashore and plated immediately, and then the plates when the gelatine solidified were carried to the bacteriological laboratory at 1141 Market street, the city chemist's office, and there incubated, and counted when ripe.

Then we will begin with this Missouri shore-sample, shall we?

Q. Yes, we will commence with the Missouri shore sample.

403 MR. SPRINGER: Intake tower, Chain of Rocks.

A. Yes, the Missouri shore, Chain of Rocks.

MR. SPRINGER: That is 300 yards out?

A. 300 yards from the shore.

MR. JEFFRIES: And just above—

A. Just above a line drawn through the intake. You see it is impossible to get a sample below there because it is rocky, a chain of rocks has been thrown out into the river to deflect the water away from the shore, so it would be shallow water below the chain of rocks; consequently the samples were taken above the chain of rocks, where the water was deep.

September 14, for the quantative determination, of the number of bacteria per cubic centimeter in samples collected at the Missouri shore, Chain of Rocks, and for the detection of the bacillus coli communis, per one cubic centimeter of water.

September 14, 1,000, bacillus coli test not made.
“ 16—we jump the 15th there; no test.
“ 16, 900, coli test not made,
“ 17, 700, coli present,
“ 18, 600, “
“ 19, 1,000, coli absent,
“ 20, 2,400, coli present,
“ 21, 325, test not made,
“ 22, 2,800, coli present,
404 “ 23, 350, coli absent,
“ 24, sample lost, coli not present,
“ 25, numbers not recorded; coli present,
“ 26, 7,200, coli present,
“ 27, 7,100, “
“ 28, 10,700, “
“ 29, 2,500, “
“ 30, 2,100, “
October 1, 1,800, coli present,
“ 2, 4,900, test not made,

October 3, 3,500, coli present,
“ 4, 4,500, “
“ 5, 7,950, “
“ 6, 2,500, “
“ 7, 2,800, “
“ 8, 12,300, “
“ 9, 8,100. “
“ 10, 9,000, “
“ 11, 11,300, “
“ 12, 7,000, “
“ 13, 4,000, coli absent,
“ 14, 5,400, coli present,
“ 15, 9,600, “
“ 16, 8,600, “
405 “ 17, 10,800, “
“ 18, 28,100, “
“ 19, 26,400, “
“ 20, 42,100, “
“ 21, 33,200, “
“ 22, 31,900, “
“ 23, sample lost; coli present,
“ 24, 28,600, coli present,
“ 25, 36,400, “
“ 26, 29,900, “
“ 28, 20,800, “
“ 29, 24,700, “
“ 30, 24,000, “
“ 31, 31,000, “

So much for October. They run uniformly with the Missouri, you will notice.

Now begins November. Missouri shore, Chain of Rocks, November 1, 22,800, coli present.

November 2, 22,400, coli present,
“ 3, 21,100, “
“ 4, 17,300, coli absent,
“ 5, 10,700, coli test not made,
“ 6, 18,300, “
“ 7, 17,400, “
“ 8, 11,600, coli present,
406 “ 9, 23,400, “

November 10, 22,300, coli present,
" 11, plate lost; coli bacillus present,
" 12, 43,800, coli present,
" 13, 66,300, "
" 14, 56,200, "
" 15, 33,700, coli absent,
" 16, 61,500, "
" 17, 59,000, coli present,
" 18, 66,000, present,
" 19, 48,700, coli present,
" 20, 44,500, "
" 21, 42,700, "
" 22, 42,200, coli absent,
" 23, 50,600, coli present,
" 24, 35,000, "
" 25, 28,100, "
" 26, 42,500, "
" 27, 4,100, "
" 28, sample lost,
" 29, 37,300, coli present,
" 30, 52,500, "

MR. JEFFRIES: Now give us the result of the examination on the Illinois shore during this same period.

A. All right. Illinois shore, Chain of Rocks, quantative
407 determination of the number of bacteria in samples collected at this point, together with the results of the test for the baccillus coli communis, quantity of water per one cubic centimeter.

September 14, 700, coli test not made,
" 15, sample not taken,
" 16, 450, coli test not made,
" 17, 550, coli present,
" 18, 375, coli test not made,
" 19, 510, coli absent,
" 20, 1,000, coli present,
" 21, 1,800, coli present,
" 22, 3,000, coli absent,
" 23, 22,500, coli present,
" 24, 2,100, "
" 25, 1,500, "

September 26, 1,500, coli present,
" 27, 4,800, "
" 28, 1,700, coli absent,
" 29, 1,700, coli present,
" 30, 1,500, "

So much for September.

Q. Now as to October?

A. October, the Illinois shore, bacteria per cubic centimeter.

408 October 1, 1,800, bacilli coli communis present,
" 2, 1,800, coli test not made,
" 3, 2,200, coli present,
" 4, 2,500, "
" 5, 4,600, "
" 6, 23,500, "
" 7, 650, "
" 8, 1,700, "
" 9, 8,600, "
" 10, 16,800, "
" 11, 3,600, "
" 12, 1,800, "
" 13, 5,500, "
" 14, 1,900, "
" 15, 1,200, "
" 16, 800, "
" 17, 1,200, "
" 18, 2,300, "
" 19, 2,200, coli absent,
" 20, 2,300, coli present,
" 21, 2,700, "
" 22, 2,200, "
" 23, 3,100, "
" 24, 3,600, "
" 25, 2,800, "
" 26, 1,900, "
409 " 27, 1,300, "
" 28, 410, "
" 29, plate lost; coli present,
" 30, 2,300, coli present,
" 31, 2,500, "

Are you ready for November?

MR. SPRINGER: Yes.

A. Illinois shore, November 1, 1,900, coli present,
November 2, 9,800, coli absent,
“ 3, 2,400, coli present,
“ 4, 2,000, coli absent,
“ 5, 1,500, coli test not made,
“ 6, 1,500, “
“ 7, 2,200, “
“ 8, plate lost; coli present,
“ 9, 2,100, coli present,
“ 10, 2,300, “
“ 11, 2,800, “
“ 12, 2,200, “
“ 13, 2,400, “
“ 14, 2,000, “
“ 15, 3,100, coli absent,
“ 16, 2,100, coli present,
“ 17, 2,000, “
“ 18, 2,400, “
“ 19, 2,100, coli absent,
410 “ 20, 1,700, coli present,
“ 21, 1,400, “
“ 22, 4,000, “
“ 23, 2,500, “
“ 24, 2,600, coli absent,
“ 25, 3,000, “
“ 26, 7,500, coli present,
“ 27, 7,800, “
“ 28, sample lost,
“ 29, 5,500, coli present,
“ 30, 7,200, “

MR. SPRINGER: That was Illinois shore?

A. That was the Illinois shore.

MR. JEFFRIES: That is the last of the test of the water taken from the Illinois shore, or near the Illinois shore?

A. Yes, sir.

Q. Now, we will take the results of the test taken at the intake.

A. Yes, sir. These were taken at the intake tower from

100 to 300 feet above the tower in the river where the river was running fast.

MR. SPRINGER: This was not taken in the intake tower itself?

A. No. The intake tower is there, 1,500 feet from the
shore, and the samples were taken in the channel in front
411 of it. It is difficult to take a sample in a tower, because
the water is pouring into it from all sides, and it is very
difficult for a man to get down there.

MR. SPRINGER: This is the intake?

A. This is intake, sample of water that was taken in front of the tower, of water that was running in there, comparative tests showed the bacterial contents to be alike.

Intake tower, Chain of Rocks, September 14.

This is intake tower, Chain of Rocks, for the quantative determination of the number of bacteria per cubic centimeter, and the result of tests for bacillus coli communis, intake tower, Chain of Rocks.

MR. SPRINGER: Is that all of that?

A. That is the end of that. We go to outlet screen chamber, Chain of Rocks.

MR. JEFFRIES: Is that in the reservoir?

A. Yes, that is in the reservoir.

MR. SPRINGER: This is after sedimentation?

A. Yes, this is after 70 hours' rest in the reservoirs now.

MR. SPRINGER: How does this one compare with that one a year ago?

415 A. I think it is about the same, or a little bit better during that time. I think there wasn't so many bacteria in the water.

MR. JEFFRIES: Now, an examination also was made at the outlet screen in the chamber of the Chain of Rocks?

A. Yes, sir; of the reservoir of the Chain of Rocks.

Q. Those samples were taken from the same place?

A. Yes, sir.

Q. In the outlet screen, same as in period No. 2, the second period testified to a few days ago?

A. Yes, I think it was reservoir No. 3, but it makes no difference. They have one of those reservoirs—it is after the subsidence.

Q. Where were those samples taken after they were collected?

A. They were taken as soon as they were collected, they were taken to the house or pumping station there, and plated immediately.

Q. And the plates were—

A. And the plates were put into a special apparatus designed by Mr. Damon and carried to the city chemist's office, 1141 Market street, and there incubated and counted afterwards.

Q. Now, let us have the result from those examinations, giving the dates.

A. Quantative determination of the bacteria per cubic
416 centimeter and the results of the tests for the bacillus coli communis.

Outlet screen chamber, Chain of Rocks reservoir.

September 14, 350, test for bacilli coli communis not made,
" 15, sample lost,

" 20, 6,200, "
" 21, 7,100, "
" 22, 6,600, "
" 23, 6,300, "
" 24, 7,500, "
" 25, 1,200, "
" 26, 11,400, "
" 27, 5,400, "
" 28, 6,900, "
418 " 29, 7,200, "
" 30, 7,700, "
" 31, 6,200, "

Now comes November.

November 1, 6,800, coli present,
" 2, 5,600, "
" 3, 5,900, "
" 4, 5,600, "
" 5, 6,400, coli test not made,
" 6, 5,300, "
" 7, 6,500, "
" 8, 5,000, coli present,
" 9, 6,300, "
" 10, 6,600, coli test not made,
" 11, 6,300, coli present,
" 12, 6,200, "
" 13, 8,100, "
" 14, 6,100, "
" 15, 10,000, "
" 16, 11,800, "
" 17, 8,200, "

November 18, 10,700, coli present,
" 19, 6,300, "
" 20, 7,500, "
419 " 21, 10,800, "
" 22, 14,100, "
" 23, 12,200, "
" 24, 7,800, "
" 25, 5,600, "
" 26, 7,800, "
" 27, 7,900, "
" 28, sample lost,
" 29, 4,600, coli absent,
" 30, 8,400, "

That is the end of that outlet screen business.

MR. JEFFRIES: Now, during this same period at this same time, was there an examination made of the water in the settling basin at Bissell's Point, as I understand it?

A. Yes, outlet station, settling station, Bissell's Point.

Q. Now, those samples were taken out of the settling basin?

A. Out of the settling basin outlet, where the water was flowing out into the deep well there.

Q. What became of the samples taken from there?

A. The samples were taken by Mr. Damon himself and brought directly to the laboratory and plated—plated at 1141 Market street.

Q. And from that they were developed?

A. They were brought right back. He went out in the
420 morning and took the samples at the outlet screen, the
samples at the large reservoir, and then took the Chain
of Rock samples and came back that way, but it was plated
within a half an hour after he took it.

Q. Now give us the results of those tests?

A. Results, September 16, is the first number, bacteria per cubic centimeter:

September 16, 200, test not made,
" 17, 100, "
" 18, 100, "
" 19, 140, "
" 20, 80, "
" 21, 250, coli present,

September 22, 150, coli absent,
" 23, 120, coli present,
" 24, 340, coli test not made,
" 25, 700, coli present,
" 26, 1000, "
" 27, 750, "
" 28, 850, "
" 29, 325, "
" 30, 350, "

Q. Now for the month of October.

A. Outlet to settling basins, October:

421 October 1, 300, coli absent,
" 2, 650, coli test not made,
" 3, 450, coli absent,
" 4, 550, coli present,
" 5, 380, "
" 6, 575, "
" 7, 200, "
" 8, plate lost; coli present,
" 9, 1200, coli present,
" 10, 1200, "
" 11, 475, "
" 12, 700, "
" 13, 450, "
" 14, 725, "
" 15, 600, "
" 16, 750, coli absent,
" 17, 1500, coli present,
" 18, 1700, "
" 19, 2400, "
" 20, 1800, "
" 21, 1800, "
" 22, 2400, "
" 23, 1900, "
" 24, 1700, "
" 25, 1700, "
" 26, 1200, "
422 October 27, 1250, coli present,
" 28, 1130, coli absent,

October 29, plate lost; coli present,
“ 30, 1600, coli present,
“ 31, 1500, “
November, 1, 1600, “
“ 2, 8700, “
“ 3, 1100, “
“ 4, 1600, “
“ 5, 1000, coli test not made,
“ 6, 1000, “
“ 7, 1400, “
“ 8, 1300, coli present,
“ 9, 1800, “
“ 10, 2500, “
“ 11, 1870, “
“ 12, 3000, “
“ 13, 3900, “
“ 14, 2700, “
“ 15, 2500, “
“ 16, 3400, “
“ 17, 3300, “
“ 18, 2100, “
“ 19, 1900, “
423 November 20, 2100, coli present,
“ 21, 3000, “
“ 22, 2100, “
“ 23, 3600, coli absent,
“ 24, 2000, coli present,
“ 25, 3200, “
“ 26, 3300, “
“ 27, 2600, “
“ 28, sample lost,
“ 29, 2700, coli present,
“ 30, sample lost,

That is the end of the outlet screen chamber, Bissell's point.

MR. JEFFRIES: Now the samples taken at the tap in the city chemist's office.

A. Yes sir. 1141, Market street. It was the bacteriological laboratory at the city chemist's office. The water was allowed to run five minutes before the sample was taken. The sample was then taken in a steriled flask and plated immediately.

Q. Now what was the result of those experiments?

A. Tap at the city chemist's office, 1141 Market street, September 17.

MR HAMLIN: Your table shows the year above there, doesn't it?

424 A. Yes sir, 1901.

MR. JEFFRIES: All of these tests and samples that were taken and made during the third period, the period that we have been dealing with today, were taken in 1901?

A. Yes sir, September, October and November.

Q. We went over that yesterday.

MR. SPRINGER: Yes, that is all in the record.

MR. JEFFRIES: Now go ahead with your results.

A. September 17, 1895, coli bacillus present.
September 18, 170, coli absent,
" 19, 170, "
" 20, 210, coli present,
" 21, 210, "
" 22, 120, "
" 23, 500, "
" 24, plate lost, coli present,
" 25, 600, coli present,
" 26, 275, "
" 27, 700, "
" 28, 275, "
" 29, sample lost; coli present,
" 30, 275, coli present.
October 1, sample lost; coli present,
" 2, 650, coli test not made,
425 October 3, 375, coli absent,
" 4, 525, "
" 5, 885, coli present,
" 6, 185, "
" 7, 970, "
" 8, 1500, "
" 9, 900, "
" 10, 360, "
" 11, 600, "

	“	20,	3400,	“

November 21, 2500, coli present,
427 November 22, 3700, coli present,
" 23, 4500, coli absent,
" 25, 2800, coli test not made,
" 26, 2300, coli present,
" 27, 1700, "
" 28, sample lost,
" 29, 2800, coli present,
" 30, 3300, "

MR. JEFFRIES: Now, an examination of the water was made during this period at the tap at 5946 Garfield avenue?

A. Yes sir.

Q. That was in a private residence, was it?

A. Yes, that was in the residence of one of our bacteriologists, Mr. Snodgrass. He lived far west on Garfield avenue, and the water supplied to him came from the Compton Hill stand pipe or from the high water service at Baden.

Q. How far from that?

A. It is about 4 miles directly across there, but you see it first comes to the stand pipe and goes back to him, so it must have traveled six miles to the stand pipe and received its pressure there, and then was carried out to this district.

Q. That is, it traveled six miles before it went to the standpipe?

A. Yes sir.

428 Q. And from that standpipe it was carried out to his residence?

A. Yes, sir.

Q. How far is this residence from the standpipe?

A. Four miles.

Q. That would be about eight miles?

A. Oh, it would be more than that; it would be pretty nearly ten miles to get to him. It goes right straight across from Baden in through the cemetery to Grand avenue. Now he lives west of Grand avenue, 5900.

Q. That would be about ten miles, would it?

A. That the water would have to travel to go from Baden to the standpipe and back to him.

Q. Ten miles from Baden?

A. Yes, sir.

Q. Now then how far from Baden to the reservoir?

A. No, about six miles from the reservoir to Baden and about four miles from Baden to the Garfield avenue house. You see it goes straight across the town to this standpipe and this standpipe supplies this region right across here.

Q. Now after these samples were got at the tap, 5946 Garfield avenue, the bacteriologist brought them down to the laboratory immediately.

429 A. Yes, he brought the samples directly to the laboratory and there it was plated.

Q. Well now, give us the result of that examination.

A. Beginning October 3, 1901, we took samples from this residence at 5946 Garfield avenue.

	October	3,	225,	coli test not made.
	"	4,	450,	coli present,
	"	5,	225,	"
	"	6,	485,	"

	"	26,	275,	coli test not made,

October 27, 230, coli present,
" 28, 450, "
" 29, 675, "
" 30, 300, "
" 31, 550, "

Q. Now for November.

A. November 1, 1300, coli present,
" 2, plate lost; coli present.
" 3, 3300, coli present.
" 4, 5000, "
" 5, 900, "
" 6, 4400, coli test not made,
" 7, 1900, "
" 8, plate lost; coli present,
" 9, 3100, coli present,
" 10, 11,200, "
" 11, plate lost; coli present,
" 12, 2200, coli present,
" 13, 2300, "
" 14, 2300, "
" 15, 2100, "
431 November 16, 6800, coli present,
" 17, 2200, "
" 18, 2200, coli absent,
" 19, 2000, coli present,
" 20, 2000, coli present,
" 21, 2300, "

No sample taken until the 25th.
November 25, 500, coli present,
Next sample taken on 27th, 700, coli absent,
None on 28th.
November 29, 1900, coli present,
" 30, 975, "

Q. Now can you give us the percentages?

A. Of coli at each one of these places?

Q. Yes, give us the percentages of coli in these examinations.

A. One mile above Alton, Illinois, coli for October, 1901, 100 per cent.

MR. SPRINGER: What is this? Number of coli in each sample?

A. Yes sir, the percentage. It was found in 100 per cent in October.

In November, 1901, in 77 per cent. making an average of 88.6 per cent. of samples collected.

For the third period percentage of colon baccillus at Hart-
432 ford for October, 1901, was 86.4 per cent.

For November, 56 per cent.

The average of this was 70 per cent.

Hartford, it is understood, is seven miles below Alton.

MR. JEFFRIES: Now get Bellefontaine.

A. During the third period the percentage of coli baccillus, at Ft. Bellefontaine, in the Missouri river, October, 1901, in 92.6 per cent.

In November, 1901, 80 per cent. of the times.

The average of this is 86.2 per cent.

During the third period the bacillus coli communis was found on the Missouri shore, Chain of Rocks, in September 76.9 per cent. In October, 97 per cent. In November, 84.6 per cent. The average for this period is 88.4 per cent.

Chain of Rocks, Illinois shore, the percentage of coli bacillus for September, 1901, was 76.9 per cent. October, 97 per cent. November, 77 per cent. of the time. The average is 81.7 per cent.

Coli bacillus, Mississippi river intake tower, Chain of Rocks, September, 1901, 76.9 per cent. October, 90 per cent. November, 77 per cent. Average, 80 per cent.

Q. That is the average for the three months?

A. The average for the three months, yes sir.
433 The reservoir, Chain of Rocks—

MR. SPRINGER: That is after sedimentation?

A. Yes sir, that is after sedimentation. Colon bacillus, September, 1901, 83.5 per cent. October—There is something wrong in this typewritten copy here, and I will have to go over the results. Will you leave that out for the present, the reservoir at the Chain of Rocks? There is some mistake of some kind for October. I will go over those calculations tonight.

We have the outlet settling basins, Bissell's Point for September, 86.4 per cent. October 94.04 per cent. November, 93.8 per cent. The average of those is 91.41 per cent.

The tap at 1141 Market street, September, 85.7 per cent. October, 97 per cent. November, 80, per cent. The average of this is 87.5 per cent of the samples collected at 1141 Market street.

MR. JEFFRIES: Now those collected at 1141 Market street are those referred to as the city hall collections?

A. Yes sir, at the city chemist's office.

MR. SPRINGER: Have you Garfield avenue?

A. Garfield avenue I have not calculated. I can give you those averages if you wish them.

MR. SPRINGER: You mean at the reservoir?

A. Yes sir, average of bacteria at the Chain of Rocks in-
434 take for the month of September, is 2,686, 14 days. I am
giving you the average of the bacteria for 14 days.

MR. SPRINGER: Oh yes.

A. The average of bacteria for the 14 days of September here is 2,686 at the Chain of Rocks.

MR. JEFFRIES: Now this does not have reference to the bacilli coli communis at all?

A. No sir, not at all. I take the number of bacteria each day and divide it by 14, which gives you this number, 2,686, the whole number divided by 14. That was at the outside of the intake in the river.

Q. Now then give it for the Illinois shore.

A. No, we are not going over to the Illinois shore at all. Now the outlet screen chamber settling basins, Chain of Rocks, after passing through the reservoir, 1375 is the average, 14 days, after settling 70 hours, or the percentage removal of bacteria is 48.43 per cent. The average for 14 days at Bissell's Point, outlet of the basins, the number of bacteria is 363, or the percentage of bacterial removal to this point after passing through both reservoirs, is 86.05 per cent.

Q. Now that doesn't mean the loss of bacteria from the reservoir?

A. In the one reservoir, and before they go out of another;
that means 86.05 per cent. have been removed to the out-
435 let chamber of the second reservoir.

Q. From the river?

A. From the river, yes, from the intake. Now then, the removal to the tap, 300— The number of bacteria per cubic centimeter, average 14 days, is 300. The percentage of removal is 88.83.

October, the average number of bacteria for the whole month is 20,500, at the intake in the river. The average number for the month of October in the outlet screen chamber in the settling basins at the Chain of Rocks is 2975. The percentage removal for this month is 85.6.

Bissell's point, outlet of the basins, the number of bacteria averaged for the month, 1,137. Percentage removal, 90 per cent.

Average number of bacteria for the month of October at the tap 1141 Market street is 843. Percentage removal, 95.9 per cent.

The average for the month at 5943 Garfield avenue, the tap, the average for the month is 412, or the percentage removal, 98 per cent.

Now then, for November, total number of bacteria found at the intake for the month of November, the average is 39,518.

The total of the outlet screen chamber, Chain of Rocks settling basins, for the month of November, is 7,600. That
436 is the average for the month. Percentage removal, 81.5.

Bissell's Point, outlet settling basins, average number of bacteria per month, 2,545. Percentage removal, 93.5 per cent.

Tap, 1141 Market street, the average is 2,560. Percentage removal is 93.2 per cent.

5946 Garfield avenue tap, the average number of bacteria for the month was 2,880.

MR. SPRINGER: More than the other place?

A. Yes.

MR. SPRINGER: How do you account for that?

A. I don't know how to account for it except that they were stirring things up in the pipes.

The percentage removal is 92.7, or I can give you the total percentage lost for those three months. The total percentage lost for these three months, 14 days in September, all of October and all of November, at the outlet of the seven settling basins, and the outlet screen chamber Chain of Rocks, 71.84 per cent.

Bissell's Point, outlet settling basins, 90 per cent.

Tap, 1141 Market street, 92.64 per cent.

Tap, Garfield avenue, 95. 3 per cent.

Adjourned until 10 o'clock, Saturday morning, February 21, 1903.

437 Met pursuant to adjournment at the Southern Hotel at ten o'clock a. m., Saturday February 21, 1903.

Present, the Commissioner and the same Counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD, resumed the stand for further direct examination by Mr. Jeffries.

Q. Now, doctor, you may give the percentage of bacteria found at the different places on the Illinois river.

A. The Illinois river and the Mississippi river at Grafton for this third period. Now the average number of bacteria per cubic centimeter for the month of October, 1901, Mississippi river above Grafton, is 717.

The average number of bacteria per cubic centimeter, Mississippi river above Grafton for the month of November, 2,290.

The average number for the Illinois river above Grafton, Illinois for the month of October, 1,780, and for the month of November, 3,050. I am not giving the averages for the three months, but for each month. It is easier. You see the Illinois contains quite the larger number there.

JUDGE SPRINGER: Did you give Peoria, above Peoria?

A. Didn't I give you that?

Q. No sir.

438 A. I have not the totals for Peoria for that period.

Q. You didn't give it at Bellefontaine, either.

A. Well, I want to make a comparison between Bellefontaine and Hartford later on. I will make a comparison between Bellefontaine and Hartford and then we will get at the results. I think I have got that. Later along when we again come to Peoria, coming down the river, I think I have got averages for the three months.

MR. JEFFRIES: Now give us the result of the cultural and bacterial features of the bacteria found in the Illinois river, the Mississippi river, the Missouri river, Lake Michigan and the canal—that is the Chicago Drainage canal during the second period from January to October, 1900.

A. Now this is a chart original with this laboratory, presenting the morphological cultural and biochemical features of the micro-organism found in the waters of Lake Michigan, the Chicago Drainage canal, the Illinois river and the Mississippi river, at the intake. I will read the name of the organism, but how to present that chart I don't know.

JUDGE SPRINGER: I think the stenographer should take that chart and copy it into the record.

MR. JEFFRIES:—Just wait until I examine him about it. I asked you a few minutes ago, doctor, if you could give the cultural and bacterial features of the waters of the various 439 rivers in question and the lake, and the Chicago Drainage canal. I would like to have you state fully and clearly the cultural and bacterial features as found upon an examination of the waters.

JUDGE SPRINGER: Give us a general explanation about this first.

MR. JEFFRIES: That question can come next. I want to get this into the record first. First give the name of the organism, then the properties.

A. The bacteria here are classified into types according to the colors which they produce upon the media, or certain other characteristics by which they can be confined to groups, distinctive groups, and the morphological, cultural and biochemical features which carry it through a variety of media.

Now shall I begin and go right through with this thing?

Q. Go right through with it.

A. We have under the fluorescens type, first, the bacillus fluorescens incognitis. The first investigator was Wright.

ATTORNEY-GENERAL CROW: What does that mean—the first investigator?

A. It means that he discovered it or found it in the water.

Q. I understand what it means, but I want to get it into the record.

A. Yes sir. It is a bacillus, motile, does not form spores. 440 Under cultural features now: In nutrient broth it produces a scum and the nutrient broth is made turbid by it. In an agar tube it shows a wrinkled membrane.

Gelatine plate colony characteristics not distinct.

Potato, a luxuriant and visible growth.

Fermentation tube does not produce gas.

Grows best at body temperature.

In gelatine it does not liquify.

In milk it does not coagulate.

It does not liquify blood serum.

It does not ferment.

It produces no gas.

Does not reduce nitrates.

Does not produce indol.

Again it does not coagulate milk.

Is chromo-genic on nutrient agar, and it produces fluorescens of the media.

MR. JEFFRIES: I notice you said a moment ago that it is a particular branch or type?

A. The fluorescent type.

Q. It grows at body temperature?

A. Yes. Well, that is a temperature, 98 3/5 F. or 36½ centigrade.

Q. What you mean by that is that it developed?

A. It grows best.

441 Q. The vitality is active?

A. It grows best on our nutrient media, more vigorous in a definite period of time.

Q. Now the second type.

A. The second type or the next one following do you mean?

Q. Yes.

A. Number 2, bacillus fluorescens liquefaciens. First investigator Fluegge.

Diameter greater than one M, that is one micro-millimeter. It is less than one micro-millimeter.

It is motile.

Does not form spores or scum and the nutrient broth turbid.

Growth on nutrient agar tube not dull, not wrinkled.

On gelatine plate, appearance characteristic.

Body tube, growth visible, not abundant or not luxuriant.

Does not grow in closed arm of fermentation tube.

Does not grow well at body temperature.

It is not facultative an-aerobic.

Q. State what you mean by facultative an-aerobic.

A. We have two words in bacteriology, aerobic and an-aerobic. Aerobic bacteria grow best in the presence of oxygen. The an-aerobic bacteria grow best in its absence.

Now there are classes of micro-organism that grow under
442 both conditions. They grow nearly as well under an-aerobic conditions as they do under aerobic conditions. Since they have this faculty of doing this thing they are called facultative an-aerobic or facultative aerobic, depending upon which condition they grow best.

It liquifies gelatine.

Produces and liquifies blood.

Liquifies casein in milk.

Produces no gas in Dextrose broth.

Reduces nitrates,

Does not produce indol,

Coagulates milk,

Q. What do you mean by indol?

A. Indol is one of the products, one of the putrefactive products the result of destructive decomposition or the destructive action of bacteria upon organic matter.

Q. Then that particular branch of that type does not produce destruction of solid matter?

A. It does not produce indol. Yes, it produces the destruction of the solid matter without the production of indol. That is all for that.

Q. Now let us have the following one.

443 A. The third one is bacillus pyocyaneus.

Lesage is the first investigator.

Morphology bacillus,

Diameter less than 1 M, micro-millimeter,

It is motile and does not produce spores,

On nutrient broth produces a scum, broth turbid,

Nutrient agar tube, growth not dull and not wrinkled,

On gelatine plate it has a characteristic appearance,
Body tube, growth visible and luxuriant,
Fermentation tube grows in the closed arm,
Grows well at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Gas production in Dextrose broth,
Nitrates reduced,
No indol produced,
Coagulates milk,
Not chromo-genesis, fluorescent.

444 Number 4, bacillus fluorescens tenuis.
First investigator is Zimmerman.
It is a bacillus in diameter less than one M,
It is motile and forms spores,
Nutrient broth scum,
Nutrient broth is turbid,
Nutrient agar tube growth,
Not dull, not wrinkled,
Gelatine plate's appearance characteristic,
Body tube growth visible and luxuriant,
Fermentation tube, grows in the closed arm,
Grows at body temperature,
Facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Nitrates reduced,
Produces indol,
Does not coagulate milk,
Fluorescent.

445 No. 5. Bacillus fluorescens termo.
Discovered by Mace,
Diameter less than one M,
Motile and does not form spores,
Produces a scum,

Medium turbid in nutrient broth,
Nutrient agar tube growth not dull and not wrinkled,
Gelatine plate appearance not characteristic,
Body tube visible growth, luxuriant growth,
Fermentation tube, does not grow in the closed arm,
Does not grow at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Does not liquify blood serum,
Nitrates reduced,
Indol not produced,
Milk not coagulated,
Fluorescent,
Non-chromo-genic.

446 Number 6, bacillus viridis.
Discovered by Lesage,
Diameter less than one M,
Motile and does not form spores,
Produces scum and turbidity in nutrient broth,
No characteristic growth,
Nutrient agar not dull and not wrinkled,
Gelatine plate growth characteristic,
Body tube, visible and luxuriant,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Indol production,
Milk coagulated.
Not chromo-genic,
Fluorescent.

447 Number 7, chromo genic, type red,
Bacillus rubefaciens,

Discovered by Zimmerman,
It is a bacillus with a diameter less than one M,
Motile and does not form spores,
On broth we have a scum,
No turbidity, growth,
Growth on nutrient agar tube not dull, not wrinkled,
Gelatine plate, characteristic appearance,
On body visible growth, not luxuriant,
Does not grow in closed arm of fermentation tube,
Grows well at body temperature,
Not facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrate,
No indol production,
Milk not coagulated,
Chromo genic,
Produces a pink color,
Not fluorescent.

448 Number 8, type chromo-genic, orange,
Bacillus arborescens,
First discoverer Franklin,
Bacillus less than one M in diameter,
Motile and does not form spores,
Does not produce scum, but growth has turbidity in nutrient broth.
Nutrient agar tube growth not dull, not wrinkled,
Gelatine plate appearance characteristic,
Body tube visible and luxriant growth,
Grows in the closed arm of fermentation tube,
Does not grow at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas,

Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
Chromo genesis,
Fluorescence.
449 Number 9, bacillus aurescens,
Discovered by Ravenel,
It is a bacillus, diameter less than one M,
Motile and does not form spores,
Nutrient broth, no scum,
Broth turbid,
Nutrient agar tube, growth not dull, not wrinkled,
Body tube growth visible and luxuriant,
Gelatine plate appearance not characteristic,
Fermentation tube, does not grow in closed arm,
Grows at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
No indol production,
Coagulates milk,
Chromo genesis, orange,
Not fluorescent.
No. 10. Bacillus fulvus,
450 Discovered by Zimmerman,
Bacillus diameter less than one M,
Non-motile and does not form spores,
Nutrient broth, no scum,
Growth, turbidity,
Nutrient agar tube not dull, growth wrinkled,
Appearance characteristic on gelatine plate,
Body tube growth, visible, not luxuriant,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,

Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
Chromo-genesis, orange,
Not fluorescent.
Number 11, Bacillus nubilis.
451 Discovered by Frankland,
It is a bacillus in diameter less than one M,
Motile,
Does not form spores,
Produces scum in nutrient broth,
Broth turbid,
Nutrient agar tube growth not dull, not wrinkled,
Appearance not characteristic on gelatine plate,
Growth on body tube visible, not luxuriant,
Grows in the closed arm of fermentation tube,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Nitrates reduced,
Indol not produced,
Coagulates milk,
Chromo-genesis, orange,
Number 12. Bacillus plicatus,
452 Discovered by Zimmerman,
Bacillus in diameter less than one M,
Motile and does not form spores,
Does not produce scum,
Does not produce turbid growth,
Nutrient agar tube not dull, growth wrinkled,
On gelatine plate appearance not characteristic,

Body tube growth visible, not luxuriant,
Does not grow in closed arm of fermentation tube,
Grows at body temperature,
Not facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produe indol,
Does not coagulate milk,
Chromo genesis, orange,
Not fluorescent.

Number 13. Bacillus aureus,
453 Discovered by Adametz,

It is a bacillus less than one M in diameter,
Motile and does not form spores,
Nutrient broth turbid,
No scum,
Nutrient agar tube not wrinkled, not dull,
Gelatine plate appearance not characteristic,
Body tube, luxuriant and visible growth,
Fermentation tube, grows in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
Chromo genesis, yellow.

Number 14. Micrococcus cremoides,
454 First investigator, Zimmerman,

It is a micrococus, diameter greater than one M,
Not motile,
No spore production,

Nutrient broth turbid,
No scum,
Growth on nutrient agar tube not dull, not wrinkled,
Gelatine plate, appearance not characteristic,
Body tube, growth visible and luxuriant,
Does not grow in closed arm of fermentation tube,
Grows at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Produces gas in Dextrose broth,
Reduces nitrates,
Produces indol,
Does not coagulate milk,
Chromo genesis, faint yellow.

Number 15. Bacillus desidiosus,
455 Discovered by Wright,
Bacillus less than one M in diameter,
Not motile,
Does not form spores,
Produces turbidity,
No scum, in nutrient broth,
Growth not dull, not wrinkled on nutrient agar,
Gelatine plate appearance not characteristic,
Body tube, growth visible and luxuriant,
Does not grow in closed arm of fermentation tube,
Does not grow at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
Chromo genesis yellow.

Number 16. Micrococcus flavus liquefaciens,
456 Discovered by Fluegge,
In diameter less than one M,
Non-motile,
Does not form spores,
Grown in nutrient broth turbid,
No scum,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate appearance not characteristic,
Body tube, visible not luxuriant growth,
Does not grow in closed arm of fermentation tube,
Is not facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Liquifies blood serum,
Does not produe gas in Dextrose broth,
Reduces nitrates,
Does not produce indol,
Does not coagulate milk,
Chromo genesis, yellow.

Number 17. Bacillus helvolus,
457 Discovered by Zimmerman,
It is a bacillus in diameter less than one M,
It is motile,
Does not form spores,
No scum,
Broth turbid,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate appearance not characteristic,
Body tube, visible, not luxuriant,
Fermentation tube, grows in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Nitrates reduced,

Indol produced,
Does not coagulate milk,
Chromo genesis, yellow,
Number 18. Bacillus iridescens,
458 Discovered by Tataroff,
It is a bacillus in diameter greater than one M,
Non-motile,
Produces spores,
Nutrient broth scum turbid,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate appearance characteristic,
Body tube growth visible, not luxuriant,
Fermentation tube, no growth in closed arm,
Grows at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
Chromo genesis, yellow.
Number 19. Bacillus lactis erythrogenes,
459 Discovered by Hueppe,
It is a bacillus in diameter less than one M,
Non-motile,
Does not produce spores,
Nutrient broth scum,
Turbidity,
Nutrient agar tube not dull, wrinkled,
Gelatine plate appearance characteristic,
Body tube growth visible and luxuriant,
Fermentation tube no growth in closed arm,
No growth at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,

Liquifies blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Does not produce indol,
Coagulates milk,
Chromo genesis, yellow pink,
Number 20. Bacillus Ocraceus,
460 Discovered by Zimmerman,
It is a bacillus with diameter greater than one M.
It is motile,
Forms spores,
Nutrient broth produces scum and turbidity,
Nutrient agar tube, not dull not wrinkled,
Gelatine plate appearance not characteristic,
Body tube visible, not luxuriant,
Fermentation tube, no growth in closed arm,
Grows at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
No gas produced in Dextrose broth,
Nitrates reduced,
Indol not produced,
Coagulates milk,
Chromo genesis, yellow.
Number 21. Bacillus sub flavus,
461 Discovered by Zimmerman,
Bacillus diameter less than one M,
Motile,
Does not produce spores,
Produces scum turbidity in nutrient broth,
Nutrient agar tube not dull, not wrinkled,
Appearance on gelatine plate not characteristic,
Body tube, visible, not luxuriant,
Fermentation tube, no growth in closed arm,
Growth at body temperature,
Not facultative, an-aerobic,

Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
No indol produced,
Does not coagulate milk,
Chromo genesis, yellow,
Number 22. Sarcina lutea,
462 Discovered by Schroeter,
Not a bacillus, in diameter less than one M
Not motile,
Does not form spores,
Nutrient broth, no scum or turbidity,
Nutrient agar tube, not dull, not wrinkled,
Gelatine plate growth characteristic,
Body growth, visible and luxuriant,
Growth in closed arm of fermentation tube,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
Chromo genesis, yellow.
Number 23. Proteus type,
463 Bacillus mesentericus vulgatus,
Discovered by Eisenberg,
Bacillus, diameter larger than one M,
Motile,
Forms spores,
Nutrient broth, scum and turbid,
Nutrient agar not dull, wrinkled,
Gelatine plate appearance characteristic,
Body tube, visible and luxuriant growth,

Growth in closed arm of fermentation tube,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Produces indol,
Coagulates milk,
No chromo genesis.

Number 24. Bacillus Proteus mirabilis,
464 Discovered by Hauser,
Bacillus diameter less than one M,
Motile,
Does not form spores,
Nutrient broth scum turbid,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate, growth not characteristic,
Body tube, visible and not luxuriant
Fermentation tube growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
No chromo genesis.

Number 25. Proteus zenkeri,
465 Discovered by Hauser,
Bacillus, diameter less than one M,
Motile,
No spores produced,
Nutrient broth scum, but not turbid,
Nutrient agar tube, not dull but wrinkled,

Gelatine plate growth characteristic,
Body tube growth visible and luxuriant,
Fermentation tube, grows in closed arm,
Grows at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrate,
Does not produce indol,
Coagulates milk,
Not chromogenic.

Number 26. Bacillus subtilis-cereus,
466 Discovered by Frankland,
It is a bacillus in diameter greater than one M,
Motile,
Produces spores,
Nutrient broth produces scum,
Not turbid,
Nutrient agar tube dull but wrinkled,
On gelatine plate appearance characteristic,
Body tube visible and luxuriant growth,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Does not produce indol,
Coagulates milk,
Non-chromogenic,

Number 27. Bacillus subtilis,
467 Discovered by Ehrenberg,
Bacillus, diameter greater than one M,
Motile,

Produces spores,
Nutrient broth turbid and scum,
Nutrient agar tube growth, dull and wrinkled,
Gelatine plate growth characteristic,
Body tube visible and luxuriant growth,
Grows in the closed arm of fermentation tube,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
No chromo genesis.

Number 28. Type cloacae,
468 Discovered by Jordan,
Diameter less than one M,
Motile,
Does not produce spores,
Nutrient broth, scum and turbid,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate not characteristic,
Body tube, visible, luxuriant,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Liquifies casein,
Liquifies blood serum,
Produces gas in Dextrose broth,
Reduces nitrates,
Produces indol,
Coagulates milk,
Non-chromogenic.

Number 29. Bacillus delicatulus,
469 Discovered by Jordan,

Diameter greater than one M,
Motile,
Does not produce spores,
Nutrient broth turbid but no scum,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate, appearance not characteristic,
Body tube, visible but not luxuriant growth,
Grows in the closed arm of fermentation tube,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
" casein,
" blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Produces indol,
Coagulates milk,
No chromo genesis.

Number 30. Bacillus Hyalinus,
470 Discovered by Jordan,
Diameter greater than one M,
Non-motile,
Does not produce spores,
Nutrient broth, no scum, but turbid,
Nutrient agar tube, not dull but wrinkled,
Gelatine plate appearance not characteristic,
Body tube luxuriant and visible growth,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Liquifies blood serum,
Produces gas in Dextrose broth,
Reduces nitrates,
Produces indol,
Coagulates milk,
No chromo genesis,

Number 31. Bacillus liquefaciens,
471 Discovered by Eisenberg,
Bacillus diameter less than one M,
Non-motile,
No spore production,
No scum, turbid growth,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate appearance not characteristic,
Body tube luxuriant and visible growth,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Produces gas in Dextrose broth,
Reduces nitrates,
Does not produce indol,
Coagulates milk,
Non-chromogenic.

Number 32. Type liquidus,
472 Bacillus antenni formis,
Discovered by Ravenel,
Morphology bacillus,
Diameter less than one M,
Motile,
Does not produce spores,
Does not produce scum on nutrient broth,
No turbidity,
Nutrient agar tube, not dull, not wrinkled,
Gelatine plate not characteristic,
Body tube, growth visible and luxuriant,
Fermentation tube, growth in closed arm,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Liquifies blood serum,
Produces no gas in Dextrose broth,

Nitrates reduced,
Indol produced,
Coagulates milk,
Non-chromogenic.
Number 33. Bacillus liquidus,
473 Discovered by Frankland,
In diameter less than one M,
Motile,
Does not produce spores,
Nutrient broth produces scum and turbidity,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate appearance not characteristic,
Body tube growth visible and luxuriant,
Growth in closed arm of fermentation tube,
Does not grow at body temperature,
Facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
Non-chromo-genesis.
Number 34. Type superficialis,
474 Bacillus megaterium,
Discovered by DeBarry,
Morphology bacillus,
Diameter greater than one M,
Motile,
Produces spores,
Nutrient broth produces scum and turbidity,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate growth not characteristic,
Body tube not visible, not luxuriant
Fermentation tube, no growth in closed arm,
Growth at body temperature,
Not facultative an-aerobic,

Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
No chromo genesis.

Number 35. Bacillus superficialis,
475 Discovered by Jordan,
Diameter less than one M,
Motile,
Does not form spores,
Nutrient broth produces scum and turbidity,
Nutrient agar tube, not dull, not wrinkled,
Gelatine plate not characteristic,
Body tube, visible and luxuriant growth,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Not facultative an-aerobic,
Liquifies gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Nitrates not reduced,
Does not produce indol,
Does not coagulate milk,
No chromo-genesis.

Number 36. Coli type,
476 Bacillus coli communis,
Discovered by Escherich,
Bacillus diameter less than one M,
Motile,
Does not form spores,
Produces turbidity in nutrient broth, but no scum,
Nutrient agar tube, growth not dull, not wrinkled,
Gelatine plate appearance not characteristic,
Body tube growth, visible and luxuriant,

Fermentation tube grows in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Produces gas in Dextrose broth,
Reduces nitrates,
Produces indol,
Coagulates milk,
Non-chromogenic.

Number 37. Bacillus aquitilis sulcatus No. 1,
477 Discovered by Weichselbaum,
Diameter less than one M,
Motile,
Does not form spores,
Nutrient broth turbid, no scum,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate not characteristic,
Body growth visible and luxuriant,
Fermentation tube, growth in closed arm,
Grows at body temperature,
Facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not produce indol,
Does not reduce nitrates,
Coagulates milk,
Non-chromo-genic.

Number 38. Bacillus aquitilis sulcatus No. 3,
478 Discovered by Weichselbaum,
Bacillus diameter less than one M,
Motile,
Produces spores,
Nutrient broth is turbid, no scum,
Nutrient agar tube not dull, not wrinkled,

Gelatine plate not characteristic,
Growth visible and luxuriant on body,
Growth in closed arm of fermentation tube,
Growth at body temperature,
Facultative, an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
Non-chromo genesis.

Number 39. Bacillus aquatilis sulcatus No. V,
479 Discovered by Weicheselbaum,

Bacillus diameter less than one M,
Motile,
Does not form spores,
Produces turbidity, but no scum,
In nutrient agar tube, not dull, not wrinkled,
Gelatine plate not characteristic,
Growth on body not visible, not luxuriant,
Growth in the closed arm of fermentation tube,
Does not grow at body temperature,
Facultative an-aerobic,
Does not liqify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
Non-chromo genic.

Number 40. Bacillus stellatus,
480 Discovered by Zimmerman,

Bacillus, diameter less than one M,
Motile,
Does not produce spores.

Nutrient broth turbid,
Scum,
Nutrient agar tube growth not dull, not wrinkled,
Gelatine plate not characteristic,
Body tube visible and luxuriant growth,
No growth in closed arm of fermentation tube,
Grows at body temperature,
Not facultative, an-aerobic,
Does not liquify gelatine or casein,
Does not liquify blood serum,
Does not produce gas in Dextrose borth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
Non-chromo-genic.

Number 41. Type candicans,
481 Bacillus albus,
Discovered by Eisenberg,
In diameter less than one M,
Motile,
Does not form spores,
Turbidity but no scum in nutrient broth,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate not characteristic,
Body tube, visible and luxuriant growth,
Fermentation tube, growth in closed arm,
Does not grow at body temperature,
Facultative, an-aerobic,
Does not liquify gelatine,
Does not liquify blood serum,
Does not liquify casein,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Does not produce indol,
Does not coagulate milk,
Non-chromo-genic.

Number 42. Bacillus bruneus,
482 Discovered by Adametz,

Morphology bacillus,
In diameter less than one M,
Non-motile,
Produces spores,
Nutrient broth turbid, no scum,
Nutrient agar tube not dull, not wrinkled,
Gelatine plate appearance not characteristic,
Body tube, visible and luxuriant growth,
Fermentation tube, growth in closed arm,
No growth at body temperature,
Not facultative an-aerobic,
Does not liquify gelatine,
" casein,
" blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Does not coagulate milk,
Non-chromo-genic.

Number 48. Bacillus candicans,
488 Discovered by Frankland,
In diameter less than one M,
Motile,
Does not produce spores,
Nutrient broth turbid, no scum,
Nutrient agar tube growth not dull, not wrinkled,
Gelatine plate not characteristic,
On body visible growth not luxuriant,
In fermentation tube, no growth in closed arm,
Does not grow at body temperature,
Not facultative an-aerobic,
Does not liquify gelatine,
Does not liquify casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,

Non-chromo-genic.

Number 44. Bacillus lactiviscossus,

484 Discovered by Adametz,

In diameter greater than one M,

Motile,

Does not produce spores,

In nutrient broth turbidity, no scum,

Nutrient agar, not dull, not wrinkled,

Gelatine plate not characteristic,

Body tube, visible and luxuriant growth,

Fermentation tube,no growth in closed arm,

No growth at body temperature,

Not facultative, an-aerobic,

Does not liquify gelatine,

Does not liquify casein,

Does not liquify blood serum,

Does not produce gas in Dextrose broth,

Does not reduce nitrates,

Does not produce indol,

Does not coagulate milk,

Non chromo-genic.

Number 45. Bacillus ubiquitus,

485 Discovered by Jordan,

In diameter greater than one M,

Motile,

Produces spores,

Produces turbidity and scum in nutrient broth,

Nutrient agar tube, not dull, not wrinkled,

Gelatine plate not characteristic,

Body tube, visible but not luxuriant growth,

Fermentation tube, no growth in closed arm,

Grows at body temperature,

Facultative an-aerobic,

Does not liquify gelatine,

Does not liquify casein,

Does not liquify blood serum,

Does not produce gas in Dextrose broth,

Reduces nitrates,
Does not produce indol,
Coagulates milk,
No chromo genesis.
Number 46. Urea type,
486 Bacillus urea,
Discovered by Zaksch,
Morphology type of bacillus,
Diameter less than one M,
Motile,
Does not produce spores,
Nutrient broth turbid and scum,
Nutrient agar tube, not dull, not wrinkled,
Gelatine plate not characteristic,
Body growth visible and luxuriant,
Fermentation tube, growth in the closed arm,
Grows at body temperature,
Facultative an-aerobic,
Does not liquify gelatine,
" casein,
" blood serum,
Does not produce gas in Dextrose broth,
Reduces nitrates,
Does not produce indol,
Herring brine odor,
Non-chromo genesis.
Number 47. Type sarcina. alba,
487 Discovered by Maschek,
Not a bacillus,
Diameter greater than one M,
Non-motile,
Does not form spores,
No scum or broth turbidity,
In agar tube, growth not dull, not wrinkled,
Gelatine plate not characteristic,
Body tube visible and luxuriant growth,
Fermentation tube, no growth in closed arm,
Grows at body temperature,

Not facultative an-aerobic,
Liquifies gelatine,
" casein,
Does not liquify blood serum,
Does not produce gas in Dextrose broth,
Does not reduce nitrates,
Does not produce indol,
Coagulates milk,
Non-chromo-genic.

ADJOURNED until 2:15 P. M., same day, February 21, 1903.

488 2:15 p. m., Saturday, February 21, 1903. Continuation pursuant to adjournment. Present, the Commissioner and counsel same as before.

DR. AMAND N. RAVOLD,

Direct Examination (continued), by Mr. Crow.

Q. Doctor, we were to put in the record here an explanation of these terms—now those terms that are technical there, that need explanation in connection with that table—please give the sense and the definition of each one of them?

A. The stenographers will make a copy of this exhibit, will they?

Q. Well, we will do that in the course of time, but not at this state of the record.

THE COMMISSIONER: It has not yet been offered, has it?

MR. CROW: Oh no, it has not been offered.

THE COMMISSIONER: Because I want to have it marked for identification when it is offered.

THE WITNESS: Under the head of morphology, we have here the question of the form of the micro-organisms—bacillus, meaning a rod, and it is marked either positive or negative. If it is a bacillus, it is marked with a cross, positive; if in any form other than bacillus, it is marked negative, with a minus sign. 489

The next under morphology comes the diameter greater than 1 M. "M" stand for the Greek word micron, and micron is 1-1,000 of a millimeter, or 1-25,000 of an inch, so that a micro-organism here recorded will be larger or smaller than 1-25,000 of an inch, according to this chart.

Under the head of morphology comes motility. A micro-organism may be motile, that is, swim about, or it does not do so.

Under the form morphology comes the word spore. The word spore was explained in the early talk made on micro-organisms; it means that these micro-organisms contain within themselves bodies for the preservation of the species, so that the chart is marked positive and negative whether it be present or absent.

Now under cultural features are the growth characteristics, upon certain nutritive media which will be named as we approach them.

Nutritive broth—that is nutritive broth as will be described, in test tubes, and into it the micro-organism is sown. Now it grows in that medium or it does not grow. If it grows in the medium making a cloudy condition in the medium, that is recognized as turbidity. Then if the micro-organism grows out on the surface of the medium, forming a pellicle or membrane on it, it is called a scum, and is here so recorded, and if it is either one of these it is marked positive and if neither one negative.

490 Under cultural features comes nutrient agar-agar. That is a medium composed of agar-agar of a definite per cent. in nutrient broth. This material is a solid medium and is slanted in the tube as we speak about it, and on the surface of that medium is sown the micro-organism in pure culture. Now the micro-organism grows and whether it grows with a dull growth—it is practically not transparent or translucent—and if the growth be wrinkled, it is so recorded here. If it does neither one, it is marked negative. If it grows dull or wrinkled, it is so marked.

The third feature is growth in gelatin plate. The micro-organism in pure culture is plated as described, generally in a petri dish, and this allowed to grow at 20 centigrade—

MR. SPRINGER: What would that be in Fahrenheit?

A. About 60 degrees Fahrenheit. The growth that occurs here is called a colony, which is a growing out of the micro-organisms into numbers sufficiently large to be seen either with the unaided eye or with the microscope. The colony has certain characteristics, and these are marked as its appearance is characteristic, or as it is not characteristic.

On potato—that is a potato cut into cylinders and then cut cross-wise, so as to afford a slant surface, it making a surface upon which growth can be easily made. Upon the ster-
491 iled potato then, is sown the micro-organism and the micro-organism grows either with visible growth or with invisible growth, and the growth is luxuriant or not so.

Under cultural features we have fermentation tubes. Now the question is whether a micro-organism in this fermentation tube, which is a "U" tube, grows in the closed arm or not. The heating of medium in fermentation tubes drives the air out of it, so that the medium in this closed arm is practically free from air, consequently a strictly aerobic or a so-called obligatory aerobic will not grow in that arm, while one that is facultative, or has the faculty of growing in the absence of any oxygen, will grow.

Then we come to the biochemical features we have here recorded, growth at body temperature. Now the micro-organism is sown upon agar-agar as a rule, and kept at the incubated temperature of the body, that is 98 3-5 degrees Fahrenheit, or 36½ degrees centigrade, or it is kept at 20 degrees centigrade, which is the ordinary temperature of about 60 degrees Fahrenheit.

Now, at which of these temperatures it grows best is here recorded, so that if it grows at body temperature—if it grows at that temperature best—it is marked positive. If marked negative it does not grow that way best, while at that temperature. It does not mean that it does not grow at all, but that it does not grow so well as it does at the temperature below.
492 Facultative an-aerobic—I described that this morning, do you want to hear it again?

MR. CROW: No.

A. (Continuing) Affected by range of reaction. Now in making up these tables I did not record that fact. In giving the details of the growth of the different micro-organisms I left that out—I left out this affected by range of reaction.

MR. JEFFRIES: And that was omitted in your testimony this morning?

A. Yes. Range of reaction means whether it grows in the presence of an alkali, neutral or in the absence of an alkali or acid and in the presence of an acid. We have first, a medium alkaline to phenolphthalein 1.5 per cent.

A second medium neutral to phenol phthalein, and a third acid, 1.5 per cent. to phenol phthalein. Upon these three media the micro-organism is sown and the luxuriancy with which it grows indicates the reaction at which it grows best alkaline, acid or neutral.

Under biochemical we have liquification, and we have first liquification of gelatin. Some micro-organisms have the faculty of digesting gelatin and liquifying it, and this is so recorded. It either liquifies or it does not liquify. That is quite a cultural characteristic of these organisms—of most of these organisms. 493

The next feature is casin. The word "casin" is next used, which is the cheese of milk. Some micro-organisms have the faculty of growing in milk, precipitating the casin and reducing it to a liquid, others have not, so that is recorded.

Upon blood serum collected and sterilized in test tubes with the slanting surface the micro-organism is sown, and kept at room temperature for twelve days and if the micro-organism liquifies that blood serum, it turns it to a fluid, it is so recorded. If it does not do that, is is so recorded—positive or negative.

MR. JEFFRIES: What temperature did you say that was kept at?

A. Generally kept at the room temperature, twenty degrees centigrade.

Dextrose broth—that means a nutrient broth prepared as we will show, and with one per cent. of dextrose—sugar—added to it. Now that is put in a fermentation tube and the micro-organisms inoculated into it. If these micro-organisms break up the sugar so as to form a gas in the closed arm of the tube we speak of that as gas production, and it is marked positive. If it does not produce gas it is marked negative—if it does not produce gas in the presence of dextrose broth. In the reduction of nitrates—a nitrate broth is made up and in it the micro-organism is sown—nitrate broth I should say—and if it reduces the nitrates to nitrites why that is so recorded—positive or negative.

494 Under the bio-chemical feature next is indol production. It is the result of the destructive action of micro-organisms on organic matter. It produces a peculiar odor—a fetid odor, and whether it produces it or not, it is so recorded.

In milk sterilized in tubes, the micro-organism is shown. Now whether it coagulates the milk or not, it is so recorded—if it makes cheese. Then upon nutrient agar-agar slanted in a tube, the micro-organism is grown, and whether it produces a color upon the medium or not, that is whether the bacterium itself has a color within its cell walls. It is spoken of as chromogenesis, or pigment productive. Fleuorescent means that the toxines or whatever it may be which is produced by the micro-organism, colors the medium. The color does not remain within the micro-organism as in pigment production, but it gives off a material which colors the medium itself. Then we have fleuorescent coloration.

That is the description, sir.

Q. MR. JEFFRIES: Now, what you have testified to in reference to the bacterial qualities of this water in the forenoon, and this afternoon, is the result of practical experiments with the water under your supervision, is it not?

A. Yes sir.

495 MR. CROW: Just give the period of time.

A. Samples collected from January 23 to October 11, I think it is.

Q. MR. JEFFRIES: 1900?

A. 1900.

Q. Now, what system of rules did you use in those experiments, those tests?

A. Every micro-organism or colony upon a gelatine plate which seemed to be different from other micro-organisms, and was first, picked off and sown in agar-agar after the agar-agar culture was obtained, sown in broth and its form and motility recorded from that. You see the bacterium undergoes three different transfers from the gelatine plate to agar-agar, to get a good growth of it, and then into broth so as to get as nearly as possible constancy of form under these new conditions, and then here are recorded motility, size and form, and whether it contains spore or not, and from this culture, if pure all other cultural media was inoculated and recorded after a definite period of time. We were looking for constancy of form and optimum reaction, and then recorded the results in books kept for that purpose and afterwards charted out as here shown.

ADJOURNED until 10:00 a. m., Monday, February 23, 1903, same place.

496 Met pursuant to adjournment at the same place at ten
o'clock a. m., February 23, 1903.

Present, the Commissioner and the same counsel as before.

AMAND NICHOLAS RAVOLD

resumed the stand for further direct examination, by Mr. Jeffries, and testified as follows:

Q. Now, doctor, you may state what you mean by a microscopical examination of water, from a scientific standpoint?

A. Well, in the sanitary examination of water there are several procedures: first, the physical aspect of the water, that is, testing its temperature, its color, its turbidity, its sediment, its odor, hot and cold, that is the physical appearance. Then we have the chemical examination for the organic and inorganic constituents in the solution, and then the microscopical examination for the lower and higher forms of animal and vegetable life. Under the microscopical examination we have two kinds of examinations that will here be presented, first, the larger forms, what is known as the floating matter in the water, the animal and vegetable life, and known as plankton from planktos, the Greek, meaning wandering. Then we have the so-called
bacteriological examination of the water which is an ex-
497 amination of the lower forms of vegetable life. Do you
want an historical sketch of that?

Q. Yes.

A. As soon as the microscope was developed sufficiently to see these lower forms of animal and vegetable life in water a number of observers began studying and recording the forms seen. And we date back now to 1675 again with von Leeuwen-

hork, and from that time until 1850 records were made, but the significance of the micro-organisms in water was not noted until Dr. Hensel in London at that time called attention to the value of these examinations from the sanitary standpoint. In 1887 the Massachusetts state board of health began investigations of the waters of the Massachusetts rivers and lakes, and established a laboratory in which the microscopical examination of the water for the lower and higher forms of animal and vegetable life was conducted. Two years later the Connecticut state board of health begun a series of the same investigations and the establishment of laboratories. Boston, in 1889, established a biological laboratory at the Chestnut Hill reservoir. The microscopic part being under the charge of Mr. George Whipple. In 1897 Brooklyn established a laboratory at Prospect Park, and so throughout the country a number of biological and marine stations have been established for the study of micro-organisms
in water. The method of catching these micro-organisms
498 in a definite quantity of water has gradually developed.
First, a definite quantity of water, say a gallon, was allowed to sand until the micro-organism had settled to the bottom of the vessel. Then they were collected and studied. Next the water was filtered through a seive and the micro-organism caught upon the seive cloth, or whatever it might be, and then turned out on a glass slide, as we turn fish out of a net.

Later, Mr. Kean used a large funnel and in the neck of the funnel he placed a sand filter, and ran the water through this sand, the sand was put into a test tube and he washed it, decanted the fluid, and studied a definite quantity of it, one cubic millimeter upon a glass slide. In this way he secured a definite measurement of the water and attempting to discover the number of micro-organisms in the water.

Following that, Drs. Sedgwick and Rafter—which is now known as the Sedgwick-Rafter method—improved this method of Mr. Kean's, the slide method, and it was used for studying in this laboratory the waters of the various rivers which will be named. A definite quantity of water is taken, 500 cubic centimeters in our experiments was put into a special filtering apparatus which has a glass cylinder 9 inches long by 2 inches

499 in diameter at the top. It is funnel shaped at the bottom, that funnel portion being about 2½ inches to 3 inches long. Then there is a small neck 2½ inches long, and the diameter of the neck is about a half an inch. Into the neck of this filter of glass is placed a perforated cork, and on top of that cork is placed a piece of silk, so as to cover the hole in this cork. On top of that is placed about three quarters of an inch of green quartz, sand, not being used. The sand is of a size so that it will pass through the seive having 60 measures to the square inch, and not more than 120. That is the size of the sand grain. To the side or connected through the cork to one side is a small tube through which the water passes as it filters through the sand. That tube reaches as high as one inch, or to the height of the sand in the neck on the side of the glass. With the apparatus in order, 500 cubic centimeters of water are put into it, and the water allowed to filter through. When it has filtered, through, the tubelature on the side of the apparatus, allows all of the water to pass out except about one cubic centimeter which remains in the sand. The cork is removed and the sediment, this sand, is washed into a test tube with five or ten cubic centimeters of water, ten as a rule. The water and sand are stirred about, and then a definite quantity of it taken off. The quantity in this case was one cubic centimeter, say, that was pipetted off,
500 taken out in a pipette. That water is now floated on a
glass slide, which was prepared in this way. The glass slide had a brass rim upon it, a rectangular brass rim. That rim is 50 millometers long, 20 millometers wide, and 1 millometer deep. On top of this brass rim is placed a large cover of glass. The water is run into this slide—this one space will contain just one cubic centimeter of water—now, this rectangular space has poured into it this one cubic centimete [illegible] water. The cover-glass is slipped upon it so as to have as few air bubbles as possible underneath the cover glass, and the micro-organisms studied with a microscope.

In order to measure the micro-organisms in a definite quantity of water, the cover glass was at first ruled out into squares by Sedgwick, but later by Whipple the measuring apparatus was put into the ocular of the microscope. The measuring apparatus is a piece of glass one millometer square. This is divided into four cross lines, which gives four spaces. One of these spaces is divided into 25 squares, and each one of these squares is divided into 25 parts, and one of these 25ths is what is known as the standard unit of measure. Now with this measuring apparatus in the ocular the micro-organisms are studied, the whole field gone over, and a definite number of spaces measured and studied, and the number of micro-organisms of the different kinds counted and recorded.

501 The object of this examination, or rather, it had for its object, a study of the micro-organisms in all the waters under consideration, to discover micro-organisms connected with sewage pollution; and also to attempt to trace distinctive forms which are found in the Lake Michigan water, from those forms existing in the rivers and tributaries of the Illinois river and its tributary; the Missouri river, the Mississippi river above its junction with the Illinois, and the Mississippi river water at the intake, and in the St. Louis reservoir.

Two different sets of examinations were made, one in 1900, by Mr. George A. Johnson in my own laboratory at the old city hall in the city of St. Louis, and the other series of examinations were made by Mr. George H. Whipple, of Brooklyn, New York.

Q. Now you say you conducted the examination with a microscope?

A. I supervised this work.

Q. Examination of the water?

A. Yes sir.

Q. Now you examined in this connection the water of Lake Michigan, did you?

A. Yes sir.

Q. Where were these samples of water taken from and when? State briefly.

A. The samples for the microscopical examination for
502 Lake Michigan were collected first, July 23, from the four
mile crib.

Q. That is out in the lake from Chicago?

A. Out in the lake, four miles out. The next was collected July 30th from the Carter Harrison crib. This is 1900. And the third sample was collected August 9th ten miles out from the Chicago shore. The fourth sample was collected September 7th from the Lake View crib. And the fifth sample was collected September 15th from the two mile crib.

Q. When you mention the crib you mean the intake crib for the water supply of the city of Chicago?

A. Yes sir.

Q. Now that applies to all these samples except the sample taken ten miles from the Chicago shore?

A. Ten miles from the shore, yes sir.

Q. What year were those samples collected in?

A. 1900.

Q. Now you may give the result of that microscopical examination in detail?

A. Now this is from the four mile crib. And from the genus diatomaceae we have the asterionella, 100,

Cyclotella, 19,
Diatoma, 33,
503 Fragilliara, 6,
Navicula, 11,
Nitzschia, 60,
Synedra, 680,
Tabellaria, 30.

Now under the genus Cyanophycae we have:

Chrococcus, 3,
Oscillaria, 30.

Now under the genus Chloraphyceae we have:

Closterium, 1,
Pediastrum, 6,
Rephidium, 4,
Scenedesmus, 10,
Spyrogyra, 1,
Ulothrix, 22.

Now under the genus Shycomycetes we have:

Crenothrix, 6.

Now under the genus Protezoa we have:

Anoba, 2,
Cryptonomas, 2,
Dinobryon, 25,
Glenoinium, 15,
Protozoa monas, 6,

Pendinium, 10,
Synura, 2,
Vorticella, 1.

Now under the genus Rotifera we have the

Anaurea, 4,
504 Rotifier, 2,
Polyarthara, number not given.

Now under the genus Crustacae, daphnia, number not given.

Now we have the miscellaneous. Under that comes:

Vegetable hair, 4,
Ober, 21,

So we have the total number here, 1118,

Genera, 30.

Now that is for the sample collected July 23.

Now for the sample collected July 30th, at the Carter Harrison crib:

Under the genus diatomacae we have:

Asterionella, 42.

Q. Do you mean this is the number of organisms per cubic centimeter?

A. Per 500 cubic centimeters. You see 100 asterionella would keep things pretty busy in one cubic centimeter.

Cyclotella, 12,
Diatoma, 65,
Fragilliara, not found in Carter Harrison crib.
Navicula, 4,
Nitzschia, 93,
505 Synedra, 400,
Tabellaria, 12.

Genus cyanophyceae:

Chrococcus, not found in the Carter Harrison crib,
Oscillaria, 20.

Genus Chlorophyceae:

Closterium, 1,
Pediastrum, 9,
Rephidium, 16,
Scenedesmus, 4,
Ulothrix, 10.

Genus Shycomycetes:
Crenothrix, 3.
Genus Protozoa:
Dinobryon, 31,
Glenodinium, 6,
Monas, 15,
Peridinium, 3,
Synura, 6,
Vorticella, 2.
Genus Rotifiera:
Anaurea, 1,
506 Rotifer, 4,
Polyarthara, 1.
Genus, Crustaceae:
Daphnia, 1.
Miscellaneous:
Vegetable hair, 7,
Ober, 6.
Total number, 774.
Genera, 26.

Amorphus matter very abundant in all samples.

Q. It applies to all samples taken out of all these cribs?

A. Very abundant in all samples, yes sir. So I can wipe that out of this particular examination. Going back again to the samples collected August 9, 1900, ten miles from the Chicago shore. Under the

Genus diatomacae:
Asterionella, 10,
Diatoma, 3,
Frageliera, 12,
Navicula, 14,
Nitzschia, 86,
Synedra, 290,
Tabellaria, 26.
Genus Chlorophyceae:
Pediastrum, 2.

Q. Now about the Cyanophyceae being out, do you mean 507 it was absent or not found?

A. It was not found.

Scenedesmus, 4,
Ulothrix, 6.
Genus protozoa:
Amoba, 6,
Cryptomas, 1,
Dinobryan, 14,
Genodinium, 8,
Monas, 9,
Synura, 4,
Bordacella, 1.
Genus rotiferia:
Anaurea, 3,
Rotifer, 1,
Polyarthara, 2.
Genus crustaceae:
Daphnia, 1.
Miscellaneous:
Vegetable hair, 4,
Ober, 10.
Total number, 517,
Genera, 23,
Amorphus matter abundant.

Q. That is in the waters of Lake Michigan?

508 A. Yes sir. Now the sample collected September 7 from the Lake View Crib was as follows:

Genus Diatomacae:
Asterionella, 84,
Cyclotella, 4,
Diatoma, 31,
Nitzschia, 47,
Synedra, 100.
Genus Cyanophycae:
Chrococcus, 6.
Genus chlorophyceae:
Clostrium, 1,
Pediastrum, 12,
Rephidium, 4,
Scenedesmus, 3,
Spyrogyra, 4,

Ulothrix, 14.
Genus shycomycetes:
Chenothrix, 2.
Genus protozoa:
Glenodinium, 2,
Monas, 12.
Genus rotifera:
Anaura, 1,
509 Rotifer, 2,
Miscellaneous:
Vegetable hair,
Ober, 16,
Total number, 347,
Genera, 19.

Amorphus matter abundant in all samples.

Sample collected September 15, from two mile crib is as follows:

Genus diatomacae:
Asterionella, 100,
Cyclotella, 16,
Diatoma, 14,
Nitzschia, 62,
Synedra, 200.
Genus Scanophyceae:
Oscillaria, 15.
Genus Chlorophyseae:
Pedeastrum, 9,
Spyrogyra, 1,
Ulothrix, 6.
Genus schycomycetes:
Crenothrix, 1.
Genus protozora:
Amoba, 1,
Dynobryon, 6,
Glenodinium, 4,
510 Monas, 19,
Synura, 1.
Genus rotifiera:
Rotifer, 1.

Miscellaneous:
    Vegetable hair, 6,
    Ober, 10,
.Total number, 472,
Genera, 18.

Q. Give us the result of the microscopical examination of the discharge of the Chicago Drainage canal before it passes over the bear trap dam at Lockport, Illinois, and state when they were made.

A. Do you want me to state it now as I go along?

Q. As you go. .

A. Collected May 27, 1900, as follows:

Genus diatomacae:
    Asterionella, 71,
    Cyclotella, 8,
    Diatoma, 32,
    Himantidium, 2,
    Navicula, 4,
    Nitzschia, 23,
    Synedra, 313,
    Tabaleria, 55.
Genus cyanophyceae:
511 Oscillaria, 15.
Genus chloraphycae:
    Closterium, 5,
    Hydrodiction, 12,
    Protocockys, 2,
    Rephidium, 17,
    Ulothrix, 15.
Genus Shycomycetes:
    Beggattoa, 2,
    Crenothix, 6.
Genus protozoa:
    Monas, 32,
    Paramecium, 13,
    Synura, 19,
    Vordicella, 7.
Genus crustaceae:
    Bosimia, 1,

Daphnoa, 1.
Miscellaneous:
  Mouldohifphe, 3,
  Amoeba, 23.
Total number, 681,
Genera, 24,
Amorphus matter abundant.
Sample collected June 3, 1900,
Genus diatomacae:
  Asterionella, 73,
512 Cyclotella, 2,
  Fragelleria, 6,
  Diatoma, 22,
  Himantidium, 4,
  Navicula, 6,
  Nitzschia, 7,
  Cynedra, 116,
  Tabilleria, 16.
Genus Cyanophyceae:
  Oscilleria, 22.
Genus Chlodaphyceae:
  Arthrodesmus, 2,
  Endoria, 1,
  Hydrodiction, 19,
  Protococcus, 4,
  Rephidium, 7,
  Unithrix, 11.
Genus protozoa:
  Protomonus, 8,
  Dinobryon, 2,
  Monus, 19,
  Synura, 6,
  Trchelomonas, 8,
  Vordicella, 4.
Genus rotifiera:
  Anaurea, 2,
513 Vegetable hair, 15,
  Ober, 12.

Total number, 402,
Genera, 27.
Sample collected June 10, 1900, is as follows:
Genus diataneace:
    Asterionella, 18,
    Cyclotella, 1,
    Diatoma, 4,
    Navicula, 1,
    Stephnodiscus, 1,
    Synedra, 101,
    Tabileria, 5.
Genus cyanophyceae:
    Oscilleria, 38.
Genus chloraphycae:
    Arthrodesmus, 1,
    Rhephidium, 2,
    Ulothrix, 16.
Genus schizomycetes:
    Beggattoa, 4,
514 Crenothrix, 3,
    Liptothrix, 6.
Genus protozoa:
    Protomonus, 12,
    Monus, 21,
    Paramacium, 14,
    Placus, 2,
    Cynora, 3,
    Vordicella, 4.
Genus rotifiera:
    Rotifer, 2.
Genus crustacae:
    Bosmia, 1.
Miscellaneous:
    Mouldhifphe, 10,
    Vegetable hair, no number.
Genera, 25,
Total, 296.
Amorphus matter abundant.
Sample collected June 17, 1900, as follows:

Genus diatomacae:
  Asterionella, 120,
515 Cymbella, 14,
  Diatoma, 23,
  Myrodeon, 6,
  Nitzschia, 1,
  Stephnodiscus, 1,
  Synedra, 180,
  Tabilleria, 16.
Genus canophyceae:
  Chrococcus, 4,
  Lyngbia, 1,
  Oscileria, 4.
Genus chlorophycae:
  Pedeastrum, 2,
  Pandoriana, 3,
  Protococcas, 1,
  Spyrogyra, 4,
  Ulothrix, 10.
Genus protozoa:
  Protomonus, 2,
  Monus, 6,
  Paramecium, 12.
Genus crustaceae:
  Daphnia, 1.
516 Miscellaneous:
  Anguilulla, 1.
Total number, 412,
Genera, 21.
Amorphus matter very abundant.
Sample collected June 25, 1900, is as follows:
Genus diatomacae:
  Asterionella, 40,
  Cymbella, 20,
  Himantidium, 1,
  M, 10,
  Nitzschia, 14,
  Synedra, 96,
  Tabilleria, 3.

Genus cyanophycae:
    Anabaene, 2,
    Coelosphaerium, 1.
Genus chlorophycae:
    Arthadesmus, 4,
    Prosterium, 1,
    Hydrodiction, 6,
517 Pedeastrum, 2,
    Scenedesmus, 5.
Genus schizomycetes:
    Crenothrix, 2.
Genus protozoa:
    Monus, 47,
    Paramacium, 38,
    Placus, 2,
    Cynura, 1,
    Vorticella, 6.
Genus rotifiera:
    Polyauthra, 1,
    Rotifer, 2.
Miscellaneous:
    Vegetable hair, 3,
    Ober, 1,
    Mouldhifphe, 10.
Genera, 25.
Amorphus matter abundant.
The sample collected July 11th, 1900, is as follows:
Genus Diatomaceae:
    Asterionella, 10,
518 Cyclotella, 4,
    Diatoma, 32,
    Meridiom, 6,
    Nitzschia, 6,
    Senedra, 30,
    Caballeria, 10.
Genus Cyanophyceae:
    Endoriana, 3,
    Chrococcus, 6,
    Coelesphaerium, 4,

Lyngbia, 2,
Oscillaria, 10.
Genus Chlorophyceae:
Dictospherium, 1,
Endoriana, 1,
Protococcus, 1,
Rephidium, 2,
Ulothrix, 8.
Genus Schizomycetes:
Beggatoa, 10.
Genus Protozoa:
Protococcus, 8.

The sample collected July 11th, 1900, is as follows:

Genus Diatomaceae:
Asterionella, 10,
519 Cyclotella, 4,
Diatoma, 32,
Meridiom, 6,
Nitzschia, 6,
Senedra, 30,
Caballeria, 10.
Genus Cyanophyceae:
Endoriana, 3,
Chrococcus, 6,
Coelesphaerium, 4,
Lyngbia, 2,
Oscillaria, 10.
Genus Chlorophyceae:
Dictospherium, 1,
Endoriana, 1,
Protococcus, 1,
Rephidium, 2,
Ulothrix, 8.
Genus Schizomycetes:
Beggatoa, 10.
Genus Protozoa:
Protococcus, 8,
520 Protomonas, 8,
Monas, 6,

Perimecium, 10,
Chelomonas, 1,
Vorticello, 2.

Genus Rotifera:
Rotifa, 3.

Miscellaneous:
Anguillulla, 1,
Mouldhifpe, 5.

Total number, 185,
Genera, 25.
Amorphous matter very abundant.

The sample of July 20th, 1900, is as follows:

Genus Diatomaceae:
Asterionella, 6,
Diatoma, 10,
Navicula, 6,
Nitzschia, 28,
Cynedra, 40,
Cabellaria, 14.

Genus Cyanophyceae:
521 Coelosphaerium, 2,
Oscillaria, 6.

Genus Chlorophyceae:
Arthrodesmus, 2,
Dictiosphaerium, 1,
Pediastrum, 6,
Ulothrix, 2.

Genus Schizomycetes:
Beggattoa, 8,
Chrenofix, 12.

Genus Protozoa:
Monas, 2.

Miscellaneous:
Vegetable hair, 2.

Total number, 147,
Genera, 16.
Amorphous matter abundant.

Sample collected July 30th, 1900, is as follows:

Genus Diatomaceae:

Asterionella, 128,
Cyclotella, 16,
Hymentidium, 6,
522 Nitzschia, 4,
Cynedra, 88,
Genus Cyanophyceae:
Lyngbia, 2.
Genus Chlorophyceae:
Hydrodiction, 4.
Genus Schizomycetes:
Beggattoa, 3.
Genus Protozoa:
Protö monas, 2,
Parimecium, 14,
Synura, 2.
Genus Rotifero:
Rotifa, 2.
Crustaceae Genus:
Daphnia, 1.
Miscellaneous:
Mouldhifpe, 6,
Vegetable hair, 4,
Ober, 2.
Total number, 284,
Genera, 16.
Sample collected August 10th, 1900, is as follows:
Genus Diatomyceae:
Asterionella, 130,
Cyclotella, 3,
523 Diatoma, 16,
Meridiom, 7,
Cynedra, 300,
Tabellaria, 6.
Chlorophyceae genus:
Arthrodesmus, 1,
Protomonas, 4,
Rephidium, 2.
Protozoa genus:
Protomonas, 2,

Monas, 4,
Parimecium, 31,
Vorticello, 1.
Miscellaneous:
Mouldhiphe, 7,
Total number, 514,
Genera, 14.
Amorphous matter abundant.
Sample collected August 18th, 1900:
Diatomaceae:
Asterionella, 39,
Diatoma, 9,
Navicula, 14,
Nitzschia, 12,
524 Cynedra, 220,
Tabellaria, 4.
Genus Cyanophyceae:
Chrococcus, 2,
Lyngbya, 2,
Oscillaria, 6.
Genus Chlorophyceae:
Ebdoriana, 1.
Genus Protozoa:
Monas, 6,
Paramecium, 4,
Vorticella, 2.
Genus Rotifera:
Rotifa, 2.
Total number, 329,
Genera, 15.
Amorphous matter present in abundance.

Microscopical examination of the Des Plaines River at Joliet. The sample collected May 17th, 1900, is as follows:

Genus Diatomaceae:
Asterionella, 34,
Cyclotella, 3,
Diatoma, 17,
Hymentidium, 10,
525 Navicula, 5,

Nitzschia, 40,
Cynedra, 153,
Tabellaria, 6.
Genus Cyanophyceae:
Lyngbya, 3,
Oscillaria, 58.
Chlorophyceae Genus:
Spyrogyra, 4.
Schizomycetes genus:
Chrenothrix, 3,
Protozoa genus:
Monas, 2,
Protomonas, 7,
Vorticella, 4.
Rotifiera:
Rotifa, 3.
Miscellaneous:
Anguillula, 1,
Ober, 5.
Total number, 389,
526 Genera, 18,
Amorphous matter abundant.

MR. JEFFRIES: Now before we go to the next sample let me ask you if you know the particular place in the river that these samples were taken, whether above or below Joliet?

A. These samples were all collected at the same place, McDonnough Street, the same as the bacterioligical samples for this 1900 period. It represents the mixture of the Des Plaines River water; of the Chicago Drainage Canal and the waters of the Illinois and Michigan Canal.

Q. Is that above the entrance of the Joliet sewage?

A. Yes sir, it is above the Joliet sewage. The sewage comes in along there from the supply works; it does not enter here.

May 3rd, 1900. Result of the microscopical examination of the Des Plaines River at Joliet, Illinois: The Genus is as follows:

Diatomaceae:
Asterionella, 82,
Cyclotella, 6,

Diatoma, 29,
Hymentidium, 8,
Navicula, 5,
Nitzschia, 12,
Cynedra, 196,
Tabellaria, 42.
Cyanophyceae:
527 Lyngbya, 3,
Oscillaria, 60.
Chlorophyceae:
Prosterium, 2,
Desmidium, 1,
Pediastrum, 2,
Scenedesmus, 2.
Protozoa:
Protomonas, 2,
Monas, 27,
Paramecium, 3,
Vorticella, 3.
Rotifera:
Rotifa, 1,
Miscellaneous:
Vegetable hair, 21,
Ober, 1.
Total number, 507.
Genera, 21.
Amorphous matter abundant.
Sample collected June 10th, 1900:
Genus Diatomaceae:
Asterionella, 96,
528 Navicula, 12,
Nitzschia, 34,
Cynedra, 200,
Tabellaria, 12.
Cyanophyceae:
Oscillaria, 10.
Chlorophyceae:
Desmidium, 2,
Pediastrum, 5,

- Protomonas, 4,
  - Rephidium, 2,
  - Scenedesmus, 6.
- Protoza:
  - Monas, 10,
  - Paramecium, 1.
- Miscellaneous:
  - Vegetable hair, 10,
  - Ober, 4.
- Total number, 408,
- Genera, 16.
- Amorphous matter very abundant.
- Sample collected June 17th, 1900, as follows:
- Diatomaceae:
  - Asterionella, 38,
  - 529 Cynedra, 90,
  - Cyclotella, 2,
  - Diatoma, 2,
  - Nitzschia, 20.

- Ober, 2.

Total number, 654,
Genera, 23.
Amorphous matter very abundant.
Sample collected July 11th, 1900:
Genus Diatomaceae:
- Asterionella, 80,
- Cyclotella, 1,
- Diatoma, 6,
- Hymentidium, 2,
- Navicula, 19,
- Nitzschia, 60,
- Cynedra, 240,

Tabellaria, 4.

Cyanophyceae:

Lyngbya, 1,

Oscallaria, 75.

Chlorophyceae:

Pediastrum, 1,

Ulothrix, 6.

Protozoa:

Monas, 2,

532 Paramecium, 2,

Synura, 3,

Protomonas, 2,

Vorticella, 1.

Rotifera:

Rotifa, 1.

Crustaceae:

Daphnia, 1.

Miscellaneous:

Vegetable hair, 2,

Ober, 33.

Total number, 542,

Genera, 21.

Amorphous matter very abundant.

Q. MR. JEFFRIES: Now doctor, with reference to the microscopical examination of the Illinois River, I will ask you to state where that water was taken from?

A. It is a microscopical examination of the Illinois River two miles above Peoria, Illinois, organisms per cubic centimeter and taken upon the dates last before named.

Q. The samples of all these waters were taken out in the current were they?

A. Out in the channel?

533 Q. Three feet from the surface?

A. Three feet from the surface, yes sir, according to the method laid down by Mr. Whipple.

Samples collected July 27th, 1900 is as follows:

Genus Diatomaceae:

Asterionella, 41,

Diatoma, 12,

Nitzschia, 23,
Cynedra, 71.
Cyanophyceae:
Oscillaria, 5.
Chlorophyceae:
Closterium, 1,
Pediastrum, 19,
Protomonas, 4,
Scenedesmus, 14,
Spyrogyra, 5.
Protozoa:
Protomonas, 9,
Monas, 22,
Synura, 3,
Rotifera:
534 Anaurea, 4,
Polyarthro, 4.
Crustacae:
Cyclops, 2,
Daphnia, 4.
Miscellaneous:
Aerina, 4,
Ober, 4.
Total number, 252,
Genera, 20.
Amorphous matter very abundant.
Sample collected June 3rd, 1900:
Diatomaceae:
Asterionella, 61,
Cyclotella, 8,
Diatoma, 38,
Navicula, 9,
Nitzschia, 6,
Cynedra, 100,
Tabellaria, 12.
Chlorophyceae:
Closterium, 2,
Pediastrum, 29,
535 Protomonas, 6,

Scenedesmus, 9,
Spyrogyra, 12.
Protozoa:
Protomonas, 6,
Monas, 12,
Vorticella, 3.
Rotifera:
Anaurea, 1.
Crustaceae:
Cyclops, 2,
Daphnia, 1.
Miscellaneous:
Ober, 12.
Total number, 327,
Genera, 19.
Amorphous matter very abundant.
Sample collected June 10th, 1900:
Genus Diatomaceae:
Asterionella, 186,
Diatoma, 6,
Nitzschia, 27,
Cynedra, 22,
Chlorophyceae:
Arthrodesmus, 1,
536 Closterium, 1,
Conferva, 6,
Bandoriana, 1,
Pediastrum, 12,
Scenedesmus, 18,
Spyrogyra, 12,
Ulothrix, 6.
Protozoa:
Monas, 4,
Paramecium, 2,
Synura, 2,

Crustaceae, 1.

Miscellaneous:
    Ober, 6.
Total number, 316,
Genera, 19,
Amorphous matter very abundant.
Sample collected June 18th, 1900:
Genus Diatomaceae:
    Asterionella, 21,
537 Diatoma, 31,
    Nitzschia, 31,
    Cynedra, 98.
Cyanophyceae:
    Oscillaria, 16.
Chlorophyceae:
    Closterium, 2,
    Pediastrum, 6,
    Protococcus, 5,
    Scenedesmus, 6,
    Spyrogyra, 12,
    Zynmena, 2.
Protozoa:
    Protomonas, 2,
    Paramecium, 2,
    Vorticella, 2,
Miscellaneous:
    Anguillula, 1,
    Aorina, 1.
Total number, 238,
Genera, 16,
Amorphous matter very abundant.
Sample collected June 25th, 1900:
Diatomaceae:
    Asterionella, 94,
538 Clycotella, 16,
    Navicula, 12,
    Nitzschia, 40,
    Cynedra, 209.
Cyanophyceae:

Oscillaria, 64.
Chlorophyceae:
Arthrodesmus, 1,
Protococcus, 10,
Scenedesmus, 5,
Ulothrix, 30.
Protozoa:
Peredinium, 1,
Vorticella, 5.
Crustaceae:
Cyclops, 2,
Daphnia, 1,
Miscellaneous:
Anguillula, 3,
Vegetable hair, 16,
Ober, 24.
Total number, 542,
539 Genera, 17,
Amorphous matter very abundant.
Sample collected July 11th, 1900:
Genus Diatomaceae:
Asterionella, 120,
Cyclotella, 4,
Diatoma, 4,
Nitzschia, 14,
Cyclotella, 153,
Tabellaria, 12.
Cyanophyceae:
Oscillaria, 50,
Chlorophyceae:
Bandoriana, 1,
Protococcus, 6,
Scenedesmus, 5,
Ulothrix, 40.
Protozoa:
Monas, 3,
Paramecium, 1.
Rotifera:
Rotifa, 1.

Crustaceae:
Cyclops, 2
540 Daphnia, 2.
Miscellaneous:
Vegetable hair, 4.
Total number, 420,
Genera, 16,
Amorphous matter very abundant.
ADJOURNED until 2:00 P. M., Monday, February 23, 1903.

541 2:00 P. M., Monday, February 23, 1903, Continuation after recess. Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD, resumed the stand for further direct-examination, by Mr. Jeffries.

Q. Where are we now, doctor?

A. We are at microscopic examination of the Illinois River just above Grafton, Illinois. Now we begin on the microscopic examination of the Illinois River water just above Grafton,—three miles—

Q. Three miles above Grafton?

A. Three miles above Grafton, yes sir.

The next is genus diatomaceæ—this sample was collected May 28, 1900. Of the asterionella we have 18.

Cyclotella, 1,
Diatoma, 7,
Himantidium, 1,
Melosira, none,
Navicula, 2,
Nitzschia, 4,
Stephanodiscus, 1,
Synedra, 46.

542 Under Genus Cyanophyceæ, we have—
Lyngbya, 1,
Oscillaria, 1.
Genus cholorophyceæ:
Hydrodiction, 1,
Pediastrum, 4,

Scenedesmus, 4,
Spyrogyra, 2,
Ulothrix, none.
Genus Schizomycetes:
Crenothrix, 1.
Under Protozoa, we have
Cryptomonas, 2,
Monas, 8,
Synura, 3,
Vorticella, 1.
Miscellaneous:
Vegetable hair, 5,
Total number, 114,
Genera, 20.
Amorphous matter very abundant.

We go to sample collected June 3, 1900, under the genus diatomaceæ:

Asterionella, 43,
Diatoma, 4,
Melosira, 2,
Nitzschia, 14,
543 Pleurosigma, 1,
Synedra, 280.
Genus cyanophyceæ:
Species Oscillaria, 28.
Under Chlorophyceæ, we have
Endoriana, 2,
Pediastrum, 8,
Protococcus, 4,
Scenedesmus, 24,
Ulothrix, 11.
Under Protozoa:
Monas, 12,
Paramecium, 1,
Synura, 2,
Total number, 436,
Genera, 15,
Amorphous matter abundant.

June 10, under genus Diatomaceæ:

Asterionella, 7,
Diatoma, 2,
Nitzschia, 12,
Synedra, 140,

Under Cyanophyceæ, we have
Oscillaria, 20.

Under Chlorophyceæ we have
Protococcus, 19.

544 Under Protozoa we have
Monas, 6,
Perimecium, 1,
Total number, 207,
Genera, 8.

Sample collected June 8:
Asterionella, 8,
Cyclotella, 3,
Nitzschia, 3.
Synedra, 22.

Under Cyanophyceæ:
Oscillaria, 4.

Under Chlorophyceæ:
Arthrodesmus, 3,
Closterium, 1,
Pediastrum, 4,
Synura, 4,
Vorticella, 2.

Under Rotifera:
Rotofa, 2,
Total number, 56.
Genera, 11,
Amorphous matter very abundant.

June 25:

Diatomaceæ:
Asterionella, 30,
Cyclotella, 2,
545 Nitzschia, 6,
Synedra, 90.

Under Chlorophyceæ, we have
Protococcus, 6,

Scenedesmus, 8,
Spyrogyra, 3,
Ulothrix, 6.

Under Protozoa, we have
Cryptomonas, 1,
Monas, 1,
Total number, 155,
Genera, 11,
Amorphous matter abundant.

Illinois River at Grafton, July 11.

Diatomaceæ:
Diatoma, 2,
Navicula, 2,
Nitzschia, 6,
Pleurosigma, 1,
Synedra, 170.

Under Chlorophyceæ:
Arthrodesmus, 6,
Closterium, 1,
Protococcus, 7,
Scenedesmus, 10,
Spyrogyro, 3,
Ulothrix, 9.

546 Under the protozoa we have:
Monas, 2,
Peremecium, 1,
Synura, 4.

Under Miscellaneous:
Vegetable hair, 4,

Total number, 244.

Genera, 16.

Amorphous matter very abundant.

That ends that.

Now the microscopic examination of the Mississippi River water two miles above Grafton, Illinois,—organisms per cubic centimeter. Sample collected May 28, 1900:

Under Diatomaceæ:
Asterionella, 4,
Diatoma, 3,

Meridiom, 4,
Navicula, 6,
Nitzschia, 9,
Synedra, 30,
Tabellaria, 7,
Under Cyanophyceæ:
Oscillaria, 2,
Under Chlorophyceæ:
Desmedium, 1,
Hydrodictyon, 17,
547 Pediastrum,
Scenedesmus, 8,
Ulothrix, 12,
Protozoa:
Cryptomonas, 1,
Monas, 3,
Synura, 5,
Roteferia anoria, 1.
Miscellaneous:
Vegetable hair, 6.
Total number, 125,
Genera, 18,
Amorphous matter very abundant.
Sample collected June 3, 1900:
Diatromaceæ:
Asterionella, 39,
Cyclotella, 4,
Diatoma, 12,
Nitzschia, 60,
Synedra, 49,
Tabellaria, 2.
Cyanophyseæ:
Oscillaria, 14.
Chlorophyceæ:
Pediastrum, 17,
Scenedesmus, 16,
Ulothrix, 22.
548 Protozoa:
Monas, 10,

Perimesium, 1,
Synura, 2.
Miscellaneous:
Vegetable hair, 12.
Total number, 260,
Genera, 14.
Amorphous matter very abundant
July 11:
Diatomaceæ:
Asterionella, 12,
Cymbella, 2,
Nitzschia, 12,
Synedra, 239,
Tabalaria, 6.
Cyanophyceæ:
Oscillaria, 2.
Chlorophyceæ:
Closterium, 1,
Protococcus, 5,
Glenodinium, 1.
Protozoa:
Monas, 5,
Synuria, 2.
549 Under Rotifera:
Rotofa, 1,
Vegetable hair, 2,
Total number, 286.
Genera, 13.
Amorphous matter very abundant in all.

Q. MR. JEFFRIES: Now the microscopic examination of the Mississippi River water one mile above Alton?

A. Sample collected May 28, 1900:
Diatomaceæ:
Asterionella, 12,
Cyclotella, 4,
Cymbella, 2,
Diatoma, 8,
Meridiom, 6,
Narvicula, 8,

Nitzschia, 10,
Synedra, 41,
Tabellaria, 9.
Cyanophyceæ:
Lyngbya, 2,
Oscillaria, 2.
Under Chlorophyceæ we have:
Arthrodesmus, 4,
Closterium, 2,
Hydrodictyon, 4,
550 Pediastrum, 9,
Protococcus, 3,
Scenedesmus, 4,
Spyrogyra, 1,
Ulothrix, 4,
Under Protozoa:
Cryptomonas, 3,
Monas, 12,
Paramecium, 1,
Vorticella, 1.
Miscellaneous:
Vegetable hair, 5.
Total number, 153,
Genera, 25,
Amorphous matter abundant.
June 3, 1900:
Diatomaceæ:
Asterionella, 4,
Diatoma, 4,
Navicula, 2,
Nitzschia, 5,
Synedra, 220,
Taballaria, none.
Cyanophyceæ:
Oscillaria, 19.
Chlorophyceæ:
Pediastrum, 38,
551 Protococcus, 4,
Scenedesmus, 16,

Spyrogyra, 5,
Ulothrix, 29.

Protozoa:
Monas, 8,
Synura, 3.

Rotiferia:
Rotofa, 1.

Miscellaneous:
Vegetable hair, 6.

Total number, 314.

Genera, 15,

Amorphous matter very abundant.

Sample collected July 11, 1900:

Diatomaceæ:
Asterionella, 60,
Diatoma, 4,
Navicula, 2,
Nitzschia, 15,
Synedra, 96,
Tabellaria, 6.

Chlorophyceæ:
Arthrodesmus, 1.
Desidious, 2.
Pediastrum, 11.
Scenedesmus, 12.

552 Protozoa:
Monas, 3,
Perimecium, 1.
Synura, 3.

Rotiferia:
Anaurea, 1.

Miscellaneous:
Vegetable hair, 2.

Total number, 219.

Genera, 15.

Amorphous matter abundant.

Q. MR. CROW: Now, have you made a microscopic examination of the Mississippi river water opposite Hartford, Illinois?

A. Yes, sir.

Q. Where is Hartford, Illinois?

A. Hartford, Illinois, is about seven miles below Alton, about one mile above the mouth of the Missouri river, where it empties into the Mississippi.

Q. Have you got a statement of the result of that analysis?

A. Yes, sir.

Q. Just give it, please.

A. May 29, 1900:

Diatomaceæ:
- Asterionella, 9.
- Cyclotella, 4.
- Cymbella, 3,
- Diatoma, 6.
- 553 Himantidium, 3.
- Meridiom, 2.
- Navicula, 5.
- Nitzschia, 19.
- Synedra, 50.
- Tabellaria, 12.

Under Cyanophyceæ:
- Coelophaerium, 4.
- Lyngbya, 6.
- Oscillaria, 4.

Chlorophyceæ:
- Flosterium, 1.
- Desmidium, 2.
- Dictiospherium, 6.
- Hydrodictyon, 1.
- Pediastrum, 12.
- Protococcus, 2.
- Scenedesmus, 6.
- Spyrogyra, 4.

Protozoa:
- Cryptomonas, 3.
- Monas, 10.
- Synura, 9.

Miscellaneous:
- Vegetable hair, 7.

Total number, 191.

Genera, 25.

Amorphous matter abundant.

554 Sample collected June 3, 1900:

Diatomaceæ:
  Asterionella, 14.
  Cyclotella, 1.
  Nitzschia, 30.
  Synedra, 60.
  Tabellaria, 4.
Cyanophyceæ:
  Coelosphærium, 4.
  Oscillaria, 10.
Chlorophyceæ:
  Desmidium, 2.
  Dictiospherium, 2.
  Pediastrum, 6.
  Scenedesmus, 12.
Protozoa:
  Cryptomonas, 4.
  Monas, 12.
  Synura, 3.
Miscellaneous:
  Vegetable hair, 11.
Total number, 171.
Genera, 14.
Amorphous matter abundant.

July 11, 1900:
Under Diatomaceæ:
  Asterionella, 4.
555 Cymbella, 2.
  Diatoma, 5.
  Hymentidium, 2.
  Navicula, 6.
  Nitzschia, 12.
  Synedra, 22.
  Tabellaria, 4.
Cyanophyceæ:
  Coelosphærium, 5.
  Oscillaria, 10.
Under Chlorophyceæ:
  Arthrodesmus, 2.

Cloesterium, 1.
Desmidium, 3,
Pediastrum, 4.
Protococcus, 5.
Scenedesmus, 19.
Spyrogyra, 8.
Ulothrix, 10.

Under Protozoa:

Monas, 8.
Perimecium, 2.
Synura, 3.
Vorticella, 2.

Under Rotifera:

Rotifo, 1.

Miscellaneous:

Vegetable hair, 2.

556 Total number, 142.
Genera, 24.

Amorphus matter abundant.

That is the last one of that.

Q. Now, was there a microscopic examination of the Mississippi River water at In-take tower at St. Louis waterworks?

A. Yes sir.

Q. At what time?

A. On the dates thereon.

Q. May 28, June 3, July 11, of what year?

A. 1900.

Q. You have got the result of that examination, have you?

A. Yes sir.

Q. Just put it in the record.

A. May 28, 1900, microscopical examination of Mississippi River water at the in-take of the St. Louis waterworks:

Diatomaceæ:

Asterionella, 21,
Merediom, 6,
Nitzschia, 32,
Synedra, 40,
Tabellaria, 8.

Cyanophyceæ:
  Oscillaria, 20.
Chlorophyceæ:
  Arthrodesmus, 1,
  Closterium, 3,
557 Desmedium, 3,
  Pediastrum, 16,
  Protococcus, 5,
  Scenedesmus, 26,
  Ulothrix, 4,
Protozoa:
  Monas, 6,
  Perimecium, 1,
  Synura, 3.
Rotiferia:
  Rotifo, 2.
Miscellaneous:
  Vegetable hair, 3,
  Total number, 194,
Genera, 16,
Amorphous matter abundant.
Sample collected June 3, 1900:
Diatomaceæ:
  Asterionella, 4,
  Cyclotella, 2,
  Cymbella, 1,
  Navicula, 14,
  Nitzschia, 24,
  Synedra, 12,
  Tabellaria, 6.
Cyanophyceæ:
  Oscillaria, 16.
559 Chlorophyceæ:
  Desmedium, 3,
  Pediastrum, 9,
  Scenedesmus, 8.
Protozoa:
  Cryptomonas, 2,
  Monas, 12.

Miscellaneous:
    Anguilula, 1,
Total number, 114.
Genera, 14.
Amorphous matter abundant—very abundant.
July 11, 1900:
Diatomaceæ:
    Asterionella, 16,
    Cyclotella, 2,
    Diatoma, 2,
    Hymentidium, 2,
    Meridiom, 8,
    Navicula, 11,
    Nitzschia, 16,
    Synedra, 39,
    Tabellaria, 12,
    Caelosphaerium, 2,
    Oscillaria, 22,
Chlorophyceæ:
    Arthrodesmus, 1,
    Closterium, 2,
    Hydrodictyon, 4,
    Pediastrum, 3,
    Scenedesmus, 14,
    Spyrogyra, 1,
    Ulothrix, 8,
Protozoa:
    Monas, 9,
    Perimecium, 1.
Miscellaneous:
    Anguilula, 1,
    Vegetable hair, 1,
    Total number, 176,
    Genera, 21,
Amorphous matter very abundant.
That is all the tables.

Q. Now, doctor, I want to identify this thing. In the first place is there anything on it that will identify it?

A. It is marked on the side here.

Q. Whereabouts?

A. Bacteria per cubic centimeter.

Q. Now doctor, what is this chart that I show you?

A. This chart is a graphic representation of the number of micro-organisms found in the Illinois River at Grafton, a weekly estimation.

560 Q. Weekly examination?

A. No, it is a weekly estimation, taken from the daily numbers in samples obtained of numbers of bacteria in samples obtained at this point.

Q. In what time?

Beginning January 23,—the next estimation January 30,
February 6, 13, 20, 27,
March 6, 13, 20, 27,
April 3, 10, 17, 24,
May 1, 8, 15, 22, 29,
June 5, 12, 19, 26,
July 3, 10, 17, 24, 31,
August, 7, 14, 21, 28,
September 4, 11, 18, 25,
October 2, 9.

Q. Of what year?

A. For the year 1900.

Q. Now the estimates are made of the total number of bacteria in the river at that point during the designated periods of time, without regard to the classification of the bacteria?

A. Yes sir.

Q. Now doctor, will you please explain this chart in your own way. In the first place, this chart was made under your supervision?

A. Yes sir.

Q. And by your direction? A. Yes sir.

561 Q. And is intended for what specific purpose?

A. To represent graphically,—that is to the eye easily,—a picture of the number of bacteria weekly calculated from the daily numbers collected in samples at this point.

Q. As shown by the tables?

A. As shown by the tables which have already been submitted for these different points.

Q. Now doctor, will you please explain the details of the map,—what the coloring and the lines mean?

A. Well, arranged perpendicularly here you see the numbers of bacteria, beginning with zero, 1,000, 2,000, 3,000, on up until there are 200,000 spaces here. In some places the number has run above 200,000, as for instance in the week ending February 13, large numbers are recorded. This piece of paper is not large enough to graphically represent that. The number consequently is written at the top of that week, 257,000, 441,000, 443,000, 267,000, 239,000, 204,000. The map would have to be extended twice as far to represent that. Now that is graphically represented for Grafton, from this date, January 23, to October 9.

Q. Now doctor, you have there then the variations?

A. Yes sir.

Q. The weekly variations?

A. Yes sir.

Q. At Grafton during that period?

A. Yes sir.

562 Q. Will you please give them as indicated by your map here?

A. The first week the total number, ending January 30, 1900, is 116,000; for the second week, ending February 6, it drops to 109,000,—estimated by the week. Week ending February 13, the number amounts to 257,600.

Week ending February 20, 221,800,
Week ending February 27, 223,100,
Week ending March 6, 267,700,
Week ending March 13, 239,900,
Week ending March 20, 204,000,
Week ending March 27, 158,000,
Week ending April 3, 142,000,
April 10, 24,000,
April 17, 9,000,
April 24, 2,500,
May 1, 125,000,
May 8, 4,000,
May 15, 4,000,
May 22, 4,000,

May 29, 9,500,
June 5, 6,500,
June 12, 1,600,
June 19, 3,100,
June 26, 2,500,
July 3, 1,700,
July 10, 1,500,
July 17, 11,500,
563 July 24, 1,800,
July 31, 9,000,
August 7, 14,000,
August 14, 12,500,
August 21, 15,000,
August 28, 26,000,
September 4, 30,000,
September 11, 7,500,
September 18, 3,000,
September 25, 3,000,
October 2, 16,500,

Now that represents graphically the bacteria per cubic centimeter shown weekly from the bacterial contents of samples collected daily, and weekly averages made of water collected daily in the Illinois River at Grafton.

Q. MR. JEFFRIES: Take the Mississippi River now at Grafton and describe the weekly average of bacteria per cubic centimeter as shown by the chart or the exhibit.

ATTORNEY GENERAL CROW: In the first place, though, this test was made in the same manner as the other one that you have described, weekly from averages?

A. Yes.

Q. An average made from the daily examinations?

A. Yes.

Q. Just state how you obtained that, just in order to get that method into the record, explain it to Judge Springer.

564 A. From samples taken daily the bacterial contents was obtained, and at the end of the week these numbers of bacteria were added together and an average obtained, which gives the weekly estimation of the number of bacteria per cubic centimeter, and that is here recorded graphically upon the chart

already identified. For Mississippi River two miles above Grafton.

Q. How are the increases indicated? How the increases in the number of bacteria and the decreases, indicated by the lines on the map?

A. This is what is known as a profile map, and it is marked so that every line running horizontally across it represents 500 bacteria per cubic centimeter, beginning with zero it runs to 200,000. Perpendicularly along the front of this profile paper on the left hand side the numbers from zero to 200,000 are written. On every other line where the number of bacteria per week averaged more than 200,000, the figures are written in at the top.

Q. On the white margin? A. Yes, on the white margin, while below the white margin is written the week beginning with January 23 and continuing weekly to October 9.

Q. State how the variations in the number of bacteria are indicated on the surface of the paper by the lines?

A. Now there are horizontal lines on this paper also, and in the space between the horizontal lines at the number of bacteria, is drawn a line in black ink across that space, which
565 indicates the beginning and ending of that week. Now
black lines perpendicularly, connect the weeks, so that the numbers are easily read from that, reading across on the horizontal line, and the number on the left margin of the chart.

Q. Where is the next point located on that chart?

A. The next point on this chart is Mississippi River two miles above Grafton.

Q. Above Grafton?

A. Yes sir, above Grafton. In the week beginning January 23 and ending January 30, 40,500,—

Q. Now these figures indicate the average number weekly per cubic centimeter of water?

A. Yes sir, the average of the numbers collected daily.

February 6, 46,000,
February 13, 43,000,
February 20, 161,000,
February 27, 105,500,
March 6, 55,000,
March 13, 125,000,

March 27, 437,700,
April 3, 142,500,
April 10, 17,500,
April 17, 69,500,
April 24, 18,500,
May 1, 11,000,
May 8, 2,500,
566 May 15, 7,000,
May 22, 6,000,
May 29, 6,000,
June 5, 5,500,
June 12, 6,500,
June 19, 20,000,
June 26, 12,000,
July 3, 12,500,
July 10, 24,500,
July 17, 8,500,
July 24, 11,500,
July 31, 20,000,
August 7, 12,500,
August 14, 17,500,
August 21, 37,500,
August 28, 32,500,
September 4, 17,000,
September 11, 7,500,
September 18, 8,000,
September 25, 14,500,
October 2, 19.500.

Q. What is the next point at which these examinations were made?

A. Mississippi River at Alton.

Q. Alton, Illinois?

567 A. Alton, Illinois, yes. Each of the green squares on this chart, the lines running horizontally, reading upward represent 25,000 bacteria per cubic centimeter.

Q. Go ahead with the next.

A. Beginning with the week of January 23, ending January 30, 119,000,

February 6, 116,000,
February 13, 100,500,

February 20, 296,000,
February 27, 249,600,
March 6, 156,500,
March 13, 214,900,
March 20, 312,300,
March 27, 151,000,
April 3, 88,000,
April 10, 52,000,
April 17, 21,000,
April 24, 7,000,
May 1, 5,000,
May 8, 5,500,
May 15, 8,500,
May 22, 11,000,
May 29, 6,500,
June 5, 12,500,
June 12, 9,000,
June 19, 5,500,
June 26, 6,000,
568 July 3, 3,000,
July 10, 3,000,
July 17, 19,000,
July 24, 5,000,
July 31, 2,000,
August 7, 1,000,
August 14, 2,000,
August 21, 3,000,
August 28, 7,000,
September 4, 2,000,
September 11, 1,000,
September 18, 2,000,
September 25, ,4,000,
October 2, 2,000.

Now, the Mississippi River at Hartford, Illinois.

Q. ATTORNEY GENERAL CROW: Where is Hartford?

A. Hartford is 7 miles below Alton and one mile above the point of union of the Missouri River and the Mississippi River, —one mile about the mouth of the Missouri River.

Q. Now go ahead with the results of that.

A. Beginning January 23 and ending January 30, 87,500.
February 6, 147,000,
February 13, 106,500,
February 20, 233,500,
February 27, 266,900,
March 6, 193,000,
March 13, 209,000,
569 March 20, 320,500,
March 27, 227,600,
April 3, 60,500,
April 10, 58,000,
April 17, 34,000,
April 24, 13,000,

September 25, 26,000,
October 2, 24,000.

Q. Now, give us the next point?

A. Missouri shore, Chain of Rocks—beginning January

23—that is, samples were taken about 300 yards from the Missouri shore in the cross-section of the stream about 100 yards up the river in front of the intake of the St. Louis waterworks, and that is weekly averages—these weekly averages are of the bacterial contents of samples taken daily at this point.

Q. Well, have you got the figures there?

A. Yes, sir. Now, for the week beginning January 23,
572 1900, 240,000.
January 30, 142,500,
February 6, 57,000,
February 13, 99,000,
February 20, 77,000,
February 27, 50,500,
March 6, 177,500,
March 13, 484,800,
March 20, 314,800,
March 27, 70,000,
April 3, 75,500,

573 July 24, 17,000,
July 31, 10,000,
August 7, 6,500,
August 14, 10,000,
August 21, 10,000,
August 28, 10,500,
September 4, 12,000,

September 11, 5,500,
September 18, 24,000,
September 25, 30,500,
October 2, 23,500.

Q. MR. JEFFRIES: Where do we go next?

A. Illinois shore, Chain of Rocks—week beginning January 23, 1900—155,500.
January 30, 76,500,
February 6, 106,000,
February 13, 224,400,
February 20, 190,500,
February 27, 77,500,
March 6, 174,000,
March 13, 345,300,
March 20, 253,800,
March 27, 76,000,
April 3, 47,500,
April 10, 37,000,
April 17, 15,000,
574 April 24, 9,000,
May 1, 3,000,
May 8, 21,000,
May 15, 24,000,
May 22, 9,000,
May 29, 20,000,
June 5, 26,000,
June 12, 22,500,
June 19, 20,500,
June 26, 10,500,
July 3, 10,500,
July 10, 7,500,
July 17, 7,000,
July 24, 4,500,
July 31, 4,500,
August 7, 4,500,
August 14, 5,500,
August 21, 3,500,
August 28, 5,500,
September 4, 2,000,
September 11, 1,500,

September 18, 4,500,
September 25, 12,500,
October 2, 6,000.

575 The next sample is taken at the In-take tower, Chain of Rocks, in the river about one hundred feet in front of the tower, up the river.

Beginning week of January 23, 154,000,
January 30, 135,000,
February 6, 75,000,
February 13, 133,500,
February 20, 112,500,
February 27, 53,000,
March 6, 177,000,
March 13, 200,000,
March 20, 200,000,
March 27, 118,000,
April 3, 90,000,
April 10, 37,000,
April 17, 12,000,
April 24, 7,000,
May 1, 23,500,
May 8, 13,500,
May 15, 4,000,
May 22, 16,500,
May 29, 23,500,
June 5, 26,500,
June 12, 26,000,
June 19, 17,000,
July 3, 13,000,
576 July 10, 14,000,
July 17, 19,000,
July 24, 13,000,
July 31, 7,000,
August 7, 4,500,
August 14, 5,500,
August 21, 6,000,
August 28, 14,000,
September 4, 6,000,
September 11, 4,500,
September 18, 30,500,

September 25, 25,500,
October 2, 16,500.

The next sample was taken at outlet chamber, reservoir, at the Chain of Rocks.

Q. MR. JEFFRIES: That is as the water goes out of the reservoir into the conduit?

A. As the water comes out of the reservoir into the conduit which carries the water over to Baden, leading into the conduit at Bissell's Point, from the reservoir.

The first date is January 23, 28,000,
January 30, 110,000,
February 6, 31,000,
February 13, 42,000,
February 20, 106,500,
February 27, 53,000,
577 March 6, 70,000,
March 13, 200,000,
March 20, 2000,000,
March 27, 76,500,
April 3, 85,500,
April 10, 35,500,
April 17, 3,500,
April 24, 10,500,

August 28, 3,500,
578 September 4, 3,000,
September 11, 1,500,
September 18, 3,000,
September 25, 3,500,
October 2, 3,000.

Now, the next samples were collected in the tap in the bacteriological laboratory at the Old City Hall, corner Eleventh and Chestnut streets, beginning May 8 and continuing to October 2, 1900.

Week beginning May 8, 10,000,
May 15, 3,500,
May 22, 3,500,
May 29, 2,000,
June 5, 2,000,
June 12, 1,500,
June 19, 1,500,
June 26, 1,000,
July 3, 1,000,
July 10, 500,
July 17, 500,
July 24, 1,000,
July 31, 1,000,
August 7, 1,000,
August 14, 1,000,
August 21, 1,000,
August 28, 500,
September 4, 1,000,
579 September 11, 500,
September 18, 1,000,
September 25, 1,500,
October 2, 1,500,

That is all of it.

ATTORNEY-GENERAL CROW: We want to offer this map as an exhibit.

MR. SPRINGER: We have no objection.

Map received in evidence and marked "Complainant's Exhibit No. 1, Frank S. Bright, Commissioner."

Adjourned until 10:00 o'clock following morning, Tuesday, February 24, 1903, at same place.

Southern Hotel, St. Louis, Missouri. 10:00 a. m., Febru-
580 ary 24, 1903. Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD

Resumed the stand for further direct examination by Mr. Jeffries, and testified as follows:

MR. JEFFRIES: Now this map I speak of is the same map we introduced the last thing yesterday afternoon, it being numbered Complainant's Exhibit 1.

Q. Now, Doctor Ravold, I will get you to take that chart and explain what that shows with reference to the numbers of bacteria in the waters of the Illinois, Mississippi and the Missouri rivers at the various points and times designated on the map and what it shows, if anything, with reference to the commingling of the waters of the Illinois and the Mississippi and the waters of the Mississippi and Missouri after the Illinois and Mississippi have commingled, and how those facts are indicated by the lines and marks on this map marked Complainant's Exhibit 1.

A. Now what this chart shows is what I have already explained.

Q. (Question repeated.)

A. You want a description of this chart?

581 Q. Yes?

A. This chart shows the bacteria per cubic centimeter. The numbers recorded perpendicularly along the profile lines. The weekly averages have been obtained by adding the bacterial contents, obtained from samples collected daily, dividing by seven, which gives the weekly averages. These weekly averages are recorded, beginning January 23rd, and ending October 9, 1900. Now what do you want?

Q. Answer that question; what those facts are. Explain what those lines indicate, how indicated and the facts called for in the question.

A. These weekly numbers of bacteria are recorded for the Illinois river at Grafton, Illinois; the Mississippi river at Grafton, Illinois; the Mississippi river at Alton one mile above the town; the Mississippi river at Hartford seven miles below Alton;

the Missouri river at Fort Bellefontaine; the Missouri shore, Chain of Rocks; the Illinois shore, Chain of Rocks; the tap, bacteriological laboratory old City Hall, beginning May 8th and ending October 9th.

Q. You haven't answered all my question. Just bear that question in mind. You only answered the first part of it.

A. What is the rest of it?

Q. (Question repeated.)

MR. JEFFRIES: I undertook to put it all in one so that 582 you could go right ahead.

A. In order to answer the second part of that question, we will have to make a comparative estimate beginning with the weekly averages at Grafton from January 23rd to 30th and compare it with each one of these elevations upon this chart for the individual stations where the samples were collected.

Q. Well, have you got the data on that map to do that?

A. The data is right there, yes sir.

Q. Go ahead and do it.

A. For the week beginning January 23rd:

Number of bacteria found at Grafton:
Illinois, Illinois river, 116,000,
Missouri river, Grafton, 41,000,
Mississippi river at Alton, 120,000,
Mississippi river, Hartford, 88,000,
Missouri river, Bellefontaine, 213,000,
Missouri shore, Chain of Rocks, 240,000,
Illinois shore, Chain of Rocks, 155,000,
Intake, 154,000,

583 Week beginning January 30th:
Number of bacteria found at Grafton:
Illinois, Illinois river, 189,500,
Mississippi river, Grafton, 46,000,
Mississippi river at Alton, 115,000,
Mississippi river at Hartford, 147,000,
Missouri river at Fort Bellefontaine, 141,000,
Missouri shore, Chain of Rocks, 147,000,
Illinois shore, Chain of Rocks, 76,000,
Intake, Chain of Rocks, 135,000,

Week beginning February 6th:
Number of bacteria found at Grafton:
Illinois, Illinois river, 257,600,
Mississippi river, Grafton, 43,000,
Mississippi river at Alton, 100,000,
Mississippi river at Hartford, 106,500,
Missouri river, Fort Bellefontaine, 63,000,
Missouri shore, Chain of rocks, 58,000,
Illinois shore, Chain of Rocks, 106,000,
Intake, 75,000,

Week beginning February 13th:
Illinois River at Grafton, 221,800,
584 Mississippi River at Grafton, 161,000,
Mississippi River at Alton, 296,000,
Mississippi River at Hartford, 233,000,
Missouri River, Ft. Bellefontaine, 52,000,
Missouri Shore, Chain of Rocks, 98,000,
Illinois shore, Chain of Rocks, 224,400,
Intake, 133,500.

Week beginning February 20th:
Illinois River at Grafton, 221,800,
Mississippi River at Grafton, 105,500,
Mississippi River at Alton, 249,600,
Mississippi River at Hartford, 266,700,
Missouri River, Ft. Bellefontaine, 70,000,
Missouri shore, Chain of Rocks, 77,000,
Illinois shore, chain of rocks, 192,000,
Intake, 112,000.

Week beginning February 27th:
Illinois River at Grafton, 223,100,
585 Mississippi River at Grafton, 55,000,
Mississippi River at Alton, 156,500,
Mississippi River at Hartford, 193,000,
Missouri River, Ft. Bellefontaine, 63,000,
Missouri Shore, chain of rocks, 50,500,
Illinois Shore, Chain of Rocks, 77,000,
Intake, 53,000.

Week beginning March 6th:
Illinois River at Grafton, 267,700,
Mississippi River at Grafton, 125,000,
Mississippi River at Alton, 214,900,
Mississippi River at Hartford, 209,200,
Missouri River, Ft. Bellefontaine, 176,000,
Missouri Shore, Chain of Rocks, 177,000,
Illinois shore, Chain of Rocks, 174,500,
Intake, 177,000.

Week beginning March 13th:
Illinois River at Grafton, 276,700,
586 Mississippi River at Grafton, 490,200,
Mississippi River at Alton, 312,300,
Mississippi River at Hartford, 320,500,
Missouri River, Ft. Bellefontaine, 435,500,
Missouri Shore, Chain of Rocks, 484,800,
Illinois Shore, Chain of Rocks, 374,300,
Intake, 484,900.

Week beginning March 20th:
Illinois River at Grafton, 204,300,
Mississippi River at Grafton, 433,700,
Mississippi River at Alton, 156,000,
Mississippi River at Hartford, 227,600,
Missouri River at Ft. Bellefontaine, 271,500,
Missouri Shore, Chain of Rocks, 314,800,
Illinois Shore, Chain of Rocks, 253,800,
Intake, 511,800.

Week beginning March 27th:
Illinois River at Grafton, 158,500,
587 Mississippi River at Grafton, 142,000,
Mississippi River at Alton, 90,000,
Mississippi River at Hartford, 60,500,
Missouri River, Bellefontaine, 139,000,
Missouri Shore, Chain of Rocks, 70,000,
Illinois shore, Chain of Rocks, 76,000,
Intake, 118,500.

Week beginning April 3rd:
Illinois River at Grafton, 142,500,
Mississippi River at Grafton, 37,500,
Mississippi River at Alton, 59,500,
Mississippi River at Hartford, 58,000,
Missouri River, Ft. Bellefontaine, 140,000,
Missouri shore, Chain of Rocks, 76,000,
Illinois shore, Chain of Rocks, 47,500,
Intake, 118,000.

Week beginnig April 10th:
Illinois River at Grafton, 24,000,
588 Mississippi River at Grafton, 69,000,
Mississippi River at Alton, 23,500,
Mississippi River, Hartford, 34,000,
Missouri River, Ft. Bellefontaine, 66,000,
Missouri Shore, chain of rocks, 62,500,
Illinois Shore, Chain of Rocks, 37,000,
Intake, 90,000.

Week beginning April 17th:
Illinois River at Grafton, 9,000,
Mississippi River at Grafton, 18,500,
Mississippi River at Alton, 9,500,
Mississippi River at Hartford, 16,000,
Missouri River, Ft. Bellefontaine, 49,000,
Missouri Shore, Chain of Rocks, 21,000,
Illinois Shore, Chain of Rocks, 14,500,
Intake, 37,000.

Week beginning April 24th:
Illinois River at Grafton, 2,500,
589 Mississippi River at Grafton, 11,000,
Mississippi River at Alton, 10,000,
Mississippi River at Hartford, 7,500,
Missouri River, Ft. Bellefontaine, 49,000,
Missouri shore, Chain of Rocks, 11,500,
Illinois shore, chain of rocks, 9,000,
Intake, 12,000.

Week beginning May 1st:
Illinois River at Grafton, 2,500,
Mississippi River at Grafton, 2,000,
Mississippi River at Alton, 7,000,
Mississippi River at Hartford, 11,500,
Missouri River, Ft. Bellefontaine, 16,500,
Missouri shore, Chain of Rocks, 10,500,
Illinois shore, Chain of Rocks, 2,500,
Intake, 7,000.

Week beginning May 8th:
Illinois River at Grafton, 12,500,
590 Mississippi River at Grafton, 7,000,
Mississippi River at Alton, 13,500,
Mississippi River at Hartford, 15,500,
Missouri River, Ft. Bellefontaine, 22,000,
Missouri Shore, Chain of Rocks, 46,000,
Illinois Shore, Chain of Rocks, 21,500,
Intake, 23,500.

Week beginning May 15th:
Illinois River, Grafton, 6,000,
Mississippi River, Grafton, 6,500,
Mississippi River at Alton, 16,000,
Mississippi River at Hartford, 18,000,
Missouri River, Ft. Bellefontaine, 45,500,
Missouri Shore, Chain of Rocks, 43,000,
Illinois Shore, Chain of Rocks, 24,000,
Intake, 13,500.

Week beginning May 22nd:
Illinois River at Grafton, 6,000,
591 Mississippi River at Grafton, 6,500,
Mississippi River at Alton, 8,000,
Mississippi River at Hartford, 6,000,
Missouri River, Ft. Bellefontaine, 40,500,
Missouri Shore, Chain of Rocks, 29,500,
Illinois Shore, Chain of Rocks, 9,000,
Intake, 4,000.

Week beginning May 29th:
Illinois River at Grafton, 9,500,
Mississippi River at Grafton, 5,500,
Mississippi River at Alton, 7,000,
Mississippi River at Hartford, 8,000,
Missouri River at Ft. Bellefontaine, 52,000,
Missouri Shore, Chain of Rocks, 25,000,
Illinois Shore, Chain of Rocks, 20,000,
Intake, 17,000.

Week beginning June 5th:
Illinois River at Grafton, 6,500,
592 Mississippi River at Grafton, 7,000,
Mississippi River at Alton, 12,500,
Mississippi River at Hartford, 6,000,
Missouri River at Ft. Bellefontaine, 55,500,
Missouri Shore, Chain of Rocks, 22,500,
Illinois Shore, Chain of Rocks, 26,000,
Intake, 23,500.

Week beginning June 12th:
Illinois River at Grafton, 16,000,
Mississippi River at Grafton, 20,000,
Mississippi River at Alton, 9,000,
Mississippi River at Hartford, 5,000,
Missouri River at Ft. Bellefontaine, 63,500,
Missouri Shore, Chain of Rocks, 38,500,
Illinois Shore, Chain of Rocks, 21,500,
Intake, 26,500.

Week beginnig June 19th:
Illinois River at Grafton, 31,000,
593 Mississippi River at Grafton, 12,000,
Mississippi River at Alton, 5,500,
Mississippi River at Hartford, 5,000,
Missouri River at Ft. Bellefontaine, 112,500,
Missouri shore, Chain of Rocks, 38,500,
Illinois shore, Chain of Rocks, 20,500,
Intake, 17,500.

Week beginning June 26th:
Illinois River at Grafton, 6,500,
Mississippi River at Grafton, 14,500,
Mississippi River at Alton, 6,000,
Mississippi River at Hartford, 4,500,
Missouri River, Ft. Bellefontaine, 105,500,
Missouri Shore, Chain of Rocks, 17,000,
Illinois Shore, Chain of Rocks, 10,500,
Intake, 13,000.

Week beginning July 3rd:
Illinois River at Grafton, Illinois, 17,000,
594 Mississippi River at Grafton, 15,500,
Mississippi River at Alton, 3,500,
Mississippi River at Hartford, 3,500,
Missouri River at Ft. Bellefontaine, 29,500,
Missouri Shore, Chain of Rocks, 1,000,
Illinois Shore, Chain of Rocks, 10,500,
Intake, 14,000.

Week beginning July 10th:
Illinois River at Grafton, 15,000,
Mississippi River at Grafton, 24,000,
Mississippi River at Alton, 3,500,
Mississippi River at Hartford, 7,000,
Missouri River, Ft. Bellefontaine, 27,500,
Missouri shore, Chain of Rocks, 20,500,
Illinois shore, Chain of Rocks, 8,000,
Intake, 19,000.

Week beginning July 17th:
Illinois River at Grafton, 11,500,
595 Mississippi River, Grafton, 9,000,
Mississippi River, at Alton, 18,000,
Mississippi River at Hartford, 4,000,
Missouri River at Ft. Bellefontaine, 21,000,
Missouri Shore, Chain of Rocks, 17,500,
Illinois Shore, Chain of Rocks, 7,500,
Intake, 13,000.

Week beginning July 24th:
Illinois River at Grafton, 18,000,
Mississippi River at Grafton, 12,000,
Mississippi River at Alton, 5,000,
Mississippi River at Hartford, 3,000,
Missouri River, Ft. Bellefontaine, 10,500,
Missouri Shore, Chain of Rocks, 10,000,
Illinois Shore Chain of Rocks, 4,500,
Intake, 7,000.

Week beginning July 31st:
Illinois River at Grafton, 9,000,
596 Mississippi River at Grafton, 20,000,
Mississippi River at Alton, 2,500,
Mississippi River at Hartford, 1,500,
Missouri River at Ft. Bellefontaine, 10,500,
Missouri shore, Chain of Rocks, 6,500,
Illinois shore, Chain of Rocks, 5,000,
Intake, 4,500.

Week beginning August 7th:
Illinois River at Grafton, 14,000,
Mississippi River at Grafton, 12,500,
Mississippi River at Alton, 1,000,
Mississippi River at Hartford, 1,500,
Missouri River at Ft. Bellefontaine, 7,000,
Missouri shore, Chain of Rocks, 10,000,
Illinois shore, Chain of Rocks, 4,500,
Intake, 8,500.

ADJOURNED until 2:00 P. M., same day, February 24th, 1903. Southern Hotel, St. Louis.

Southern Hotel, St. Louis, Missouri.
597 2:00 P. M., Tuesday, February 24, 1903.
Continuation after recess.

Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD,

resumed the stand for further direct examination by Attorney-General Crow, and testified as follows:

Q. Go ahead doctor.

A. Week beginning August 14:
Illinois River at Grafton, 12,500,
Mississippi River at Grafton, 18,000,
Mississippi River at Alton, 2,000,
Mississippi River at Hartford, 2,000,
Missouri River, Ft. Bellefontaine, 5,500,
Missouri shore, Chain of Rocks, 10,000,
Illinois shore, Chain of Rocks, 5,500,
Intake, 6,500.

Week beginning August 21:
Illinois River at Grafton, 15,500,
Mississippi River at Grafton, 36,500,
Mississippi River at Alton, 3,000,
Mississippi River at Hartford, 3,500,
Missouri River, Ft. Bellefontaine, 14,000,
Missouri shore, chain of rocks, 10,500,
598 Illinois shore at Chain of Rocks, 3,500,
Intake, 14,000.

Week beginning August 28:
Illinois River at Grafton, 26,500,
Mississippi River at Grafton, 32,000,
Mississippi River at Alton, 7,000,
Mississippi River at Hartford, 3,500,
Missouri River, Ft. Bellefontaine, 12,500,
Missouri Shore, Chain of Rocks, 12,000,
Illinois Shore, chain of rocks, 8,500,
Intake, 6,500.

Week beginning September 4:
Illinois River at Grafton, 29,000,
Mississippi River at Grafton, 17,000,
Mississippi River at Alton, 1,500,
Mississippi River at Hartford, 2,500,

Missouri River, Ft. Bellefontaine, 6,500,
Missouri Shore at Chain of Rocks, 5,500,
Illinois Shore at Chain of Rocks, 2,000,
Intake, 4,500.

Week beginning September 11:
Illinois River at Grafton, 7,500,
Mississippi River at Grafton, 8,000,
Mississippi River at Alton, 1,000,
Mississippi River at Hartford, 1,000,
Missouri River, Ft. Bellefontaine, 40,500,
599 Missouri Shore at Chain of Rocks, 24,000,
Illinois Shore at Chain of Rocks, 1,500,
Intake, 30,500.

Week beginning September 18:
Illinois River at Grafton, 3,000,
Mississippi River at Grafton, 8,500,
Mississippi River at Alton, 2,000,
Mississippi River at Hartford, 2,500,
Missouri River, Ft. Bellefontaine, 36,000,
Missouri Shore, Chain of Rocks, 30,500,
Illinois Shore, Chain of Rocks, 8,000,
Intake, 25,500.

Week beginning September 25:
Illinois River at Grafton, 3,000,
Mississippi River at Grafton, 14,500,
Mississippi River at Alton, 4,000,
Mississippi River at Hartford, 4,000,
Missouri River, Ft. Bellefontaine, 36,000,
Missouri Shore, Chain of Rocks, 30,000,
Illinois Shore, Chain of Rocks, 13,000,
Intake, 25,500.

Week beginning October 2:
Illinois River at Grafton, Ill., 16,500,
Mississippi River at Grafton, 20,500,
Mississippi River at Alton, 2,000,
Mississippi River at Hartford, 2,500,
600 Missouri River at Ft. Bellefontaine, 24,000,

Missouri Shore, Chain of Rocks, 23,500,
Illinois Shore, Chain of Rocks, 6,000,
Intake, 17,000.

Q. ATTORNEY GENERAL CROW: Doctor, that is all of that, is it?

A. That is all of that, yes sir.

Q. I will ask you if there is anything on this map that indicates that the water of the Mississippi and Illinois Rivers —that the water of the Illinois River come into it, and if so at what point?

A. We have two points on the Mississippi River,—at Alton, and at Hartford, and as far as can be ascertained from the bacterial contents of the stream taken in the center of the river, we show a mixture both at Alton and at Hartford, with this chart, of the waters of the two rivers.

Q. That is of the Illinois and the Mississippi?

A. Of the Illinois and the Mississippi, yes,—that is in the channel now.

Q. Now is there anything in this chart, and if so, what is it, that indicates the commingling of the waters of the Mississippi and the Missouri, after the Illinois has flown into the Mississippi?

A. Yes sir. This is a comparative estimate of the numbers of bacteria in the waters,—that is, of a cross-section of the Mississippi river, Missouri shore, Intake,—Illinois shore as can be seen on this chart, which shows that quite often there
601 is an intimate mixture at the Intake of the waters of the
3 rivers, that is bacteriologically, as is indicated on the two sides of the Intake.

Q. I will get you to state, if you know, whether or not the waters of the Mississippi River and the Missouri River, commingle at the Intake?

A. Yes sir, at times they do markedly,—that is estimating by the number of bacteria.

Q. Well, what I mean to ask you is, if from a bacteriological examination of the water, whether or not the result of that would lead you to believe, as an expert, that there is a commingling of those waters at the Intake?

A. You don't wish this for any specified period, do you? Yes.

Q. I will ask you this question; Are you familiar with the stage of the Missouri and the Mississippi and the Illinois River at the time covered by this chart?

A. Yes sir.

Q. Beginning the 23rd of January, 1900, and ending October 9, 1900?

A. Yes sir.

Q. Now I will ask you to state what were the different stages of the river, that is to say, I don't mean the government stages of the water, actual water, but the conditions as to high or low or ordinary stage, if you are able to tell from your knowledge of these rivers, what would be the different stages?

602 A. Well, I have the official figures of the Government, and the meteriological department, and I have also the numbers of bacteria graphically demonstrated in curves on a series of charts. I know this—

Q. Where are those charts?

A. They are here. I know that at a certain time,—from memory, I remember this, that the Illinois River for instance, was high in—say February 12 to 20, 1900. I know that the Mississippi River was covered with ice at the time and it was low, comparatively speaking. I know that the Missouri River was covered with ice at the time, and was comparatively low. In fact I know that at this period a thaw occurred in the whole Illinois River valley, and the Illinois river was swept out.

Q. In what period?

A. The period mentioned.

Q. In February, 1900?

A. Yes sir.

Q. Now at what stages were these various rivers, the Illinois, the Missouri and the Mississippi, during the spring and summer and autumn?

A. I don't remember the definite periods of time, but after the date mentioned, beginning in the middle of February and running up to quite a long time,—a couple of months,—two or three months, all the rivers were high. The spring freshets occurred then. That is when the bacteria appear in such enormous numbers, in all rivers.

603 Q. Do you know whether or not the flushing of streams by the rains and floods has any effect on diminishing or increasing the number of bacteria in the channels of the rivers?

A. It increases it markedly.

Q. Do you know the flood tide of the Missouri river—at what period of the year it is?

A. I know there are generally two periods of rise; there is the spring rise and then the flooding of the river with the thawing of the ice on the mountains, which generally is in June.

Q. What period usually does the spring rise occur in the river?

A. As soon as the thaws and rains of spring begin. That may be more or less late; it may begin in February, or it may not begin until the latter part of March, depending on the weather entirely.

Q. Do you know anything about the flood tides of the Mississippi, as to what period it is highest?

A. Yes, either in the spring—

Q. In the spring?

A. Yes sir. If there should be heavy rains in June there would also be a rise then.

Q. Do you know anything about its period of being at flood tide above the Missouri river, the confluence of the two streams?

A. I know that when those two streams are high, either 604 one of them, the Mississippi river above the mouth of the Intake is high, the flood volume—I don't know at this time, from memory, but by taking the reports of the Mississippi river survey and the Missouri river survey commission—

Q. Do you know from your bacteriological examination of the water and your personal observation, that you have made in it, at what period of time as shown by that chart, the most of the water from the Mississippi river came into the Intake of the St. Louis waterworks?

A. I cannot state that from memory; I can state it from the charts, and I also have that information on another chart, showing as I say, by projected curves—

Q. Does it show at what time it appears, on that chart?

A. It shows markedly in a rise. It shows on this chart of the Illinois river, for the week beginning February 13, there was a very high rise in the Illinois river which extends to the week beginning March 27. February 13 to March 27.

MR. DRENNAN: Six weeks?

A. Yes sir.

ATTORNEY-GENERAL CROW: Now during that period of time does that bacteriological examination disclose to you, as a bacteriologist, that the water from the Illinois and Mississippi rivers was coming into the Intake tower?

A. Yes sir.

Q. At St. Louis waterworks?

A. Yes sir. Here is the period of time at which the
605 Illinois river was flushed. I call attention especially to the dates beginning in the week of February 13, and say extending to the week beginning February 20, during which time the numbers of bacteria in the Illinois river at Grafton, were 257,600 and 221,800 respectively, for those two weeks.

The Mississippi river at that time was covered with ice, and the river fairly high. For the week beginning February 6, the number of bacteria in the Mississippi river at Grafton was 46,000, and the week ending February 13, the number of bacteria was 161,000. For the week February 20, at Grafton, Mississippi river, it was 105,500; week beginning February 27, 55,000. Now if you will give me those dates, I will give you the numbers at Grafton, Illinois.

Week beginning February 6, 109,000,
" February 13, 257,600,
" February 20, 221,800,
" February 27, 223,100.

I will give you the same thing from Alton, just to show you that there is a mixture in the channel there.

February 6, at Alton, Mississippi river, 100,500.
February 13, 296,000,
February 20, 249,000,
February 27, 157,000.

Mississippi river at Hartford, week beginning February 6, 106,500,
Week beginning February 13, 233,100,
606 Week beginning February 20, 266,700,
Week beginning February 27, 142,500.

Now then, we will go over to the Missouri river.

MR. DRENNAN: You are now giving the high stages?

A. I am giving the bacteria per cubic centimeter for weekly averages, taking a definite period of time, and I show you by the river stages that the Illinois river was high at this particular time and contained enormous numbers of bacteria; that these other rivers were covered with ice, and were low in bacteria. I want to show mixture of the Illinois and Mississippi rivers at St. Louis, Missouri:

Ft. Bellefontaine, February 6, 63,000,
Week ending February 13, 52,500,
Week ending February 20, 69,500,
Week ending February 27, 63,500.

Now that is the Missouri river at Fort Bellefontaine, at those dates.

Now beginning February 6, on the Missouri shore, Chain of Rocks, it was 58,000.

Week beginning February 13, 99,000,
Week beginning February 20, 77,500,
Week beginning February 27, 50,500.

Illinois shore, Chain of Rocks:

Week beginning February 6, 106,000,
Week beginning February 13, 224,400,
Week beginning February 20, 190,000.

607 Week beginning February 27, we have a drop to 77,500.

Now Intake at these periods:

February 6, 75,000,
Week beginning February 13, 133,500,
Week beginning February 20, 112,000,
Week beginning February, 27, 53,500.

Showing a mixture first of the Illinois and Mississippi rivers at Hartford, and the mixture of the Mississippi river and the Illinois river and the Missouri river at the Intake. This chart shows that.

Q. ATTORNEY-GENERAL CROW: And your examination discloses it?

A. Yes sir.

ATTORNEY-GENERAL HAMLIN: That is on the bacterial proposition?

A. Quantitative determination of the numbers of bacteria. I have made a table of total solids and all that sort of thing, but that doesn't belong to my department. The chemists get a chance at that.

ATTORNEY-GENERAL CROW: Now, Dr. Ravold, what is this chart intended to represent, that I now show you?

A. This chart is made upon cross-section, profile paper, ruled ten times ten to the square inch. This is exhibit number 2, and—

Q. I haven't offered it yet.

A. It is marked, "Results showing mixture of the waters of the Mississippi and the Missouri river at the Intake of the St. Louis waterworks, bacteria per cubic centimeter from
608 weekly estimations."

Q. Now what do the different colored lines on this chart represent?

A. The Illinois shore is marked in black. The bacteria per cubic centimeter. The Intake tower is marked red and the Missouri shore is marked blue.

Q. Now what do the figures on the left hand column indicate?

A. The bacteria per cubic centimeter.

Q. Now please explain the relation, if any, between the figures and the different colored lines in the chart?

A. Well, as I say, the weekly estimations are here marked in black, upon the dates named, in the lower margin of the chart beginning January 23, 1900, and extending through until October 2.

ATTORNEY-GENERAL CROW: Now I will offer this, if you gentlemen have no objection to it I will offer it as complainant's Exhibit Number 2.

JUDGE SPRINGER: We have no objection.

Said chart received in evidence and marked "Complainant's Exhibit No. 2. Frank S. Bright, Commissioner."

Q. ATTORNEY-GENERAL CROW; Now will you explain how you could determine from the number of bacteria and place a corresponding mark on this chart showing when there was a mixture of the waters of the Mississippi and the Missouri rivers?

A. Why, here at almost any date here, we can take any one of these dates.

Q. Well, that is just what I want you to explain, so I
609 can look at the chart and understand the use of it?

A. January 23, we find the number of the bacteria in the Illinois river marked 240,000 here. The number in the Missouri river 155,000.

The number at the Intake between these points—150,000 for these three points. The red is the Intake. The Intake corresponds very closely, as you will notice, with the number in the Missouri river.

When we get to January 30, we find the number of bacteria in the Mississippi river 150,000; the number of the bacteria at the Intake 135,000; the number on the Missouri shore 75,000. Here then we have the Intake standing between those two numbers—not quite midway, but showing more Mississippi river water coming into the Intake containing 135,000, and the Mississippi river 150,000. These figures would indicate that the water at the Intake is more Mississippi river than it is Missouri river water, and so we can go throughout the large map. The Illinois river does not appear on this chart at all, just simply the Mississippi river showing at the Intake; the Missouri shore and the Illinois shore.

Q. Now what is this chart that I show you?

A. This is a chart of the weekly average of the result of quantitative determination of the number of bacteria in samples of water collected daily from the Mississippi river at Grafton, two miles above the town, together with the stages of
610 the river at Missouri shore.

Q. What are the different colors on that map? What do they represent?

A. The red indicates the bacteria per cubic centimeter, and the blue represents the stages of the river.

Q. Those are the only two colors on the chart?

A. Yes sir.

Q. Now what relation, if any, is there between the column of figures on the left hand side of that chart, and the blue and red curved lines?

A. On the left hand side we have the number of bacteria per cubic centimeter, in five thousands, running from zero up to 250,000—the bacteria per cubic centimeter first. Next to that we have a column bearing the stages of the river in feet, running from zero to 25 feet.

Q. Who made that chart?

A. My assistant, Mr. Johnson, made this chart, at my direction.

Q. Was that true of the other chart marked Complainant's Exhibit Number 2?

A. He wrote in the figures, yes.

Now on the upper margin of these figures, is marked the average daily observance for week ending January 30, and extending to October 2.

Q. Observance of what?

611 A. Observations of the average—the daily observance for week beginning—that of bacteria, which is here recorded.

Q. Then of the river stages?

A. And of the river stages.

Q. Now what result, if any, is shown there between the varying stages of the river and the number of bacteria found in a centimeter?

A. Well, as a rule, running through the chart when the river is falling it will be seen that the number of bacteria decreases markedly; when the river is rising the number of bacteria run up to great heights.

Q. Now this chart is made from data gathered at a point above the entry of the Illinois river into the Mississippi river?

A. Yes sir, two miles above Grafton in the Mississippi.

Q. Do you know what was the stage of the Mississippi river at that point at that time with reference to its being high or low or ordinary—the condition of the water?

A. At what particular time?

Q. Well in the period of time covered by that chart?

A. Well from January 30 the stage of the Mississippi river at Louisiana, Missouri, was two feet. I don't know what their gauge is up there, these figures came from there.

JUDGE SPRINGER: Two feet above low water?

A. Two feet above low water I suppose. Then we have

612 it dropping down to low water here on January 30, it tumbled to practically zero at Louisiana on the 30th; then there was a rise of nearly three feet on February 6—a rise to three feet and five-tenths February 13, and on the 20th, a little bit over 3.5 feet. Then it dropped on February 27th to one foot; then a rapid rise to 4.5 feet; then March 13 it reached the eleven foot stage; on the 20th it dropped to 7.5 feet; on the 27th it dropped to 5.5 feet. It rose April 3rd to 7.5 feet. Now this is weekly estimations from daily observations. You see we have daily observations recorded here to show you, taken at Louisiana, Missouri, and we have simply added the different observations together and made this estimation of the weekly average.

April 10, it was 7 feet; April 17, about 7.3 feet; April 24, 7.6 feet; the river is holding itself rather steady at this time. March 1st, about 7.2 feet; March 8th, 7.5 feet. During this stage from April 3 to May 1, when the river held steadily apparently at that stage, the number of bacteria dropped down markedly, showing that when a river steadies itself and is not washing the surface soil—

ATTORNEY-GENERAL CROW: Settling it?

A. Why a great many bacteria disappear.

Q. By settling?

A. No, not by settling. They are not washed into the stream; it simply holds itself steadily, which shows on the chart right straight along. Then there was a steady fall from
613 May 1st to May 8th. Then the river fell on the 15th to five feet; on the 22nd to four and one-half feet; on the 29th to 3.5 feet; June 5, 2.5 feet; June 12, one foot and eight-tenths; a slight rise here on the 19th, 2.5 feet; a fall again on the 26th to two feet. July 3, 1.4 feet; July 10, about 1.1 feet; then a rise again on the 17th to three feet.

July 24, 4.4 feet,
July 31, 4 feet,
August 7, 2.4 feet,
August 14, 2.5 feet,
August 21, 4.4 feet,
August 28, 3.7 feet,
September 4, 3.7 feet,
September 11, 3.2 feet,

September 18, 3.4 feet,
September 25, 5.2 feet,
October 2, 6 feet.

ATTORNEY-GENERAL CROW: I will offer this chart in evidence.

Said chart received in evidence and marked "Complainant's Exhibit 3, Frank S. Bright, Commissioner."

Q. Now what is that chart I hand you?

A. That shows a weekly average of the results of quantitative determination of the number of bacteria in samples of water collected daily from the Mississippi river one mile above Alton, Illinois, together with the height of the Mississippi river at Alton, Illinois.

614 Q. Now just please explain the lines on that chart and what relation they bear to the figures. In the first place, explain who made the chart and from what data?

A. The chart was made from the data collected during this period, January 23 to October 9, 1900.

Q. Under whose supervision?

A. Under my supervision. The determinations were made in the bacteriological laboratory at the Old City Hall, and at the bacteriological laboratory, Medical Department of the Washington University. These figures of stages of the river were obtained from the Government meteorological department. The bacteria per cubic centimeter is arranged perpendicularly, on the left hand margin of the page, beginning at zero and running to 250,000.

Q. And what does the line of figures between the two dark lines indicate?

A. Those figures are marked in red—the bacteria per cubic centimeter; they are perpendicular. Next to that, marked in blue are the stages of the river, running from zero to 25 feet. The figures at the top are per cubic centimeter in one column, and stages of the river in feet in another, and average daily observations for week beginning January 23 to October 2, of bacteria per cubic centimeter.

Q. Now the data from which this chart was made, the material was gathered at a point below the confluence of the

Illinois and the Mississippi river, was it not?

615 A. Below the confluence of the Illinois and Mississippi?

Q. Yes.

A. Yes sir.

Q. That is one mile above Alton?

A. One mile above Alton, yes sir, samples collected from the channel of the river.

Q. Now what, if anything, do these curved blue and red lines indicate and what is their relation to those columns of figures?

A. The curve in red beginning January 23 at 120,000, and rising and falling from that until October 2, indicates the number of bacteria per cubic centimeter, weekly, obtained by adding the daily quantitative determinations, and dividing by seven. That is how the weekly average was obtained and is here recorded.

The blue curved line, beginning January 23, at five feet and so rising and falling, indicates the stage of the river in feet. It is the weekly average from daily observations taken from the chart supplied by the government, and divided by seven, and so this record rises and falls from January 30 to October 2. Do you wish me to read the figures of the rise and fall of the river here?

Q. Well, what generally is the relation between the rise and fall of the river or the river remaining steady, in regard to the number of bacteria found?

616 A. We have, when the river is high, the number of bacteria is high, and when the river rises the number increases with the height, until at the greatest height of the river the greatest number of bacteria are recorded.

Q. At what period of that time was the greatest height of the river reached?

A. The greatest height of the river is reached on March 13, when it was sixteen feet and about 4-10, and the number of bacteria recorded for that week is 312,000 on this chart, per cubic centimeter.

Q. How does that number compare as to being the highest in the period covered?

A. That is the highest at that particular point, at that particular period.

Q. Is there any other point indicated on that chart that is higher than that during that period?

A. No sir, the next highest point is 296,000.

Q. On what date was that?

A. That was on February 13, the week beginning February 13. At that time the river was rising and reached the height of eight feet, steadily rising from the week beginning January 30th—

Q. Until what time?

A. When it was two feet until the week beginning February 20th, that is when it reached eight feet.

617 Q. Was that the highest stage of the river?

A. No sir, the river then fell until it reached 5.6 feet, in the week beginning February 27th.

Q. What occurred then?

A. From that date it rose rapidly—that number then was 5.6; it rose to 16.4 feet, in the week beginning March 13.

Q. And that was the highest point that was reached?

A. That was the highest point that was reached, and the numbers of bacteria, as I said before, reached the enormous number of 312,000. Then the river fell steadily, rising occasionally, and when a rise occurred the number of bacteria increased with it.

Q. Do you know whether or not the Mississippi river at that point was in the average condition for the period of time covered by this table, that it is usually for that period in each recurring year?

A. We can refer to that chart—

Q. You don't know that fact?

A. I can't state it from memory.

Q. All right, just say that you can't state that from memory then, that is all right.

ATTORNEY-GENERAL CROW: I will offer that chart in evidence.

Said chart received in evidence and marked "Complainant's Exhibit 4, Frank S. Bright, Commissioner."

618 Q. Now I will show you a chart and ask you to state what that is, who made it, under whose direction, and where the data was gathered from?

A. This chart was made under my direction. It is the weekly average of results of quantitative determination of the numbers of bacteria found in samples of water collected daily from the Mississippi river at Hartford, Illinois, together with the heights of the Mississippi river at that point.

Q. What period of time is covered by that chart?

A. Beginning January 30, and ending October 9, 1900.

Q. Now I will get you to state where Hartford, Illinois is located with reference to the confluence of the Illinois and Mississippi rivers, and the Intake tower of the St. Louis waterworks?

A. Why, the point of the collection of these samples is in the channel one mile above the mouth of the Missouri river, where it joins the Mississippi river or empties into the Mississippi river, seven miles below Alton, and that is about nine miles above the Intake of the St. Louis Waterworks, Chain of Rocks.

Q. Now please explain what the different markings on that map mean?

A. The figures in red, arranged along the left hand margin of the paper, beginning with zero and being arranged perpendicularly along the edge, to 250,000, represent the number of bacteria, the weekly average number of bacteria 619
per cubic centimeter, made from daily determinations at this point. The figures are in red ink. The stages of river in feet is in the next column and they are marked in blue. At the top margin of the chart are bacteria per cubic centimeter; stage of river in black ink, and then the average of daily observations for week beginning January 23, and ending October 2, 1900.

Q. Well at the top, between the two dark lines, are the dates?

A. The weeks beginning January 23, January 30 and so on, until the week beginning October 2.

Q. Now what relation is there between the red and the blue curved lines?

A. The red lines indicate the curves of bacteria, beginning with the number about 87,000 on January 30, it rises to 147,000, say, in the week beginning January 30, then falls to 105,000 in the week beginning February 6. For the week beginning February 13, the number rises to 232,000 or 233,000. In the week of February 20, they reach the figures 266,700, as shown in the week beginning February 27, they fall to 193,000. On March 6, 208,000 or 209,000, on March 13, they reach the highest number here recorded, 320,500. They then drop steadily in the week beginning March 20, to 226,000.

Week beginning March 27 to 60,000,
Week beginning April 3 to 59,000,
620 Week beginning April 10 to 34,000,
Week beginning April 17, 15,000,

And so rising and falling until the week beginning October 2, when there are less than 5,000.

Q. Now what, if anything, does the bacteriological examination as disclosed by that chart, show with reference to the rise of the waters of the river and the fall of the waters, and the increase or the decrease in the number of bacteria per cubic centimeter, in the water bacteriologically examined?

A. With the rise of the river we find an increased number of bacteria in the water, and with the fall of the river, as a rule we find a decrease in the number of the bacteria; so rising and falling then, as the river rises, beginning at its lowest period, that is here recorded for the week of January 30, at two feet, it rises steadily until February 20, when the height of 7.9 feet is recorded; the number of bacteria at that time being 266,700. The river then drops to 5.6 feet in the week beginning February 27, when the number of bacteria dropped to 193,000 or 194,000, and then the river rises rapidly, in great volume, until the week of March 13th, when 320,500 bacteria are recorded, as the weekly average; then with the fall of the river the bacteria drop very rapidly. The river falls in the week beginning April 27th, to 2.2 feet about. The bacteria in that week fall to 60,000. The
river seems to hold itself steadily here, falling until July
621 10, then there is a slight rise, the bacteria holding them-
selves steadily in the meanwhile, fluctuating between 7,-
000 and about 2,000.

ATTORNEY-GENERAL CROW: I will offer that chart in evidence.

Said chart received in evidence and marked "Complainant's Exhibit No. 5, Frank S. Bright, Commissioner."

Q. Now doctor, what is this chart that I show you?

A. For the year 1900. Chart showing the weekly average of the results of quantitative determination of the numbers of bacteria in samples of water collected at Ft. Bellefontaine, on the Missouri River, together with the height of the river at that point for the weeks beginning January 23, and extending until October 2, 1900.

Q. Now who made that chart?

A. This chart was made under my direction in the bacteriological laboratory.

Q. From what data?

A. From the data collected at this point and the River stages from records obtained at Fort Bellefontaine.

Q. Now explain what the two rows of figures on the left of that chart mean, and the curved lines in blue, and the date lines between the two black lines above the column of figures?

A. On the left hand margin arranged perpendicularly are the bacteria per cubic centimeter, beginning at zero and extending to 250,000, and these figures are in red. The second column contains the stages of the river in feet, ranging from zero
622 —low stage, to 25.5 feet.

The curved lines here, or the curves here marked in red, show the weekly average taken from the daily quantitative determination of the number of bacteria in samples collected at this point, beginning with the week of January 23, the number of bacteria recorded here is about 214,000. After that week the number dropped. In the week of January 30, to 140,000.

In the week beginning February 6th, to about 63,000,

A drop in the week of February 13th, to 54,000,

Week of February 20, a rise to 70,000,

Week of February 27, to 65,000,

Week of March 6th, a rise to 175,000,

Week of March 13, 453,500,—the highest number here recorded for an average.

Q. What date is that?

A. That is week beginning March 13, 1900.

Week beginning March 20, 170,500,

The next week, March 27th, the bacteria tumble to 140,000.
Week of April 3rd, a slight rise to 141,000,
Week of April 10, a fall to 65,000,
Week of April 17, 50,000,
Week of April 24th, 15,000,

623 And then there is a steady rise in May and June up to the week beginning June 26th, when the number of 111,000 is recorded. The next week there is a fall—July 3, 105,000, and in the week of July 10th, to 30,000.

July 17th, 25,000,
July 24th, 20,000,
July 31st, 11,000,
August 7, 11,000,
August 14, 6,000,

August 21st, when the lowest number recorded on this chart is reached,—5,000. Then there is a steady rise until the week of September 18th, when the number 40,000 is recorded; then a fall until the week of October 2, when 24,000 are recorded.

Now the rise and fall of the river is indicated by the curved lines in blue, beginning in the week January 23rd.

MR. DRENNAN: Which river?

ATTORNEY GENERAL CROW: Missouri River at Fort Bellefontaine.

A. Ft. Bellefontaine, on January 23 we have recorded 5 feet. In the week beginning January 30, a drop to 3 feet, and a slight rise February 6th, to 3.5 feet. A steady fall for the week of February 13th,—3 feet. A rise in the week of February 20, to 4.5 feet.

Q. That much of a rise, or it rose to that point?

A. It rose to 4.5 feet.

Q. It is a slight rise?

624 A. A rise of a foot and a half. The river is still rising, February 27, 6 feet are recorded.

March 6th, 13.4 feet.

March 13th, 16 feet, and the number of bacteria recorded is 453,500.

The river falls in the next week to 10.5 feet, and the number of bacteria recorded for that week, beginning March 20, are 271,500.

There is a fall March 27th, to 8.5 feet,
April 3, 9.2 feet,
April 10, 11 feet,
April 17, 11 feet,
April 24, 11.5 feet,
May 1, 11 feet,
May 8, 11 feet,
May 15, 11.4 feet,
May 22, 11.3 feet,
May 29, 11.6 feet,
June 5, 11.2 feet,
June 12, 11.5 feet,
June 19, 11.5 feet,
The river falls steadily now,
June 26, 11.7 feet,
July 3, 11.4 feet,
July 10, 10.5 feet,
July 17, 10 feet,
625 July 24, a rise to 11 feet,
July 31, a fall to 8.5 feet,
August 7, 6.5 feet,
August 14, 6 feet,
August 21, 6.7 feet,
August 28, 8.6 feet,
September 4, 7.9 feet,
September 11, a fall to 5.4 feet,
September 13, 5.5 feet,
September 25, 6.4 feet,
October 2, 9.5 feet.

Q. What relation if any, is there between the rise and fall of the stages of river and the rise and fall of the number of bacteria as shown by this chart at Bellefontaine?

A. When the river is falling the number of bacteria rapidly fall; when the river is rising and in its high stages, it shows enormous numbers of bacteria. When the river steadies itself as it does from April 10 to May 29, the bacteria fall rather steadily.

Q. Now where is Fort Bellefontaine with reference to the confluence of the Missouri and the Mississippi Rivers, and the Intake tower of the St. Louis waterworks?

A. Fort Bellefontaine, where these samples were collected, is six miles above the mouth of the Missouri River, where it discharges into the Mississippi; that would be fourteen miles from the Intake of the St. Louis waterworks, by river.

626 Q. Does this chart disclose bacteriologically at what time there was the greatest number of bacteria in the waters of the Missouri River at Fort Bellefontaine?

A. It does, sir.

Q. During this period?

A. This is the weekly estimation.

Q. What period of time was that?

A. The very highest numbers reached were in the week beginning March 13th, when the number of bacteria reached 453,500,—the stages of the river at that time being 16.1 feet.

ATTORNEY GENERAL CROW: Now I will offer that chart in evidence.

Said chart received in evidence and marked "Complainant's Exhibit 6, Frank S. Bright, Commissioner."

Q. Now what is this that I show you?

A. It is a chart showing the weekly average of the results of the daily determinations of the numbers of bacteria in samples of water collected at the Chain of Rocks, Missouri shore, together with the heights of the Mississippi River at that point.

Q. Well, under whose supervision and from what data was this chart made?

A. It was made under my supervision; it was made from samples collected at this point and examined in the bacteriological laboratories from January 23, 1900, to the week beginning October 2, 1900.

627 On the left hand margin of the map are written in red the bacteria per cubic centimeter beginning at zero and running to 250,000.

In the next column are the stages of the river in feet, beginning at zero and going to 25.5 feet.

Q. Well now, will you please explain what the blue and red lines on this chart mean?

A. The red lines beginning, January 23,—do you want me to say what the column is at the top?

Q. Yes, didn't you put that in?

A. The column at the top of the chart records the daily observations for the weeks beginning January 23, and extending to October 2, for the year 1900.

Now the curved mark in red ink begins January 23, and shows the weekly average of the numbers of bacteria at that point and the number of 240,000 is recorded for the week beginning January 23rd.

Week beginning January 30, 145,000,
do. February 6, 57,000,
do. February 13, 97,000,
do. February 20, 76,000,
do. February 27, 50,000,
do. March 6, 176,000,
do. March 13, 484,800,
do. March 20, 314,000,
do. March 27, 70,000,
do. April 3, 75,000,
628 do. April 10, 62,000,
do. April 17, 21,000,
do. April 24, 10,000,
do. May 1, 10,000,
do. May 8, 50,000,
do. May 15, 47,000,
do. May 22, 34,000,
do. May 29, 30,000,
do. June 5, 20,000,
do. June 12, 41,000,
do. June 19, 44,000,
do. June 26, 21,000,
do. July 3, 21,000,
do. July 10, 14,000,
do. July 17, 20,000,
do. July 24, 15,000,
do. July 31, 10,000,
do. August 7, 10,000,
do. August 14, 10,000,
do. August 21, 10,000,
do. August 28, 11,000,

Week beginning September 4, 12,000,
do. September 11, 5,000,
do. September 18, 24,000.
Week beginning September 25, 30,000,
629 do. October 2, 24,000.

Do you want the stages of the river?

Q. Now what do the blue lines indicate?

A. The blue lines indicate the stages of the river.

Q. Now what connection, if any, is there or relation—what relation is shown between the rise and fall of the number of bacteria in the river, and the stages of the river as it rises and falls during that period?

A. When the river falls the number of bacteria decrease. In high stages and when the river rises, as it does in some cases here, the numbers of bacteria increase enormously.

Q. What reason in bacteriology is assigned for that state of affairs?

A. The rise of rivers is caused by either thawage of snow and ice, upon the drainage area of the river, or rainfall upon it. This means water rushing towards the lowest part of the drainage area, sweeping the surface of the soil of its bacteria and carrying them with the water and debris into the river, and when the river falls and no longer has the bacteria swept into it from the surface washings, the river depends upon springs and sewers for water. That is, these particular rivers. Spring water is a good water and contains very few bacteria, consequently the numbers of bacteria during the falling or low stages of river, are small.

Q. At what period of time does that chart show that the
630 Mississippi River at the Chain of Rocks on the Missouri
shore, was the highest during that period?

A. The highest period reached at that point was in the week beginning March 13th.

Q. 1900?

A. 1900, when the highest number of bacteria are recorded.

Q. What was the stage of the river?

A. 22.5 feet.

Q. And what was the number of bacteria?

A. 484,800.

Q. What is the location of the Chain of Rocks with reference to the Intake tower of the Mississippi River, and the confluence of the Illinois and the Mississippi River and the Missouri River?

A. The Chain of Rocks of the Intake tower is situated or located at the end of the Chain of Rocks, and the Chain of Rocks is built out into the river some fifteen hundred feet, about eight miles above the center of the city,—a line running through Market Street on the river. This point, the Intake, is eight miles below the point where the Missouri River joins with the Mississippi to form the Mississippi River.

Q. Then it is sixteen miles from the foot of Market Street in this city to the confluence of the two rivers, the Mississippi and the Missouri?

A. Yes sir.

Q. Eight miles to the Intake?

631 A. Yes sir.

Q. Now what is the location of the Chain of Rocks with reference to the Intake and what is the Chain of Rocks?

A. The Chain of Rocks, is, as I understand it—it was built by the government some years ago, rocks were dumped into the river—

Q. Is it a dike?

A. It is a dike built out from the shore some—I don't know the exact number of feet, fifteen hundred feet, say, for the purpose of deflecting the river from the shore—

Q. From what shore?

A. From the Missouri Shore.

MR. DRENNAN: It would be called a wing dam, wouldn't it?

A. I am not sure. They call these things dikes, do they not?

MR. JEFFRIES: Well, just describe what it is anyhow; it don't matter what you call it.

ATTORNEY GENERAL HAMLIN: I think it would be well to call someone who knew all about it. It would save time.

THE WITNESS: I have seen these rocks in low water, standing up out of the body of the river.

MR. DRENNAN: It is a wing dam; that's what it is.

A. It is a dike, as I understand it.

Q. ATTORNEY GENERAL CROW: Well, where does it extend from, and to where?

A. It extends from the Missouri shore out into the stream.

632 Q. At what point?

A. Oh, some fifteen hundred feet out.

Q. Whereabouts its it located with reference to the Intake tower of the St. Louis Waterworks?

A. The Intake tower at this point is at the eastern end of that dike or this wing dam, whatever you may call it.

Q. Which is called the Chain of Rocks?

A. Which is called the Chain of Rocks.

Q. That is what I wanted to get into the record, that it was located at that point.

A. Here we have got a name for it,—the Chain of Rocks.

Q. Now what is the lowest stage of the water there on that chart?

A. The lowest stage of the water recorded here is about nine-tenths of a foot.

Q. On what date?

A. On January 30th, in the week beginning January 30, 1900.

Q. Now what is the number of bacteria in that water on that date?

A. 45,000. The bacteria falling, the river had been falling —it had been high previous to that and had been falling. The number of bacteria also at a lower stage below, was 55,000.

ATTORNEY GENERAL CROW: I will offer that chart in evidence.

Said chart received in evidence and marked "Complainant's Exhibit 7, Frank S. Bright, Commissioner."

Q. What is that I show you now?

633 A. This is a chart representing the weekly average results of the quantitative determination of the number of bacteria in samples of water collected daily from the Mississippi River at the Chain of Rocks, Illinois shore, together with the height of the river at that point.

Q. Now from what data was that chart made?

A. Data made from samples collected daily at the Illinois shore, Chain of Rocks, and examinations made in the bacteriological laboratory under my direction, from the week beginning January 23 and ending October 9th, 1900.

Q. Who caused that chart to be made?

A. I did.

Q. Who made it?

A. Mr. Johnson.

Q. Was it made under your direction or supervision?

A. Under my supervision, yes sir.

Q. Do you know whether or not that chart was correctly made from the data collected by you?

A. I think it was sir, yes.

Q. Is that true of the other charts of this series already in evidence, that I have introduced?

A. Yes sir.

Q. Now will you explain the different figures and columns and lines on that chart and what they mean? In the first place, before you do that, locate that point on the Mississippi 634 River. Wait a minute, I can do it quicker this way. At what point was this data got from and what point on the river does this chart represent that refers to the Intake Tower at the Chain of Rocks on the Missouri shore?

A. It is in a direct line of a cross section of the Chain of Rocks, 300 feet from the Illinois shore.

Q. Well then, to speak as a layman would about that matter, it is immediately across the river from the Intake Tower at Chain of Rocks on the Illinois side of the Mississippi River?

A. Yes sir.

Q. Now go ahead please and explain what those marks and lines and figures represent on that chart?

A. On the left hand margin of the chart are written the bacteria per cubic centimeter. In red, beginning with zero and reaching 250,000. In the column next to it are the stages of the river in feet, and the number of feet extending from zero to 25.5 feet, written in blue. On the upper margin is written in a column, the average of daily observations per week beginning January 23 and so on until October 2.

Q. What do those cross lines represent, the red ones, and the blue ones?

A. In red the bacteria per cubic centimeter, connecting the weekly average written in at these points.

Q. The average of what?

A. The weekly average of bacteria from daily quantitative determinations.

Q. What relation, if any, is shown by that chart between
635 the rise and fall of the waters of the river and the increase or the decrease in the number of bacteria in a cubic centimeter of water examined during that period?

A. This chart shows that when the river falls, the bacteria decrease in numbers; when the river rises the bacteria increase, —in some cases, when the river is very high,—to enormous numbers.

Q. What period is shown by the chart at that point, that the stage of the Mississippi was the highest between January 25 and October 9, 1900?

A. This chart shows in the week beginning February 27th the number of bacteria are 772,000.

Q. No, I asked you for the state of the water?

A. The highest stage of the water recorded in this chart is March 13, when the stage of water was 22.6 feet. Do you want the bacteria?

Q. Yes.

A. Per cubic centimeter at that time, weekly determination, 374,000.

Q. At what period was the lowest stage of the water reached?

A. The lowest recorded here was January 30, 1900.

Q. What was the number of bacteria then?

A. The number of bacteria—the river was falling then, it had been high and fell to 75,000.

Q. Now do you know what the fact was as to whether the Mississippi River was frozen over at that point at the time when it was at its highest stage?

A. The river was not frozen over. The river was full of
636 ice floating.

Q. What date did you say was the lowest stage?

A. The lowest stage recorded here was January 30th.

Q. Do you know whether or not it was frozen over at that time?

A. I do not.

Q. You have no record?

A. At this particular point?

Q. You have no record of that?

A. I have a record, yes, but I don't remember. I have a record.

Q. Of that fact?

A. That the river at this time along in here anyhow, from along in that period the week beginning January 30th, the river was frozen over because our men had to cut the ice with an ax to get the samples out. There is a record of that.

Q. You have that?

A. Yes sir.

ATTORNEY GENERAL CROW: Now I will offer that chart in evidence.

Said chart received in evidence and marked "Complainant's Exhibit 8—Frank S. Bright, Commissioner."

Q. Now what is that chart I show you?

637 A. This is a chart showing the weekly average results of the quantitative dtermination of the number of bacteria in samples of water collected daily from the Mississippi River at the Chain of Rocks, Intake tower, together with the height of the river at that point.

Q. Now who made that chart?

A. Mr. Johnson.

Q. What was it made from?

A. Made from data, from the quantitative determination of daily samples collected at this point.

Q. During what period of time?

A. Samples collected and sent to the bacteriological laboratory—bacteriological department of the St. Louis laboratory.

Q. From what time?

A. January 23rd to October 9, 1900.

Q. Who was in charge of that laboratory?

A. I was in charge of that laboratory.

Q. Who was Mr. Johnson?

A. He was first assistant.

Q. First assistant bacteriologist?

A. Yes sir, first assistant bacteriologist.

Q. Do you know that this chart was made from that data?

A. Yes sir.

Q. Do you know whether or not the chart is accurately made?

A. I think it was.

Q. Did you examine it with reference to that?

638 A. Yes sir.

Q. Now please explain those lines on there?

A. On the left hand margin of the chart will be seen figures written in red; they represent the bacteria per cubic centimeter and extend from zero to 250,000.

Q. That is at the Intake, isn't it?

A. At the Intake Tower, yes sir.

Q. Go ahead.

A. The stages of river in feet are in the next column, and extend from zero to 25.5 feet.

Q. Now the stages of the river are marked in blue?

A. The stages of the river are marked in blue, yes sir.

Q. And what do the figures and the dates and letters between the two black lines above the column in red and blue figures, represent?

A. That represents the average of daily observations for the week beginning January 23, and ending in the week beginning, October 2.

Q. Well, that gives the dates of these observations?

A. Yes sir.

Q. Those letters representing the months together with the figures representing the days of the months?

A. Yes, dates beginning—

Q. And those between the two black lines that are perpendicular, and the two columns of figures, is that right? 639

A. Yes sir.

Q. Now I wish you would just give me the stages of the water there at the Intake tower of the St. Louis water works, and locate that Intake tower with reference to the Missouri and the Missouri River?

A. The Intake tower is 1500 feet from the Missouri shore, and is in the channel of the river.

Q. Is this the source of the St. Louis water supply?

A. This is the source of the St. Louis water supply.

Q. Now give me the stages of the river there during this period.

A. The stages of the river,—in the week beginning January 23rd, 1900, 4.4 feet,

Week beginning January 30, 1 foot,
do. February 6, 4.5 feet,
do. February 13, 6 feet,
do. February 20, 7.6 feet,
do. February 27, 6.4 feet,
do. March 6, 16.6 feet,
do. March 13, 22.6 feet,
do. March 20, 17.8 feet,
do. March 27, 14.5 feet,
do. April 3, 15.5 feet,
do. April 10, 15.5 feet,
do. April 17, 16.5 feet,
do. April 24, 16.9 feet,
640 do. May 1, 16 feet,
do. May 8, 16.5 feet,
do. May 15, 15 feet,
do. May 22, 14.2 feet,
do. May 29, 13 feet,
do. June 5, 11.5 feet,
do. June 12, 12 feet,
do. June 19, 13.4 feet,
do. June 26, 12.5 feet,
do. July 3, 11 feet,
July 10, 10 feet,
July 17, 10 feet,
July 24, 12.5 feet,
July 31, 10 feet,
August 7, 7 feet,
August 14, 6 feet,
August 21, 9 feet,
August 28, 9.3 feet,

September 4, 9.5 feet,
September 11, 6.7 feet,
September 18, 6.5 feet,
September 25, 9.4 feet,
October 2, 12.6 feet.

Q. Now give me, please, as shown by that chart, the
641 **number of bacteria for the corresponding dates?**

A. Week beginning January 23, 154,000,
January 30, 135,000,
February 6, 75,000,
February 13, 134,000,—approximately,
February 20, 116,000,
February 27, 54,000,
March 6, 176,000,
March 13, 484,900,
March 20, 511,800,
March 27, 118,000,
April 3, 118,000,
April 10, 95,000,
April 17, 43,000,
April 24, 11,000,
May 1, 6,000,
May 8, 50,000,
May 15, 25,000,
May 22, 26,000,
May 29, 21,000,
June 5, 29,000,
June 12, 26,000,
June 19, 26,000,
June 26, 16,000,
642 **July 3, 12,000,**
July 10, 14,000,
July 17, 18,000,
July 24, 14,000,
July 31, 6,000,
August 7, 5,000,
August 14, 9,000,
August 21, 6,000,
August 28, 14,000,

September 4, 6,000,
September 11, 5,000,
September 18, 30,000,
September 25, 25,000,
October 2, 16,000.

Q. Now what, if anything is disclosed by this chart with reference to any relationship between the rise and fall of the Mississippi River at the Intake Tower of the St. Louis Waterworks, as to the increase or decrease in the number of bacteria found in the water during the period covered by this chart at said point?

A. When the river rises the number of bacteria increases.

Q. Well designate the place there?

A. At the Intake tower of the St. Louis Waterworks. This is weekly average results of the quantitative determination of bacteria per cubic centimeter of water, in samples of water collected daily in the Mississippi River at this point, and it shows that when the river falls the number of bacteria decreases, 643 but when the river rises at this point the number of bacteria rises also. When the river is at its greatest height, the number of bacteria is the greatest.

ATTORNEY GENERAL CROW: I will offer this chart in evidence.

Said chart received in evidence and marked by the Commissioner, "Complainant's Exhibit 9. Frank S. Bright, Commissioner."

Q. What is this chart that I show you?

A. It is for the year 1900, Grafton Illinois, River. This chart shows the weekly average results of the quantitative determination of the number of bacteria in samples of water collected daily from the Illinois River three miles above Grafton, Illinois, without the height of the river recorded.

Q. Now who made this chart?

A. Mr. Johnson.

Q. Who is Mr. Johnson?

A. My chief assistant during this time,—January 23, to October 2, 1900.

Q. From what data was it made?

A. Made from data collected from daily samples of water collected at a point three miles above Grafton, Illinois, on the Illinois river,—weekly averages obtained from it, and these weekly averages recorded upon this chart.

Q. Now what do the figures in the black and blue columns in the left represent?

A. On this chart on the left hand margin are the bacteria per cubic centimeter, and written in red from zero to 250,-
644 000 are recorded the number of bacteria.

Q. Do you know whether those figures and those dates, and the cross lines, are correctly made, based upon the data that you have described?

A. Yes sir, they are.

Q. Now, will you please give me the stages of the water at Grafton, for that period, if you have it?

A. I have, but not on this chart.

Q. Have you got them?

A. I have got the stages of the river at Grafton, Illinois. I have not averaged them up. I have them daily, and it would be quite a little labor to average them up.

Q. You have got the daily averages, though? The daily stages?

A. Yes sir.

Q. Well, you have got this other report here, as shown by this chart?

A. Yes sir.

Q. You have the stage of the water here, haven't you?

A. Yes sir.

Q. On this chart here?

A. No, I haven't the average of the water, I have the average number of bacteria.

Q. What does the blue column mean?

A. The blue column was intended to represent the stages
645 of the water, but they were not put in. We had a great deal of difficulty in getting these figures.

Q. Well, we can complete that and put them in.

JUDGE SPRINGER: Just put it in with the understanding that you can complete it.

ATTORNEY GENERAL CROW: No I will not put it in until he gets it completed and gets it straight.

THE WITNESS: It is not completed, it simply shows the bacteria per cubic centimeter at that time. I have got the figures here but I have not put them in.

Q. Now doctor, do you know anything about the condition or rather the location of the Intake tower of the St. Louis Waterworks prior to 1895?

A. I do, sir.

Q. Where was it located?

A. At Bissell's point,

Q. Where is Bissell's point?

A. Bissell's point is about three,—I suppose three and one-half miles from Market Street measuring by river.

Q. Which way?

A. Northwest. Up the river.

Q. Up the Mississippi River?

A. Yes sir, up the Mississippi River. It is located on the Mississippi River at a place called Bissell's Point.

646 Q. Now what was the shape or condition of that Intake tower at Bissell's Point, was it built similar to the one that is at the Chain of Rocks now?

A. No sir, not near so well built as the one now, nor so far from the shore. It was built a short distance from the shore, connecting by a bridge. It is an iron tower into which the water flowed and was lifted by pumps,—low service pumps to reservoirs that were located at this point. When the river was very low,—they had a movable intake which ran out on a tramway, carrying a flexibile tube to follow the river out. In that way, in low stages of the river, the water was pumped directly from the river instead of running into the Intake.

Q. Was that location at that time above the sewage from the City of St. Louis?

A. No sir, there was a creek, about 1,000 feet,—or rather about 1,000 feet above the Intake at Bissell's point, a creek known as Harlem Creek discharged itself into the Mississippi River. This has a drainage area upon which there resided at that time probably 10,000 people. The sewage from these 10,000 people discharged upon this drainage area and into this creek, also the offal from a number of dairy stables that were built on and projected over this creek. All of this material during freshets was washed into the Mississippi River and at times flowed directly into this Intake at Bissell's Point, I have seen it do it.

647 Q. Now do you know when the Intake was established at Bissell's Point,—what year?

A. I do not know.

Q. Do you know approximately how far back?

A. No sir.

Q. How long do you know of your own knowledge of its having been at Bissell's Point, prior to 1895?

A. I remember visiting—I remember it used to be quite a thing for the boys about town to visit the Park there, that is when I was a boy, twelve or fifteen years old—that is twenty-five years ago.

Q. Then twenty-five years ago it was located at Bissell's Point, was it?

A. Yes sir.

Q. That would be twelve or thirteen years prior to 1895?

A. Yes sir.

Q. Now do you remember the year in which it was moved from Bissell's Point?

A. Well, you mean—The Intake is still there,—the Bissell's Point Intake still remains; you can see that any time.

Q. But the water supply, I mean?

A. But the City stopped pumping from the river at that point, and began taking water from the Intake Tower at the Chain of Rocks in 1895.

648 Q. And the city takes no water for settling basins from Bissell's Point at this time?

A. The city pumps no water directly from the intake tower at Bissell's Point, but the water that flows into the Intake at the Chain of Rocks is lifted into a series of reservoirs, at the Chain of Rocks. From these reservoirs, part of it runs through a conduit to Baden, where it is pumped into the high-water service, and the remaining part of it runs to Bissell's Point and there discharges into reservoirs, and there rests for a time and finally runs into what is called the Big Well there, and is pumped by the low service pumps at that point throughout the eastern part of the city.

Q. Do you know why the city ceased taking its supply of water at Bissell's Point, and moved it further up the river?

A. I really don't know the reason for that, but I believe the pumps at that particular point were old and out of date, and new pumps had to be located to keep pace with the increasing demand for more water that the city was making upon it as it grew, so this point was selected, the land bought, and the Intake tower built, and new pumps put in at that point.

Q. Now do you know whether or not the sewage from Harlem Creek at this time, that is, January, 1900, ran into the Mississippi above Bissell's Point?

A. I know that in '92 it did run into the Mississippi River about 1,000 feet above the Intake at Bissell's Point, because I saw it doing it. That was early in '92, and the water ran into this intake—black, oily looking water that was discharged 649 from Harlem Creek ran into the yellow water of the Mississippi River at this point, and could be seen floating down the river, clinging to the shore on the Missouri side, and could be seen at times running directly into the Intake. I have stood on the bridge several times, with other gentlemen,—other physicians, and looked at it.

Q. Upon what bridge?

A. Upon the bridge that connected the Intake tower with the low service pumps.

Q. Do you know whether or not that is true at this time, or not?

A. I know that in '92 (1892) the attention of the Health Commissioner was called to this thing, of the typhoid epidemic having resulted from this Harlem Creek discharging the sewage into the Intake, and a dam was thrown across Harlem Creek and pumps used so that the water that came into Harlem Creek was stopped and pumped across, and discharged below the Intake of the waterworks.

ATTORNEY GENERAL HAMLIN: Into the Mississippi River?

A. Into the Mississippi River, yes sir.

ATTORNEY GENERAL CROW: What year was that?

A. '92.

ADJOURNED until 10:00 A. M., following day, Wednesday, February 25, 1903, at same place.

650 Southern Hotel, St. Louis, Missouri, 10:00 a. m., February 25th, 1903.

Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD, resumed the stand for further direct examination by Attorney-General Crow and testified as follows:

Q. Now, Doctor, I believe you stated you were acquainted with the conditions at the old Intake in 1892, at Bissell's Point?

A. Yes, sir.

Q. Now, do you know what time of year the typhoid epidemic followed the running of the sewage into that place?

A. Yes, sir.

Q. What time of year was it?

A. I wrote a paper on the subject.

Q. You wrote a paper on the subject?

A. Yes, sir.

Q. You have got the date, then?

A. Yes, I wrote a paper and read it before the Academy of Sciences here in 1894.

Q. What was the date?

A. It was in 1892, beginning in the latter part of August, 1892, and extending until February, 1893.

Q. Now, did you make a personal investigation to see whether or not the sewage was passing from Harlem creek into the Intake at Bissel's Point at that time?

A. Yes, sir.

Q. What was the result of that examination?

A. Standing on the bridge out on the Intake Tower at Bissell's Point, the black dirty water from Harlem creek could be seen running along in the yellow water of the Mississippi and entering the Intake tower of the St. Louis Waterworks.

Q. What time of year was that observation made.

A. I made that in October.

Q. 1892?

A. Yes, sir, in 1892. My attention was called to the fact that this thing was occurring, by Mr. Francis, Charles W. Francis, then Health Commissioner, and now Assistant Health Commissioner of St. Louis.

Q. Now, what steps, if any, were taken to remedy this, did you say?

A. The attention of the Water Commissioner was called to it—

Q. At what time?

652 A. In November, I believe, by Mr. Francis. With the aid of the St. Louis Medical Society—Mr. Francis called the attention of the medical society to this fact which I here relate, and he took with him five gentlemen, members of the medical profession, and went to this place and showed them this very thing I have described, the water of the Harlem creek entering the Intake of the St. Louis Waterworks. They, as a committee, reported back to the medical society and the attention of the Water Commissioner was called to it, and he put a dam across Harlem creek, over 500 yards back from the river. Pumps were established and the water pumped from this Harlem creek dam to a point below the Intake of the waterworks.

Q. When was that done; what time of year?

A. I don't remember.

Q. Well, it did happen after you made the observation?

A. Yes, it happened after we made the observation.

Q. Now, what was the effect of that?

A. That was practically the end of the typhoid fever there. There were little flurries following, but not to amount to anything, though.

Q. Now, have you any record of the number of typhoid cases in this city at that time?

A. Yes, sir.

Q. How many were there?

653 A. Well, from the report of the chief sanitary officer of the Health Department, for the fiscal year ending April 1st, 1893, 3,624 cases of typhoid fever were reported to the health authorities by the physicians of the city, with a total of 514 deaths.

Q. That was April, 1893?

A. April, 1893, his report was filed.

Q. For the year ending April?

A. He makes an annual report and the fiscal year ends March 31st.

Q. Now, have you got it for the preceding year?

A. I have it, not in figures here, but I have it on a chart.

Q. Do you know what it was?

A. I do not, but I can consult the chart, though.

Q. Where did you get these figures on the chart?

ATTORNEY-GENERAL HAMLIN: That is, for the preceding fiscal year?

A. Yes, the preceding fiscal year.

ATTORNEY-GENERAL CROW: Where did you get those figures on that chart?

A. From the annual report of the Health Department.

Q. Of this city?

A. Yes, sir, of this city.

Q. What do they show with reference to the years 1891
654 and 1892?

A. They say that from July, 1891, there were— The highest number of cases was recorded in a week in September, in the month of September, when 32 cases were reported, and the number of deaths—

Q. Yes, but haven't you got the total for the year there?

A. No, sir, I haven't the total for the year, but I can obtain the total for the year by adding these together; that will take time. I can obtain this from the reports of the Health Department. I haven't got the report here. This epidemic practically began in September and ended the latter part of January.

Q. Have you got the figures showing percentage of the increase during the year 1893, of typhoid over the preceding year?

A. No, I haven't the preceding year. I have the figures on the cases and deaths for the years 1892 and 1893 here, if you can have those entered now.

Q. Put them in.

A. For the month of April 14 cases and eight deaths, 1892 and 1893. You see the fiscal year began April 1st, that is the reason these figures run that way:

May, 13 cases reported, 9 deaths,

June, 32 cases reported, 4 deaths,
655 July, 35 cases recorded; 15 deaths,
August, 70 cases, 11 deaths,
September, 142 cases; 23 deaths,
October, 261 cases; 48 deaths,
November, 1,923 cases, 124 deaths,
December, 945 cases; 205 deaths,
January, 1893, 114 cases; 42 deaths,
February, 35 cases; 18 deaths,
March, 40 cases; 7 deaths.

That is all I have for that year. A great majority of the cases, 3,385, with 442 deaths, occurred during the months of September, October, November and December, 1892, and January, 1893.

Q. Now, Doctor, did you make any examination of the water bacteriologically of this Mississippi river and this creek at this time?

A. Yes, sir, I examined the Mississippi tap waters, from the tap in the bacteriological laboratory.

Q. What was the result?

A. I carried out a series of investigations and especially searching for the bacillus typhosus in the water.

Q. That is the typhoid bacillus?

A. Yes, and succeeded in separating out a micro-organism that resembled a stock culture very closely. This micro-organism I sent to some bacteriologists, among them William
656 Welsh of the Johns Hopkins University. I have his letter with his opinion upon that micro-organism, at the time, if you care to hear it.

Q. Well, was that micro-organism ever identified as anything other than the typhoid bacillus?

A. No, sir. I thought it was the typhoid bacillus at the time, and I still think so.

Q. What time was that taken from the tap; was it during this epidemic of the typhoid?

A. Yes, sir, it was November 8th.

Q. Now, did you make any bacteriological examination of the waters of that creek?

A. No, sir, I did not. It was crude sewage, and the numbers of bacteria would have been up into the hundreds of thousands, so I did not plate it.

Q. Did you examine the conditions along the banks of that creek up above its source?

A. Yes, I have gone all over that creek from its mouth.

Q. I mean at that time?

A. Yes, sir.

Q. What were the conditions of that stream?

A. I drove through there with a buggy twice; once in October and later on, I think it was in November, from the mouth of the river back to Broadway.

657 Q. What do you mean, the mouth of Harlem creek?

A. Yes, to Broadway. The country is flat; the creek runs through a deep gully, a very little piece south of Broadway, across Broadway and along it. All along here (indicating), from probably 500 yards from the mouth up to quite a distance along the creek I remember are a number of dairies, with their cow sheds projecting over this creek, and the manure is pitched out through the holes in the floor into the creek, great masses of it.

Q. That is, it was at that time?

A. Yes, lying, fermenting there, and is still.

Q. Well, that is unimportant now, but still, put it in.

A. I was over there the other day and saw it. Now, a part of this drainage district extends up into Bellefontaine cemetery, and the other part is a rolling upland, and is inhabited and the sewage from all the people on this drainage area, some probably 10,000, discharge into this creek, so that in dry weather, the dry weather flow of this small creek has black fetid water flowing in it.

Q. Were there any investigations made to determine whether or not the drainage of this creek prior to the breaking out of this epidemic—there were any cases of typhoid?

A. There were cases of typhoid.

Q. Among the population that was tributary?

658 A. On that drainage, yes, sir.

Q. Is there any record of those cases?

A. There is a record in the Health Department.

Q. Of this city?

A. Yes, sir.

Q. Now, have you made any study of the supply from a sanitary standpoint, of water for the use of cities, and for primary use, such as drinking and cooking purposes, as a bacteriologist?

A. Yes, I investigated that whole thing and went over the question of the water supply, the ice supply, the milk supply and all that sort of thing, of the city. Do you wish to read the opinion of Dr. Welsh?

ATTORNEY-GENERAL CROW: No, sir, unless the other side wants it. I have no objection to putting it in; but it wouldn't be competent evidence.

THE WITNESS: It is simply his opinion as to this micro-organism.

JUDGE SPRINGER: He is good authority.

A. Well, just a little bit.

Q. Now, Doctor, say within the limits of this city, is there any other source or supply of water, or was there at that time, in 1892, other than the water which was pumped from Bissell's Point?

659 A. Yes, sir; there were some 7,000 wells, shallow wells.

Q. Now, was there any investigation made at that time to determine whether or not any of the typhoid cases were among the people who used the well water?

A. A number of the wells throughout the city were inspected, and it was found that the typhoid fevers were uniformly distributed throughout the city and not around any particular well or wells, distributed independently of any well water.

Q. In your investigation of the matter at that time did you discover any cases among the families that used well water?

A. No, sir.

Q. Was the water of the river at that time filtered?

A. Filtered by the city?

Q. Yes.

A. It was pumped directly from the river into, I think, the settling basins there, but the demand was so great for water in the city that it rested for but a short time; it was practically water delivered from the river to the consumer, with the delay incidentally necessary to that of flowing through the pipes.

Q. Was there any investigation made of the ice and milk supply at that time?

A. Yes, I went over the ice question carefully, not only this time, but from my own home.

660 Q. Well, did you find anything wrong with the ice bacteriologically?

A. I found some ice, some Illinois river ice, which was used for cooling purposes here by the Loomis Ice Company; that ice contained quite a large number of bacteria. It was cut from sluices up above Peoria.

Q. *Did you examine the milk supply?*

A. Yes, sir.

Q. What did you find about that?

A. I found that a greater part of the milk that comes to the town, or that was distributed in the town, comes from the surrounding country. It is brought in by rail from a distance as high as 100 miles from St. Louis, in Missouri and Illinois, and is distributed by several dairy companies here, and there are also quite a number of small dairies in the outlying district, some of them in the city, but they are very small.

ATTORNEY-GENERAL HAMLIN: You are speaking of 1892, now, are you?

A. Yes, sir, 1892.

ATTORNEY-GENERAL CROW: Now, will you describe the methods you followed in that examination at that time?

A. Yes, sir. Instead of plating the water directly as it flowed from the tap, the sediment of the water was collected in this manner: We had a Pasteur filter in the college, and 661 the porcelain filter was taken out of it and sterilized, and then the water allowed to run through, the tap water. When a sediment had collected on the surface of the Pasteur filter about one millimeter deep, a sterilized platinum needle was taken and the mud scraped from off this filter. This was done a number of times, extending through quite a number of months. This sediment was sown in what is known as Pariettie's solution, that is, a broth neutral to litmus was made up and into ten cubic centimeters of it was dropped five drops of Pariettie's solution. Pariettie's solution is made up of carbolic acid, five parts, hydrochloric acid four parts and water 100. The intention here is to inhibit or hinder the growth of the number of micro-organisms that will not grow in the presence of carbolic acid, or in the presence of acids. Well, the typhoid

bacillus and the coli bacillus group do grow in the presence of this acid. The growth was incubated, or rather tubes were placed in an incubator at 37 centigrade and kept there for two days, and then plated in gelatine and the non-liquefying colony studied for colony characteristics. They have quite a number of colony characteristics on gelatine. I also used at that time a medium somewhat like Elsner's medium. That was made up of potato juice, a small quantity of potassium iodide and gelatine. I have forgotten how many colonies I studied.
662 The figures are there. Two or three hundred different colonies that resembled the typhoid bacillus were picked off and studied. Among them—they were numbered from 1 to whatever number—among them was number 21, and number 21 responded in nearly every way that was then known morphologically and culturally to which a typhoid stock culture was submitted. I received that stock culture from Dr. Cheesman, of the College of Physicians and Surgeons of New York City, and compared this micro-organism with it.

Q. That is No. 21?

A. Yes, sir, that is No. 21.

Q. What is the result of that comparison?

A. They resembled one another very closely. This microorganism which I had, No. 21, was a little bit shorter, I think, but otherwise it resembled it in its cultural characteristics very closely, so closely that it would come within the limits of variation of any one of the typhoid bacilli.

Q. Well, was there any scientific or bacteriological test for determining what was a typhoid bacillus?

A. Yes, I say, all known tests then.

Q. Were those tests that were then known applied to this bacillus?

A. Yes, it was submitted to every known test for the typhoid bacillus.

Q. What was the result?

663 A. The result was that it responded to all of them.

Q. Indicating that it was a typhoid bacillus?

A. Yes, and I so declared it.

Q. Now, did you make any test to see what might be the longevity of this bacillus?

A. Yes, I carried out a number of experiments with this micro-organism that were very interesting to me.

Q. Well, as to the length of life of this culture, were you enabled to grow this culture?

A. Yes.

Q. Now, what is the result of the longevity as compared with the longevity of typhoid bacillus?

A. In the tap water sterilized, in the cold, in an ice chest right up against the ice, why they lived, that is, this particular micro-organism lived from thirty to sixty days. That is steriled water now. Steriled tap water. Well, in the non-steriled water, waters that flowed from the tap, in the sunlight, they lived from twelve to fifteen days, and in the gloom or dark of that ice chest from 25 to 30 days.

Q. In non-steriled water?

A. Non-steriled water, yes, sir—tap water.

Q. Now, what is this map or chart that I show you?

664 A. The chart here shown shows the number of cases of typhoid fever and the number of deaths in St. Louis from 1890 to 1900, graphically.

Q. From what period of time?

A. From January, 1890, to December, 1900. It is a graphic representation.

Q. Now, who made that map?

A. I did.

Q. From what data did you make it?

A. Besides that, let me say further: Graphically represented in groups showing the weekly averages of the river stages at St. Louis—the Mississippi river.

Q. Does it show anything else besides these facts?

A. That is from this period of January, 1890, to December, 1900. The map goes further and shows another period which we will describe later.

Q. Now from what data did you make that map?

A. This was made from data secured from the St. Louis Health Department. The official statistics of the health department.

Q. Well, does that map show the number of typhoid fever cases?

A. Yes, sir.

Q. Does it show the number of typhoid deaths during that period?

A. Yes, sir.

665 Q. Now, during this period from 1890 to 1900, where was the water supply taken from?

A. From 1890 to 1895, the water supply was taken from the Mississippi river at Bissel's Point.

Q. Then from 1895 to the present time where has it been taken from?

A. At the present time it is taken from the Intake tower at the Chain of Rocks, Mississippi river.

Q. How far apart?

A. Six or eight miles from the Intake tower at Bissell's Point.

Q. Well, is the present source of supply further out in the channel of the river than was the supply at Bissell's Point?

A. Yes, sir.

Q. Have you any idea how much further?

A. I suppose a thousand feet further, but that is guessing.

Q. Now, will you explain what the different curved lines in the columns of figures on the left hand side of this map mean?

A. Well, on the left hand margin of this map are written figures beginning with zero and running up to 200.

ATTORNEY-GENERAL HAMLIN: What color are they in?

A. They are written in black ink and they represent the cases and deaths.

Q. ATTORNEY-GENERAL CROW: Of typhoid fever?

666 A. Of typhoid fever, yes sir. Well, in the second column, or third from the left hand margin, the stages of the river.

Q. The stages of the river at what point?

A. In feet.

Q. At what point?

A. They are taken from the government reports, and I think they are taken from the river at the foot of Market Street.

Q. In this city?

A. Yes sir, in this city.

Q. What do those curved lines indicate? Explain their relation if any, to those figures?

A. The curved line in blue indicates the stage of the river. It begins in January, 1900, and the stage of the river was 6.1 feet.

JUDGE SPRINGER: Does that mean above low water?

A. Yes sir.

Q. ATTORNEY GENERAL CROW: What do the black lines indicate?

A. They indicate the number of cases of typhoid fever reported to the Health Department.

Q. And what do the red lines indicate?

A. They indicate the deaths from typhoid fever.

Q. Now what connection, if any, is intended to be shown by these curved lines, irregular lines on the map, and the
667 figures on the left?

A. Well, the figures on the left as I say, indicate the number of cases and deaths, the extreme left hand figures on the second column from that. The figures in blue represent the stages of the river. On the lower margin of the map, are written the year and the months of the year, or is written the time, beginning 1900, January, February, March, April, May, June, July, August, September, October, November and December for each year.

Q. Now will you give me the figures you have there of the typhoid cases or the number of deaths for 1890?

A. I can read it, but that will be a laborious process.

Q. Well shorten it any way you can.

A. The better way to do that would be to have the report of the health department and read the figures directly from that.

Q. Have you got a copy of that?

A. I have not with me.

Q. Now have you those figures I asked you about?

A. Yes, I have. Beginning the week ending January 4th, 1890, 3 cases and 4 deaths.

Week ending January 11, 8 cases and 4 deaths. New cases recorded ending January.

668 Week ending January 18th, 2 cases reported, no deaths.

Week ending January 25th, 5 cases, 4 deaths,
do. February 1st, 5 cases, 3 deaths,
do. February 8th, 1 case, 1 death,
do. February 15th, 4 cases, 1 death,
do. February 22nd, 3 cases, 1 death.
March 1st, 2 cases, 1 death,
" 8th, 1 case, no deaths.
" 15th, 4 cases, 2 deaths,
" 22nd, 7 cases, no deaths,
" 29th, 3 cases, no deaths,
April 5th, no cases reported, 1 death,
" 12th, 3 cases, 1 death,
" 18th, 3 cases, no death,
" 26th, 2 cases, 2 deaths,
May 3rd, 1 case, no deaths,
" 10th, 5 cases, 2 deaths,
" 17th, 4 cases, 2 deaths,
" 24th, 2 cases, 4 deaths,
May 31st, 1 case, 1 death,
June 7th, 3 cases, 2 deaths,
June 14th, 1 case, 1 death,
June 21st, 1 case, 1 death,
669 June 28th, 5 cases, 4 deaths,
July 5, 7 cases, 2 deaths,
July 12th, 6 cases, 2 deaths.

Q. Have you got the totals of the months?

A. No sir, I have not. We will put that in.

Q. Have you got the totals for the months on your map?

A. Yes, but I didn't add them up as this was put down. That is, I didn't add them and record them.

Q. I don't think you understand me.

A. Yes, I do.

Q. Have you got the totals of those for each month from 1890, on your map?

A. Yes sir.

Q. In figures?

A. Yes, I have got the weekly estimates put in here of deaths for the month of January.

Q. You don't estimate a death do you? A death is a fact.

A. Well, a death is a fact.

Q. Do you mean the average deaths?

A. If we have four deaths they are recorded here.

Q. That is what I want. You have those on that map?

A. Yes, I have those on that map.

Q. What is the reason you can't read those figures?

A. It is impossible to read off of that. You want me to
670 read them off the map and it is almost impossible to do
that, as my eyes are troubling me, (Reading):

July 26, 11 cases reported, 3 deaths,
August 2, 13 cases, 4 deaths,
August 9, 21 cases, 5 deaths,
August 16, 20 cases, 4 deaths,
August 23, 13 cases, 4 deaths,
August 30, 19 cases, 4 deaths,
September 6, 13 cases, 10 deaths,
September 13, 28 cases, 4 deaths,
September 20th, 12 cases, 4 deaths,
September 27, 30 cases, 8 deaths,
October 4, 25 cases, 27 deaths,
October 11, 22 cases, 4 deaths,
October 18, 2 cases, 2 deaths,
October 25th, 25 cases, 8 deaths,
November 1, 16 cases, 5 deaths,
November 7, 7 cases, 3 deaths,
November 15, 15 cases, 4 deaths,
November 22, 11 cases, 1 death.
November 29, 17 cases, 8 deaths,
December 6, 7 cases, 3 deaths,
December 13, 8 cases, 1 death,
December 20, 3 cases, no deaths,
December 27, 4 cases, no deaths,

671 Q. Figure those up and give the totals?

A. You can't give those in that way. It takes too long to go through each year.

Q. How many of them have you got?

A. I have got from 1890 to 1900, also 1900.

Q. Go ahead.

A. (Reading): 1891, January 3, 7 cases, 3 deaths,
January 10, 2 cases, 2 deaths,
January 17, 1 case, 1 death,
January 24, 3 cases, 1 death,

January 31, 3 cases, no deaths,
February 7, 1 case, no deaths,
February 14, 1 case, 2 deaths,
February 21, 6 cases, 5 deaths,
February 28, 4 cases, 1 death,
March 7, 4 cases, 1 death,
March 14, 2 cases, 2 deaths,
March 21, 1 case, no deaths,
March 28, 5 cases, 1 death,
April 4, 2 cases, 3 deaths,
April 11, 7 cases, 2 deaths,
April 18, 1 case, no deaths,
April 25, 2 cases, 2 deaths,
672 May 2, 3 cases, 3 deaths,
May 9, 3 cases, 3 deaths,
May 16, 7 cases, 2 deaths,
May 23, 4 cases, 2 deaths,
May 30, 7 cases, 3 deaths,
June 6, 3 cases, 1 death,
June 13, 5 cases, 3 deaths,
June 20, 4 cases, 2 deaths,
June 27, 6 cases, 4 deaths,
July the 4, 6 cases, no deaths,
July 11, 11 cases, 3 deaths,
July 18, 6 cases, 1 death,
July 25, 9 cases, 7 deaths,
August 1, 12 cases, 6 deaths,
August 8, 5 cases, 1 death,
August 15, 19 cases, 4 deaths,
August 22, 11 cases, 8 deaths,
August 29, 11 cases, 2 deaths,
September 5, 10 cases, 5 deaths,
September 12, 13 cases, 3 deaths,

Year 1899:

First week in January, 9 cases, 3 deaths,
Second week, 9 cases, 6 deaths,
Third week, 5 cases, 1 death,
Fourth week, 3 cases, no deaths,
Total cases 28, deaths 10.

February—

First week, 3 cases, 2 deaths,
Second week, 3 cases, 4 deaths,
Third week, 3 cases, 1 death,
Fourth week, nothing,
683 Total cases, 9; deaths, 7.

March—

First week, 3 cases, 1 death,
Second week, 2 cases, two deaths,
Third week, 2 cases, 1 death,
Fourth week, 3 cases, no deaths,
Total cases, 10; deaths, 4.

April—
First week, 3 cases, no deaths,
Second week, 1 case, 1 death,
Third week, 2 cases, no deaths,
Fourth week, 9 cases, 2 deaths,
Fifth week, 3 cases, 2 deaths,
Total cases, 18; deaths, 5.

May—
First week, 1 case, no deaths,
Second week, 2 cases, no deaths.
Third week, no cases; no deaths,
Fourth week, 2 cases, no deaths,
Total cases, 5; no deaths.

June—
First week, 10 cases, 2 deaths.
Second week, 2 cases, 1 death,
Third week, 7 cases, 2 deaths,
Fourth week, 7 cases, 1 death,
Total, 26 cases, 6 deaths.

684 July—
First week, 10 cases, 1 death,
Second week, 4 cases, 3 deaths,
Third week, 7 cases, 3 deaths,
Fourth week, 11 cases, 1 death,
Fifth week, 7 cases, 2 deaths,
Total, 39 cases, 10 deaths.

August—
First week, 5 cases, no deaths,
Second week, 14 cases, 2 deaths,
Third week, 17 cases, 1 death,
Fourth week, 10 cases, 2 deaths,
Total cases, 46; deaths, 5.

September—
First week, 19 cases, 3 deaths,
Second week, 22 cases, 5 deaths,
Third week, 21 cases, 5 deaths,
Fourth week, 14 cases, 2 deaths,
Fifth week, 13 cases, 1 death,
Total, 89 cases, 16 deaths.

October—
First week, 25 cases, 4 deaths,
Second week, 22 cases, 5 deaths,
Third week, 9 cases, 2 deaths,
Fourth week, 19 cases, 4 deaths,
685 Total cases, 75; deaths, 15.

November—
First week, 21 cases, 2 deaths,
Second week, 62 cases, 5 deaths,
Third week, 190 cases, 8 deaths,
Fourth week, 171 cases, 12 deaths,
Total, 444 cases, 27 deaths.

December—
First week, 52 cases, 5 deaths,
Second week, 44 cases, 3 deaths,
Third week, 31 cases, 5 deaths,
Fourth week, 18 cases, 3 deaths,
Fifth week, 13 cases, 5 deaths,
Total cases, 158, deaths, 21.

January, 1900—
First week, 9 cases, 6 deaths,
Second week, 15 cases, 4 deaths,
Third week, 9 cases, 5 deaths,
Fourth week, 11 cases, 2 deaths,
Total, 44 cases; 17 deaths.

February—
First week, 18 cases, 5 deaths,
Second week, 10 cases, no deaths,
Third week, 7 cases, 1 death,
686 Fourth week, 5 cases, 1 death,
Total cases 40, deaths, 7.

March—
First week, 15 cases, 2 deaths,
Second week, 30 cases, 3 deaths,
Third week, 40 cases, 4 deaths,
Fourth week, 21 cases, 4 deaths,
Fifth week, 17 cases, 4 deaths,
Total 126 cases, 17 deaths,

April—
First week, 15 cases, 1 death,
Second week, 9 cases, 2 deaths,
Third week, 3 cases, 1 death,
Fourth week, 4 cases, no deaths,
Total, 31 cases, 4 deaths,

May—
First week, 6 cases, 2 deaths,
Second week, 6 cases, no deaths,
Third week, 6 cases, no deaths,
Fourth week, 6 cases, no deaths.
Total, 24 cases, 3 deaths.

June—
First week, 4 cases, 1 death,
Second week, 5 cases, 2 deaths,
Third week, 6 cases, 1 death,
687 Fourth week, 5 cases, 1 death,
Fifth week, 9 cases, 4 deaths,
Total cases 29, deaths 9.

July—
First week, 9 cases, 3 deaths,
Second week, 12 cases, 5 deaths,
Third week, 9 cases, 2 deaths,
Fourth week, 7 cases, 4 deaths,
Total cases, 37; deaths, 14.

August—
First week, 15 cases, 4 deaths,
Second week, 18 cases, 3 deaths,
Third week, 32 cases, 2 deaths,
Fourth week, 37 cases, 9 deaths,
Total cases 102; deaths 18.

September—
First week, 23 cases, 6 deaths,
Second week, 25 cases, 2 deaths,
Third week, 52 cases, no deaths,
Fourth week, 62 cases, 4 deaths,
Fifth week, 104 cases, 4 deaths,
Total cases 266; deaths 16.

October—

First week, 85 cases, 7 deaths,

688 Second week, 75 cases, 4 deaths,

Third week, 44 cases, 6 deaths,

Fourth week, 40 cases, 8 deaths,

Total, 244 cases; 25 deaths,

This is as far as this table goes.

Q. October, what year?

A. October, 1900.

Q. Now from this map you have I will get you to state if there is any relationship, if so, what, between the stages of the river as indicated by that map and the increase or decrease of typhoid fever in the city of St. Louis, in the years 1890, to 1900?

A. Why we find, in consulting this map, that as a rule, when the river is low, the typhoid fevers were high, the number of cases and deaths.

ATTORNEY GENERAL HAMLIN: Do you mean water low at the In-take?

A. The water low in the river.

GENERAL CROW: I will get you to state if there have been any epidemics of typhoid from 1890 up to 1900, that is up to the 1st of January, 1900?

A. Well, there was that great epidemic of which I spoke, that was in 1892. That is shown very markedly here.
689 It runs off the map in fact (indicating).

Q. Now coming down to the right hand side of this map. What is the chart that is drawn separate on the right hand side of this ruled paper?

A. There is a separate chart running to December, 1900. Upon this chart is shown the curves showing the weekly average of the stage of the Mississippi River at St. Louis; percentage of Mississippi water in; total solids, flowing into the Intake, and number of typhoid fever cases for the year 1900.

Q. Explain what you mean by total solids?

A. Total solids is a term used by chemists, and is the residue or rather the sediment remaining after evaporating, definite quantities of water at boiling temperature, water at 100 Centigrade; 212 Fahrenheit. At that temperature water is evaporated, and the residue, remaining is the total solids.

Q. Who made this map?

A. I did, or rather it was made under my direction.

Q. Where did you get the data from which to make it?

A. The data of the typhoid cases was taken from the Health Department.

Q. Where did you get the other data?

A. The total solids were taken from the figures of Dr. William C. Teichmann, City Chemist. The river stages were taken from the Government reports.

690 Q. Now what do the various lines on there indicate and the numbers?

A. The numbers on the left hand side of the map here, written in black ink are for the number of cases and deaths from typhoid fever.

Q. During what period or term?

A. During the period from January 1st, 1900, to December 29th, 1900. The figures to the right of this written in blue are for the stages of the river.

Q. Now, what do the lines on the surface of this map indicate?

A. The curved green line shows the weekly averages of the Missouri River; the stages of the Missouri River.

Q. At what point?

A. At Herman, Missouri.

Q. Where is that located with reference to the Intake tower of the Waterworks of the City?

A. It is some distance up the Missouri River, over a hundred miles, so that it is quite a distance from the Intake tower. That is the point at which the Government made its readings. It is in the meteriological report which I can show you. The line in blue is the weekly averages of the stage of the Mississippi River at the foot of Market Street.

691 Q. What are the other lines?

A. The brown line shows the percentage of Mississippi River water going into the Intake.

Q. At the Chain of Rocks?

A. At the Chain of Rocks.

Q. That is the Intake of this city?

A. The Intake of the St. Louis Water works.

Q. What do the other lines represent?

A. The red line indicates the number of cases of typhoid fever reported to the Health Department.

Q. Is there anything on this map to indicate the number of deaths?

A. No sir.

Q. You say the brown line represents the percentage of Mississippi River water?

A. Yes sir.

Q. Now from what data was that taken?

A. Taken from the data of Dr. William C. Teichmann, City Chemist.

Q. What kind of details was that?

A. Chemical details; total solids the results of chemical analyses of samples taken at the Intake Tower.

Q. Now will you please take your figures and the lines on
that map there and just give the number of typhoid cases
692 beginning in January, and the percentage of the water of
the Mississippi River, and the stages of the river up to
the 29th of December as shown by this map?

A. The figures for 1900 have been all given; do you want me to give them again?

Q. They have not been given as shown on this map.

A. Yes, those are the figures there.

Q. Doctor, just give the percentage that is shown on the map.

A. 1900, week ending January 6, 9 cases, 6 deaths,
Week ending January 13, 15 cases, 4 deaths,
Week ending January 20, 9 cases, 5 deaths,

Q. January 6, you have nine cases?

A. Yes sir. The Mississippi River stage, that is the datum point here on Market Street—a piece of iron is sunk into the river at Market Street, and from this the stages of the river are read from the first, up and down. We find on the 15th, the week ending January 6, the river stage here is marked one below zero, that is, for the Mississippi River, and for the Missouri River it is marked 1.9.

January 13th we find fifteen cases; four deaths.
Stage of the Mississippi River 2.3.
Stage of Missouri River 3 feet.

January 20, number of cases 9; deaths 5.
Stage of the Mississippi River 3.2 feet;
693 Stage of Missouri River 4.4 feet.

January 27, 11 cases, 2 deaths,
Stage of the Mississippi River 6.4 feet,
Stage of the Missouri River, 5.4 feet.

February 3, 18 cases, 5 deaths,
Stage of the River 2.8 feet for the Mississippi.
Stage of the Missouri River 3.6 feet.

Week ending February 10, ten cases, no deaths.
Height of the River—Mississippi, 2 feet,
do. Missouri, 2.9 feet.

February 17th, or third week, 5 cases, 1 death:
Height of Mississippi River 6.6 feet,
Missouri River 3.6 feet.

February 24th, 7 cases, 1 death,
Height of the Mississippi River, 6.7 feet.
Height of Missouri River, 3.4 feet.

March 3rd, 15 cases, 2 deaths,
Height of Mississippi River 7.2 feet,
Height of Missouri River 5.8 feet.

694 March 10th, 30 cases, 3 deaths,
Height of Mississippi River 12.5 feet.
Height of Missouri River 10.6 feet.

March 17th, 40 cases, 4 deaths,
Height of Mississippi River 22.4 feet,
Height of Missouri River 16.2 feet.

March 24th, 24 cases, 4 deaths,
Height of Mississippi River 19.4 feet,
Height of Missouri River 12.2 feet.

March 31st, 17 cases, 4 deaths,
Height of Mississippi River 15.2 feet,
Height of Missouri River 8.4 feet.

April 7th, 15 cases, 1 death,
Height of Mississippi River 14.6,
Height of Missouri River 9 feet.

April 14th, 9 cases, 2 deaths,
Height of Mississippi River 16.8 feet,
Height of Missouri River 10.2 feet.

April 21st, 3 cases, 1 death,
695 Height of Mississippi River 16.8 feet,
Height of Missouri River 11.4 feet.

April 28th, 4 cases, no deaths,
Height of Mississippi River 17 feet,
Height of the Missouri River 11.4 feet.

May 5th, 6 cases, 2 deaths,
Height of Mississippi River 15.8,
Height of Missouri River 11.4 feet,

May 12th, 6 cases, no deaths,
Height of the Mississippi River 15.8 feet,
Height of the Missouri River 11 feet.

May 19th, 6 cases, 1 death,
Height of Mississippi River 14 feet,
Height of Missouri River 11.2 feet.

May 26th, 6 cases, no deaths,
Height of the Mississippi River 14 feet,
Height of the Missouri River 11.4 feet.

June 2, 4 cases, 1 death,
Height of Mississippi River 13.2 feet,
Height of Missouri River 11.6 feet.

696 June 9th, 5 cases, 2 deaths,
Height of the Mississippi River 12.2 feet.
Height of the Missouri River 10.8 feet.

June 16th, 6 cases, 1 death,
Height of Mississippi River 11.6 feet,
Height of Missouri River 11.4 feet.

June 23, 5 cases, 1 death,
Height of Mississippi River 12.3 feet,
Height of Missouri River, 11.8 feet.

June 30th, 9 cases, 4 deaths,
Height of Mississippi River 13.6,
Height of Missouri River 12.3 feet.

July 7th, 9 cases 3 deaths,
Height of Mississippi River 11.4 feet,
Height of Missouri River 11.4 feet.

July 14th, 12 cases, 5 deaths,
Height of Mississippi River 10.4 feet,
Height of Missouri River 11 feet.

697 July 21st, 9 cases, 2 deaths,
Height of Mississippi River 9.14 feet,
Height of Missouri River 9.8 feet.

July 28th, 7 cases, 4 deaths,
Height of Mississippi River 12.4 feet,
Height of Missouri River 11.2 feet.

August 4th, 15 cases, 4 deaths,
Height of Mississippi River 11.4 feet,
Height of Missouri River 9.2 feet.

August 11th, 18 cases, 3 deaths,
Height of Mississippi River 8 feet,
Height of Missouri River 7 feet.

August 18th, 32 cases, 2 deaths,
Height of Mississippi River 5.4 feet,
Height of Missouri River 5.8 feet.

August 25th, 37 cases, 9 deaths,
Height of Mississippi River 8.6 feet,
Height of Missouri River 6.8 feet.

698 September 1st, 23 cases, 6 deaths,
Height of Mississippi River 9 feet,
Height of Missouri River 7.6 feet.

September 8th, 25 cases, 2 deaths.
Height of Mississippi River 10 feet,
Height of Missouri River 8.2 feet.

September 15th, 52 cases, no deaths,
Height of Mississippi River 7.6 feet,
Height of Missouri River 5.8 feet.

September 22nd, 62 cases, 4 deaths.
Height of Mississippi River 6.4 feet,
Height of Missouri River 5.1 feet.

September 29th, 104 cases, 4 deaths.
Height of Mississippi River 8 feet,
Height of Missouri River 6.1 feet.

October 6th, 75 cases, 7 deaths,
Height of Mississippi River 12 feet,
Height of Missouri River 8.6 feet.

October 13th, 75 cases, 4 deaths,
Height of Mississippi River 12.3 feet,
Height of Missouri River 8.7 feet.

699 October 20th, 44 cases, 6 deaths,
Height of Mississippi 10.3,
Height of Missouri 5.8 feet.

October 27th, 40 cases, 8 deaths.
Height of Mississippi river 11.8 feet,
Height of Missouri river not recorded.

November 3rd, 33 cases, deaths not recorded.
Height of Mississippi river 12.4 feet.
Height of Missouri river not recorded.

November 10th, 33 cases; deaths not recorded.
Height of Mississippi river 13 feet.
Height of Missouri river not recorded.

On October 20th we run out of deaths and Missouri river stages. I didn't have the data.

November 17th, 23 cases,
Height of Mississippi river 12.2 feet.

November 24th, number of cases 42.
Height of Mississippi river 12.1 feet.

700 December 1st, 23 cases.
Height of Mississippi river 11.2 feet.

December 8th, 41 cases.
Height of Mississippi river 8 feet.

December 15th, 19 cases.
Height of Mississippi river 6.3 feet.

December 22, 24 cases.
Height of Mississippi river 4.6 feet.

December 29th, 15 cases.
Height of Mississippi river 3.5 feet.

Q. Now, doctor, what does this map show with reference to the whole period of ten years, with reference to what period or year typhoid was the most prevalent?

A. The typhoid was the most prevalent in 1892, and in this period and in the period before—

Q. You don't understand my question. I want to know at what season of the year prior to January 1st, 1900, this map shows that typhoid fever was the most prevalent in the City of St. Louis, if it shows that fact?

701 A. In the fall and winter months.

Q. Now, does the latter part of this map on the right hand side indicate the percentage of Mississippi river water that is going into the Intake. It is given on the lower side of the map?

A. Yes, sir.

Q. Now, with reference to the highest number of typhoid cases recorded and the lowest number, is there any relationship between the percentage of Mississippi river water as shown by this map going into the Intake tower of the St. Louis Waterworks, if so, what is that relationship?

A. Well, we find that in the early part of the year from February 6th, the quantity of water estimated by total solids in the Mississippi river increased at the Intake and reached a hundred per cent. on February 8th, 1900.

Q. I will ask you a question right at that point—well, go ahead.

A. It fell on the 9th to 78 per cent., and on the 10th of February it fell to 62 per cent.

On the 12th it fell to 46 per cent.,

On the 13th to 35 per cent.,

On the 14th to 24 per cent.,

On the 15th to 12 per cent.

Q. Well, now, what is the period of time do you say from
702 your medical knowledge that after a person receives the
typhoid bacillus into his stomach, that the disease will
develop?

A. That varies from five or six days, to three or four weeks. You mean the period of incubation?

Q. Yes?

A. Yes, sir.

Q. Now, is there any relationship as shown by this map between the rise in the number of cases of typhoid fever and the rise in the percentage at the times you mention of the water in the Mississippi river at the Intake tower?

A. Yes, sir.

Q. Just explain what that is?

A. As I showed you already. That is, on the 8th, 100 per cent. of Mississippi river water, as it came into the Intake tower of the St. Louis Waterworks.

Q. What do you mean when you say 100 per cent?

A. 100 per cent. of Mississippi river water. In other words, the Mississippi water only, not mixed with the Missouri water, went into the Intake tower, and on March 3rd there was an increase in the typhoid cases.

Q. How many days later is that?

A. That is February 8th and March 3rd, and 23 days later a rise in the typhoid death rate was noted, and that increased until March 17th, gradually decreasing with the falling out of the Mississippi water here. The Mississippi water at the intake reached 12 per cent. on the 17th of February, and the
703 typhoid fever cases on April 21st were recorded only 4.
So that there was an increase of the typhoid cases from March 3rd up to March 17th, then a gradual decrease to March 24th, and from March 31st to April 7th, and as I say, reached the low number of four on the 21st.

Q. Now, do you know anything about how long the water is allowed to remain in the settling basins after it is pumped from the Intake tower?

A. Yes, from 36 to 70 hours.

Q. Before it is sent directly to the consumer?

A. Yes, sir.

Q. Do you know anything about the amount of consumption of water in this city in the year 1900, with reference to the volume that was sent out every twenty-four hours from the basin?

A. I do not.

Q. I suppose the waterworks people will tell us that?

A. That is in the Waterworks Commissioner's report.

Q. Now, go ahead and trace the relationship, the percentage of the Mississippi river water to the increase or decrease?

A. What I want to call attention to at that time is, that both rivers were falling, at this particular time.

704 Q. Both of what rivers?

A. The Mississippi and the Missouri. From January 27, to February 10th the Mississippi river was falling, in 1900, and the Missouri River also at those dates was falling.

Q. That is from January 27th to February 10th?

A. Yes.

Q. Do you know anything about the condition of the Illinois river from January 27th to February 10th?

A. I know that from February 6th, I think it is, to February 20th, the Illinois river was high.

Q. Do you know whether or not the Mississippi and Missouri were frozen over from February 3rd, to February 20th?

A. Yes, they were frozen over in that period. I think about the 20th they broke up.

Q. What effect on the oxidation by bacteria or organic matter, and animal and inorganic matter, in the water, does the freezing over of the river have?

A. The bacteria do not multiply very rapidly in cold water; they remain dormant.

Q. Well, the oxygen is shut out of the water by the freezing of the ice?

A. Yes, but there is enough oxygen in the water for the bacteria, if they could multiply in the temperature, but not so much as when the river is open?

Q. But not so much as when the river is open?

A. No, sir.

705 Q. What is the result of the decomposition of the inorganic matter in the water?

A. It is not decomposed.

Q. In so great a quantity?

A. In so great a quantity.

Q. If there was organic animal matter in the water of the Mississippi river and in the Missouri at this time, its decomposition would be the result, if it was open and not frozen?

A. Yes, and the temperature higher, and the temperature not near freezing point.

Q. Now, do you know the stage of the Illinois river at this period, have you got that?

A. I haven't it, no, sir; I haven't recorded it, but I have it at Peoria.

Q. At this time?

A. Yes, sir.

Q. Just give that, will you? Turn to it and we will put it in the record right here.

A. I have the stages for Peoria and Grafton.

Q. Well, just give them to me at this period.

A. Do you want the Illinois first?

Q. Yes, sir.

A. Beginning what date?

706 Q. Well, beginning—

A. Well, the Chicago Drainage Canal was opened on January 17th, 1900. Do you want me to begin with that?

Q. Yes.

A. January 17th, at Peoria, 5.1 feet,
January 18th, 5.7 feet,
January 19th, 6.1 feet,
January 20th, 6.6 feet,
January 21, 7.1 feet,
January 22, 7.5 feet,
January 23, 7.7 feet,
January 24th, 7.8 feet,
January 25th, 8.1 feet,
January 26th, 8.1 feet,
January 27th, 8.1 feet,
January 28th, 7.9 feet,
January 31st, 7.8 feet,
February 1st, 7.7 feet,
February 2nd, 7.8 feet,
February 3rd, 7.8 feet,
February 4th, 7.9 feet,
February 5th, 7.7 feet,
February 6th, 7.7 feet,
February 7th, 7.5 feet,
707 February 8th, 8.3 feet,
February 9th, 9.3 feet,
February 10th, 10 feet,
February 11th, 10.5 feet,
February 12th, 11 feet,

February 13th, 11.5 feet,
February 14th, 11.5 feet,
February 15th, 11.5 feet,
February 16th, 11.4 feet,
February 17th, 11.4 feet,
February 18th, 11.5 feet,
February 19th, 11.5 feet,
February 20th, 11.5 feet,
February 21st, 11.4 feet,
February 22nd, 11.5 feet,
February 23rd, 11.6 feet,
February 24th, 11.4 feet,
February 25th, 12 feet,
February 26th, 12.3 feet,
February 27th, 12.3 feet,
February 28th, 12.4 feet,
March 1st, 12.3-feet,
708 March 2nd, 12.2 feet,
March 3rd, 12 feet,
March 4th, 11.8 feet,
March 5th, 11.6 feet,
March 6th, 11.6 feet,
March 7th, 11.4 feet,
March 8th, 11.3 feet,
March 9th, 11.4 feet.
March 10th, 11.8 feet,
March 11th, 12.5 feet,
March 12th, 13.8 feet,
March 13th, 15.4 feet,
March 14th, 17.4 feet,
March 15th, 19.2 feet,
March 16th, 19.9 feet,
March 17th, 19.9 feet,
March 18th, 19.5 feet,
March 19th, 19 feet,
March 20th, 18.7 feet,
March 21st, 18.3 feet,
March 22nd, 17.8 feet,
March 23rd, 17.6 feet,
March 24th, 17.3 feet,

March 25th, 17 feet,
March 26th, 16.7 feet,
709 March 28th, 16.1 feet,
March 29th, 16 feet,
March 30th, 15.8 feet,
March 31st, 15.7 feet.

Q. What, if anything, do those figures show as to whether or not the Illinois River was rising from the 27th of January on up to the 20th of February?

A. It shows that from the 23rd day of January, or from the 17th of January there was a steady rise in the Illinois River until the 29th of January, when eight feet were recorded, then there was a fall of seven and 9-10 feet, and 7.8 feet on February 1st.

February 2nd, 7.8 feet,
February 3rd, 7.8 feet,
February 4th, 7.9 feet,
February 5th, 7.7 feet,
February 6th, 7.6 feet.

JUDGE SPRINGER: When did the rise begin?

A. The rise began on the 8th, when 8.3 feet was recorded, and on the 9th, 9.3 feet, and on the 10th, ten feet.

Q. There is no use repeating. Say it rises in the river steadily.

A. Rising through February, March and April.

Q. When was the maximum?

710 A. 19.9 feet was reached on the 17th of March, that is the highest.

Q. Do you know what date the Illinois River broke up?

A. Well, from what I understand, there was a thaw along the Illinois River beginning the 7th of February and it extended to April 12th. The river I see here begins to rise on the 8th, and rises steadily, from the 8th of February, and from the bacteriological record, and from personal recollection of samples collected at Peoria, at Joliet and Grafton, I know the condition of that water.

Q. Now you have got the stages of the river at Grafton for those dates?

A. Yes sir.

Q. Now give them to me from the 17th of January up to the 20th of February: That is all I want.

A. Hold on. I meant to say that for the Illinois River at Grafton, or the Mississippi at Grafton, this chart is not marked.

Q. Will you look that up and see?

A. Yes I will look that up.

Q. Now answer the other question I asked you there. Trace the relationship there between the percentage of the Mississippi River water as shown by this map and the increase or decrease of the typhoid fever rate?

711 A. We have traced that increase from March. That is for February, and the increase of typhoid fever that occurred in March in St. Louis, and no such thing has ever been known before in the history of this town; the Illinois River high, and the other two rivers covered with ice, and the Mississippi water coming into the Intake in 100 per cent. Now as the rains began and the spring thaw began on the drainage area of all these rivers in the latter part of February, and in March, there was high water for all these rivers, so that the flood flowing into the Mississippi River was very great. From the 17th of February on, we find the highest stage of the Mississippi reached at this point was on March 17th, 1900, and the highest stage also recorded for the Missouri at this period.

JUDGE SPRINGER: What was the stage?

A. The Mississippi 22.4 feet, and for the Missouri River 16.2 feet. Then the rivers fell until March 31st, when again there was a rise. Then a gradual fall until the fall rise, which began on September 29th. Now at this time, according to the total solids, that is, beginning on March 3rd, and reaching its acme on March 24th, we find that on March 24, 25, 26, 27, and 28th there was 100 per cent of Mississippi River water going into the Intake at St. Louis Waterworks, Chain of Rocks.

712 Then there was a fall to 62 per cent on the 29th of March; again a rise on the 31st to 100 per cent; then a fall to 87 per cent on the first of April and on the 2nd of April to 50 per cent. Then a rise on the 3rd of April to 62 per cent, and a fall to 56 per cent on the 5th. And on the 6th to 32 per cent, and then on April 7th to 1 per cent; then again it rapidly rose.

Q. Now what was the number of typhoid cases?

A. At flood volume of the river. It was very high at this time and the number of typhoid cases rapidly diminished. All the rivers were very high, and the quantity of the pollution was very great.

Q. And the percentage of the Mississippi River water at the Intake was high?

A. High at one period, at the very high period.

Q. It wasn't high when all the rivers were at flood tide?

A. Yes, it was high once.

Q. At what time?

A. That is the period I have just referred to from March 24th to 31st.

Q. How high was it?

A. 100 per cent. I named the dates.

Q. Did it reach 100 per cent. twice in the spring and fall of 1900?

A. Yes sir.

713 Q. Go ahead.

A. So the quantity rises and falls; that is, the percentage of the Mississippi River water at the Intake rises and falls until May 28th, when it is at its lowest; then it remained low, that is, rising and falling to a slight degree until July 29th, when it again rose, and the amount of Mississippi River water going into the Intake reached 39 per cent. I can read farther on if you care to have me. I can read right straight through.

Q. Well just trace the relationship there is in it between the typhoid rate and the percentage of the Mississippi River water.

A. The rivers during this stage now, are—The Mississippi at the Intake is falling when its percentage reaches 39; then the percentage fluctuates between the dates July 29th to August 7th, when it reaches six per cent. On August 31st the percentage again reaches fifty per cent. It falls on August 2nd, to 2 per cent; then rises again to 28 per cent until the 5th of September. On the 7th of September it falls to four per cent, then it rapidly rises to the 12th, when it reaches 40 per cent.

Q. Now what is the number of typhoid cases at that time?

A. The number of typhoid cases at that time was in-
714 creasing, with the increase of the Mississippi River water
at the Intake at this low stage of the river.

Q. What was the number at that particular point?

A. Forty cases. The percentage now fluctuates between 26 per cent on the 15th of September to 46 per cent on September 22nd; then there is a fall again, September 25th to 34 per cent; then a steady rise until the percentage of 64 per cent is reached on October 4th. Then it falls on October 6th, to 27 per cent. Rises on the 7th, October 7th, to 42 per cent; falls on October 9th to 24 per cent; on October 10th to 26 per cent, and the record ends there.

I want to say this: When the flood volume of the river is very great the percentage of typhoid is very low.

Q. What water?

A. The percentage of the Mississippi River water at the Intake, when the river is high, the typhoid is low. The typhoid fever rate increases with the increased per centage of Mississippi River water going into the Intake.

ADJOURNED until 2:15 P. M., same day, February 25th, 1903 at same place.

715 2:15 P. M., Wednesday, February 25, 1903, Southern Ho-
tel, St. Louis, Missouri. Continuation after recess. Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD,

Resumed the stand for further direct-examination by Attorney General Crow, and testified as follows:

Q. Let us see; where did we stop with this. doctor? Let us finish it up?

A. We finished it up.

Q. Take all this period here, the latter part or half of 1900, just give us the periods of time—just the dates, that is all, at which the typhoid was the greatest in the City of St. Louis—I just simply want the dates as shown by your map.

A. For the March term,—for March 3rd to March 31, extending into April 7th,—March 3rd to April 7th, was one period, and from August 1st to December 15th.

Q. Now have you ever made any calculation to determine what percentage of increase there was in March, 1900, of the typhoid rate in this city, or with that of the month preceding, February, 1900?

A. It was greater for the period of March,—you mean 716 for the period of February there is very little difference. For March there is an increase.

Q. Over February?

A. Over March of the previous year.

Q. Well how about February though?

A. It is greatly increased here in March over February of the present year, 1900.

Q. Now as to the preceding year, 1899?

A. I have not made a calculation of it.

Q. Well, never mind, then.

A. I mean I haven't it in figures here, but you can show what it is.

Q. Well, what was it?

A. The number of cases 5. The highest number recorded for February in cases, is 8—February, 1898, that was.

Q. For 1899?

A. For February, cases and deaths, the highest number of cases recorded was three cases,—four deaths, that is the highest recorded for February, 1899?

Q. What was it in March, 1899?

A. For March, 1899, lower than that; it was three cases,—is the highest,—the highest for any one week.

ATTORNEY GENERAL HAMLIN: Reported?

A. Reported as to deaths.

Q. ATTORNEY GENERAL CROW: How was it in March and February, 1897?

717 A. March, 1897, one week here, three cases, the highest in any one week in March.

Q. How was it in 1896?

A. March, six cases.

Q. Do you know what time in 1895, the Intake was moved from Bissell's Point to where it is at present?

A. I do not. I know that the Intake was up there, but I don't know when they began pumping water.

ATTORNEY GENERAL HAMLIN: What was the highest number recorded in March, 1895?

A. March, 1895, six.

ATTORNEY GENERAL CROW: You can run on back to 1894; put it in from way back if you want to.

A. Now the highest recorded in March, 1894, is fifteen cases—that is the last week in March, 1894.

Q. Now at that time where was the Intake?

A. The Intake was at Bissell's Point.

Q. How far below the present place?

A. About six miles.

Q. Well, go ahead, back to 1893?

A. In 1893, March, fourteen is the highest in that month.

Q. Go on back?

A. March, 1892, five cases.

Q. March, 1891?

A. March, 1891, six cases.

Q. March, 1890?

A. Seven cases

718 Q. That runs it back to 1890?

A. To 1890.

Q. Now doctor, is there anything else you want to say about this map?

A. The highest recorded in March was on the 17th of March, 1900, forty cases.

Q. Now is there any further explanation you want to make about this map?

A. I see no other.

ATTORNEY GENERAL CROW: I will offer this as an exhibit then.

Said map received in evidence and marked by the Commissioner "Complainant's Exhibit No. 10. Frank S. Bright, Commissioner."

Q. Now what is that map I show you?

A. This chart is for the third period, 1901, for the months of October and November.

Q. Now what is that chart?

A. It shows the results of the daily determination of the number of bacteria in samples of water collected from Drainage Canal at Bear Trap Dam, Lockport, below Ruby Street, Joliet, and Brandon's Bridge, Joliet.

Q. Well now, just explain the marks and the figures on that map, will you?

A. The bacteria per cubic centimeter are ranged along the left hand margin of the map, beginning with 200,000 and extending up to 5,000,000 bacteria per cubic centimeter. Now the bacteria at the Bear Trap Dam, Lockport, are marked in black ink. The bacteria at Ruby Street, Joliet, are in red; Brandon's Bridge, Joliet is in green.

719 Q. Well, what do the cross lines on there represent?

A. Well, on the fourth space at the top of the map are the dates, beginning September 26 and ending November 29, the number of bacteria are recorded every third day,—no, they are recorded every day. Now the black lines, beginning at 1,250,000 for the Bear Trap Dam, Lockport; that was on September 26th. On the 27th it drops to 650,000;

On the 28th, 650,000,
September 29, 1,250,000,
" 30, 3,075,000,
October 1, 350,000,
" 2, 75,000,
" 3, 350,000,
" 4, 50,000,
" 5, 300,000,
" 6, 875,000,
" 7, 775,000,
" 8, 25,000
" 9, 75,000,
" 10, 200,000,
' 11, —The figures for October 11th are not in.
We begin on the 12th,—50,000,
720 October 13, about 75,000,
" 14, 75,000,
" 15, about 175,000,

Then it takes a jump.

October 16, 2,150,000,
" 17, 1,100,000,
" 18, 1,750,000,
" 19, 150,000,

October 20, 100,000,
" 21, 100,000,
" 22, 50,000,
" 23, about 50,000,
" 24, 175,000,
" 25, 1,800,000,
" 26, 225,000,
" 27, 250,000,
" 28, 1,825, 000,
" 29, 125,000,
" 30, 275,000,
" 31, 300,000,
November 1, 235,000,
" 2, 245,000,
" 3, 350,000,
" 4, 275,000,
" 5, 300,000,

721 Then we have no data until the 8th of November,—from the 5th to the 8th we have no data. Bacteria per cubic centimeter, November 8, 1,250,000,
November 9, 1,050,000,
" 10, 200,000,
Now then, there is a gap again in numbers until
November 17, 625,000,
Then it takes a dear little jump:
November 18, 5,180,000,
It drops on the 19th to 3,100,000,
November 20, 6,000,000,
" 21, 1,600,000,
" 22, 5,200,000,
" 23, 7,200,000,
" 24, 6,025,000,
" 25, 2,725,000.

Q. ATTORNEY GENERAL CROW: Now at what date there was the greatest number?

A. The greatest number recorded on this map is 7,200,000, on the 23rd of November. Now do you want those at Ruby Street Bridge?

Q. Well, they are the same figures?

A. No, no, the one at the Bear Trap Dam. Now the water tumbles over the Bear Trap Dam and mixes it with the Des Plaines River and pollutes it somewhat, so that we see the pollution in this graphic representation.

722 Q. All right.

A. 875,000 on the 26th of September. It tumbles to 75,000 on the 27th. Then on the 29th of September it is 225,000,

September 30, 1,250,000,
October 1, 25,000,
“ 2, 35,000,
“ 3, 325,000,
“ 4, 50,000,
“ 5, 350,000,
“ 6, 575,000,
“ 7, 245,000,
“ 8, 50,000,
“ 9, 50,000,
“ 10, 60,000,

Now then, we skip to the 12th,—25,000
October 13, 75,000,
“ 14, 85,000,
“ 15, 3,600,000,

Then it tumbles down,
October 16, 125,000,
“ 17, 50,000,
“ 18, 100,000,
“ 19, 85,000,
“ 20, 275,000,
“ 21, 65,000,
“ 22, 75,000,
723 October 23, 50,000,
“ 24, 125,000,
“ 25, 125,000,
“ 26, 650,000,
“ 27, 185,000,
“ 28, 1,025,000,
“ 29, 225,000,
“ 30, 325,000,
“ 31, 350,000,

November 1, 350,000,
“ 2, 625,000,
“ 3, 225,000,
“ 4, 150,000,
“ 5, 100,000,
Then we skip to the 8th, 150,000,
November 9, 400,000,
“ 10, 150,000,
Then we go to November 17, when we have 400,000,
November 18, 1,552,000,
“ 19, 1,700,000,
“ 20, 2,200,000,
“ 21, 3,500,000,
“ 22, 3,600,000,
“ 23, 3,200,000,
“ 24, 3,350,000,
“ 25, 2,650,000,

724 That is the last record on there. Now then we have that record,—the green line, for Brandon's Bridge.

Q. Where is Brandon's Bridge located?

A. Brandon's Bridge is five miles below Joliet. It is below a mixture of every stream and everything else that comes into the Des Plaines River.

Q. What does it show?

A. It shows a mixture of the Drainage Canal with the Des Plaines River; the Illinois and Michigan Canal with the Des Plaines River, and the sewage of Joliet.

It begins on the 27th of September, 350,000,
September 28, 375,000,
“ 29, 175,000,
“ 30, 325,000,
October 1, 75,000,
“ 2, 50,000,
“ 3, 325,000,
“ 4, 35,000,
“ 5, 350,000,
“ 6, 575,000,
“ 7, 245,000,
“ 8, 60,000,

October 9, 75,000,
" 10, 80,000,
Now then, we jump to the 12th, 25,000,
725 October 13, 65,000,
" 14, 80,000,
" 15, 3,650,000,
" 16, 125,000,
" 17, 50,000,
" 18, 100,000,
" 19, 90,000,
" 20, 275,000,
" 21, 60,000,
" 22, 65,000,
" 23, 60,000,
" 24, 135,000,
" 25, 125,000,
" 26, 650,000,
" 27, 175,000,
" 28, 1,025,000,
" 29, 200,000,
" 30, 325,000,
" 31, 350,000,
November 1, 325,000,
" 2, 625,000,
" 3, 225,000,
" 4, 150,000,
" 5, 100,000,
Then we jump to the 8th,—150,000,
November 9, 400,000,
726 November 10, 150,000,
Then we jump to the 17th of November, 400,000,
November 18, 1,525,000,
" 19, 5,700,000,
" 20, 2,175,000,
" 21, 3,500,000,
" 22, 3,600,000,
" 23, 3,175,000,
" 24, 3,350,000,
" 25, 2,650,000,
That is, on November 25th, this map is finished.

Q. ATTORNEY GENERAL CROW: Now, what periods of time does this map show these bacteria were the highest, and at what point?

A. They were the highest beginning the 17th of November, –there was a lapse between the 10th and 17th–

Q. On the 23rd?

A. No sir, beginning on the 17th and up until the 23rd, when they reached the highest; but they were still high on the 25th at all of these points.

Q. At what points?

A. At all these points?

Q. What points are they?

A. At Bear Trap Dam, Lockport, at Ruby Street Bridge and at Brandon's Bridge, Joliet.

727 Q. What point was the highest of all?

A. The Chicago Drainage Canal.

Q. Well, at what point on the canal?

A. The Bear Trap Dam, Chicago Drainage Canal.

Q. Is that where the Canal empties into the Des Plaines River?

A. Yes sir.

ATTORNEY GENERAL CROW: Now I wish to offer that map in evidence.

Said map received inevidence and marked "Complainant's Exhibit 11, Frank S. Bright, Commissioner."

Q. Now what is this chart I show you?

A. This chart is the result of daily quantitative determinations of the number of bacteria in samples of water collected at Peoria, Illinois, at Shady Beach, above the city.

Q. How far is that from the last collection in the map just preceding this one?

A. 120 miles.

Q. What is the period of time covered by that map?

A. October 1st to November 27th.

Q. Now explain the lines and the figures on that map.

A. The lines and figures on this map, beginning on the left hand margin show the number of bacteria per cubic centimeter, ranging from zero to 10,000,–those figures are in black,–bacteria per cubic centimeter. The river stages in feet are printed in red and range from zero to 10 feet. At the top margin

728 of the map are the dates from October 1st, consecutively to November 30. Do you want these lines (indicating).

Q. Yes.

A. The lines in red are river stages at this point from October 1st to November 28, while the dark line represents the bacteria per cubic centimeter.

Q. Now that represents then a stretch of river 120 miles in the Illinois River.

A. 120 miles in the Illinois River.

Q. Now just give the figures there of the—what it shows there for those dates with reference to the number of bacteria.

A. The number of bacteria at this point are, beginning October 1st, 2,325,

October 2, 2,500,
" 3, 1,750,

Now the next record I have got is October 5, 425,

October 6, 375,
October 7, 375,
" 8, 650,
" 9, 325,
" 10, 400—approximately,
" 11, 200,
" 12, 850,
" 13, 600,
" 14, 400,
" 15, 500,
729 October 16, 500,
" 17, 400,
" 18, 375,
" 19, 250,

Now then we jump to the 22nd,—300,

October 23, 400,
" 24, 350,

Now we jump to the 25th,—450,

October 27, 650,
" 28, 500,
" 29, 650,
" 30, 1,200,
" 31, 400,

November 1, 1,300,
“ 2, 700,
“ 3, 500,
“ 4, 400,

We jump then until the 6th, 500,

November 7, 300,
“ 8, 250,
“ 9, 450,
“ 10, 350,
“ 11, 375,
“ 12, 500,
“ 13, 2,450,
“ 14, 3,700,
730 “ 15, 3,000,
“ 16, 4,300,
“ 17, 6,500,
“ 18, 2,500,
“ 19, 1,800,
“ 20, 2,300,
“ 21, 1,300,
“ 22, 4,600,
“ 23, 9,000,
“ 24, 3,800,
“ 25, 2,700,
“ 26, 500,
“ 27, 1,900.

Q. Now, what period of time is it shown by that map that at Peoria, 125 miles below where the last examination was made, that the number of bacteria was the greatest?

A. There was a decided and rapid rise from November 13th to November 17th; then it dropped until November 21, and then a rapid rise on November 23 to 9,000, and then a drop for the 26th to 500.

Q. How does that correspond with the increase as shown on the map at a point 120 miles above on the Illinois river?

A. It seems to correspond with the rise and fall of bacteria at Bear Trap Dam, Ruby street and Brandon's bridge at Joliet.

Q. Now, at this point in the river, the current is less than at any other place in the Illinois river?

A. No, I won't say that, but it is below what is called Peoria Lake, the river widens out into a lake above Peoria, and flows quite slowly, but we haven't said anything about the stage of the river.

Q. What was the stage of the river during that period?

A. During this period, the stage of the river remained remarkably even throughout, and when the bacteria was so high, for the two periods in November, the water was a little bit lower than it had been for previous weeks. Beginning October 1st, it was 6.2 feet.

October 2, 6.2 feet,
" 3, 6.2 feet,
" 4, 6.2 feet,
" 5, 6.1 feet,
" 7, 6 feet,
" 8, 5.9 feet,
" 9, 5.9 feet,
" 10, 6 feet,
" 11, 6 feet,
" 12, 6.1 feet,
" 13, 6.1 feet,
" 14, 6.1 feet,
" 15, 6.1 feet,
" 16, 6.1 feet,
732 " 17, 6.1 feet,
" 18, 6.1 feet,
" 19, 6.1 feet,
" 20, 6.1 feet,
" 21, 6.1 feet,
" 22, 6.2 feet,
" 23, 6.2 feet,
" 24, 6.2 feet,
" 25, 6.2 feet,
" 26, 6.2 feet,
" 27, 6.2 feet,
" 28, 6.2 feet,
" 29, 6.2 feet,
" 30, 6.2 feet,
" 31, 6.2 feet,

November 1, 6.2 feet,
“ 2, 6.4 feet,
“ 3, 6.4 feet,
“ 4, 6.4 feet,
“ 5, 6.4 feet,
“ 6, 6.3 feet,
“ 7, 6.3 feet,
“ 8, 6.3 feet,
“ 9, 6.3 feet,
“ 10, 6.3 feet,
“ 11, 6.3 feet,
733 “ 12, 6.4 feet,
“ 13, 6.4 feet,
“ 14, 6.4 feet,
“ 15, 6.4 feet,
“ 16, 6.4 feet,
“ 17, 6.3 feet,
“ 18, 6.3 feet,
“ 19, 6.3 feet,
“ 20, 6.3 feet,
“ 21, 6.3 feet,
“ 22, 6.3 feet,
“ 23, 6.3 feet,
“ 24, 6.4 feet,
“ 25, 6.5 feet,
“ 26, 6.5 feet,
“ 27, 6.5 feet,
“ 28, 6.5 feet.

You see the river fluctuated an inch or two only.

Q. Now, with reference to the increase of bacteria there, what is indicated, if anything, bacteriologically by the even stage of the water during the period and at the place mentioned?

A. The river remained stationary practically during this period from October 1st to November 29. In any ordinary river the bacteria would have remained practically stationary, but in the dates as given before, you find a remarkable
734 rise without any rise in the river.

Q. Well, what does that indicate, if anything?

A. It indicates that large numbers of bacteria put in above apparently came through to Peoria.

Q. Now, above the Bear Trap Dam, in the Des Plaines river, have you any analyses of that water?

A. Yes, that has already been submitted.

Q. Now, you have investigated those analyses, have you?

A. Yes, sir.

Q. What does it show, a larger or smaller number of bacteria above the Bear Trap Dam than it does below?

A. Oh, a very small number, comparatively.

Q. Is there any other place than the Chicago Canal at the Bear Trap Dam from whence this large number could come into this river at this stage of the water?

A. None that I know of.

Q. Have you got the rain precipitation in that tributary of that river for that period?

A. I have.

Q. Where is that?

A. It is in my government reports which I have downstairs. There was no precipitation practically in that area at that time.

Q. There was not?

A. No.

735 Q. Well, we will get those charts.

A. We will get those charts and introduce them.

Q. Now, is there anything else you want to say about that map?

A. No, I think everything is written on it.

ATTORNEY-GENERAL CROW: I will offer that map in evidence.

Said map received in evidence, and marked by the Commissioner "Complainant's Exhibit 12. Frank S. Bright, Commissioner."

Q. Now, what is this map I show you?

A. This map is made up from results of the daily quantitative determination of the number of bacteria in samples of water collected from the Illinois river at Grafton, Illinois, from October 1st to November 27th, 1901.

Q. Now, how far below Peoria is the point at which this map was made?

A. I think it is 163 miles.

Q. By river?

A. By river.

Q. Do you know the fall of the river, the mean fall of the river between Peoria and Grafton?

A. I remember that it is thirteen feet.

Q. Thirteen feet, well, about that, in the neighborhood of that, is it?

A. Yes, sir.

Q. Now, you just indicate to us what the figures and the
736 lines on that map mean?

A. The figures on the right hand margin are the bacteria per cubic centimeter, ranging from zero to 10,000, and written in black ink. In the next column are the stages of the river in feet, running from zero to 4.5 feet. At the top of the map we have the point, Illinois river at Grafton, together with the months of October and November, and the dates running from October 1st, consecutively, to November 29, 1901.

Q. This is for the third period? Well, now, what do the cross lines indicate?

A. The cross lines indicate first those in black indicate the bacteria per cubic centimeter taken daily at this point, and the red lines the stages of the river.

Q. Now, at what period of time there was the greatest number of bacteria found per cubic centimeter?

A. 17th of November.

Q. 17th of November, 1901?

A. Yes, sir.

Q. Now, what is the stage of the river on the 17th of November here as to being the highest or the lowest during the period October 1st to November 27, 1901?

A. There was a slight rise at that date, but it was not as high as it had been at a previous period—from October 21 to October 30th, the stage of the river was 4.2 feet, while at the period when it was the highest here—

737 Q. When the river was the highest?

A. No, when the bacteria were the highest, the stage of the river was 3.5 feet and 3.7 feet.

Q. Now, when the river was highest, what was the number of bacteria?

A. The number of bacteria at a high point here, was 34,000 at that period.

Q. Now, what was the period you mentioned there, what is that period?

A. On the 17th of November.

Q. On the 17th of November, what was the number of bacteria?

A. 9,000.

Q. And the river was how many feet lower then than it was on this date here—what date is that?

A. That date is the 29th of October.

Q. 29th of October?

A. Yes, sir; and the difference in the stage of the river there was the difference between 3.7 feet and 4.2 feet.

Q. Well, that is seven inches?

A. No, seven-tenths of a foot.

Q. Then the river was seven inches lower when the greatest number was found?

A. Yes, sir, 3.7 feet, and the other was 4.2 feet. It would be a difference of five-tenths of a foot.

Q. Yes, it is five tenths. Now, do you remember the rain precipitation during that period?

738 A. I don't from memory; I have that in the charts.

Q. Well, we will get that and put it in a little later.

A. Yes.

Q. Is there anything else you want to say about that map?

A. No, sir.

ATTORNEY-GENERAL CROW: I will offer that map in evidence.

Said map received in evidence and marked by the Commissioner. "Complainant's Exhibit No. 13. Frank S. Bright, Commissioner."

Q. And the river was how many feet lower than it was on the 27th of October?

A. I said five-tenths of a foot; that is a half a foot—six inches lower.

Q. You have read the subject of bacteriology with reference to the sanitary supplies of waters for towns, cities, villages, etc., have you?

A. Yes, sir, I have lectured on hygiene for a number of years.

Q. Whereabouts?

A. Medical Department, Washington University, St. Louis.

Q. Now, you are acquainted with the conditions that are required for sanitary water for primary purposes, that is for domestic use, such as drinking, cooking, etc.?

A. Yes, sir.

Q. You are also acquainted with the history of the examinations of the conditions surrounding the sanitary supplies of different cities of the world, as connected with epidemics of typhoid fever and cholera? 739

A. Yes, sir.

Q. Now were you ever at a place called Lausen, in Switzerland?

A. Yes, sir.

Q. Where is that place located?

A. That is near Basle, about fifteen miles from it.

Q. Is it on a stream?

A. Yes, there is a small brook that runs by it, in a gulch.

Q. Were you there as a bacteriologist and hygiene expert?

A. Yes, that is, I was there as a hygienist sanitarian.

Q. Now, you examined this town and the waters surrounding it?

A. Yes, sir, it is one of the classic typhoid epidemics of the world in the literature.

Q. Well, now, just describe how the town is located?

A. It was—I was at Basle in 1896, and took a ride down to this small place; there is a railroad runs through it.

Q. That is in Switzerland?

A. Yes, sir, that is in Switzerland—and it is classic—

Q. How is it located, the town?

A. It is in the mountains.

Q. On the mountain or in the valley?

A. No, sir, it is in the valley; it is at the foot of Stockholen.

Q. What does that mean?

740 A. Oh, it is the name, like your name, like my name; it is the name of a mountain. At the foot of this mountain there is a spring, and that spring is enclosed and pipes lead from it and supply the town with water; that is it is led into several fountains that are along the street and to these fountains the people go and get their drinking water.

Q. How large a town is that?

A. The town contains 90 houses, and about 700 people.

Q. That is about the size of it when you were there?

A. Yes, when I saw it; it was quite a prosperous little town.

Q. Now, have you any knowledge of the great epidemic of typhoid fever that occurred there, and when it occurred?

A. I know that it occurred in August, in 1872, and was investigated by Dr. Haegler. He lived at Basle; he went there and investigated this epidemic after it occurred.

The water from this spring that I speak of, conducted through these pipes to the fountains in the town, was the source of the drinking water for the greater part of the inhabitants of the town. Some had shallow wells connected with their homes and took water from them, a few families, but the great majority of the population took their water from the fountains from that spring. On the other side of this mountain there is a village and there is a little brook called the Fuerlen. This little brook empties into a larger stream below Lausen.

741 In, I think it was in August—August 7th, or about that time, 1872, the first cases of typhoid fever occurred in Lausen. Within a very short period—within a few weeks, 140 cases occurred, with eight fatalities.

In the investigation it was found that the Fuerlen brook at one time had been discharged into an opening in the mountain a little bit lower down than its natural drainage bed, and that this water, or rather that the water in the spring at Lausen had become slightly turbid, and the in-flow had increased very greatly. After a time this brook was again confined to its course, and the hole that had appeared in the side of the mountain was filled up. I should say this brook was used in the summer time for irrigating or watering the fields—the brook was turned in on a field for irrigation purposes; that had been a yearly affair.

In June, a man had typhoid fever in that region, and his wife and daughter, I believe, and a girl, and from June until August their discharges were thrown into the Fuerlen brook, and the Fuerlen brook was used for irrigating this field, and ran down into this old hole in the mountain and down into the brook, which before this typhoid fever broke out, was turbid, that is, the water of the spring, I should say, that supplied the water to Lausen, was turbid. Following that came this typhoid epidemic. Dr. Haegler undertook to discover whether the water passed down through this mountain or not to the spring below.

742 He put quite a number of pounds of salt something like 1,800 pounds at first and at a later time 5,000 pounds of salt, in the hole, and the salt—chloride of sodium was easily detected in the water flowing from the spring below. He also emptied quite a number of hundreds of pounds of flour into this hole, but none of it came through; there were no starch particles detected in the water at the spring, the source of this water supply of Lausen. It may be said there had been no typhoid fever in that district for some sixty years before.

ATTORNEY-GENERAL HAMLIN: What is the purpose of this examination?

ATTORNEY-GENERAL CROW: Well, the doctor visited that point, Lausen, Switzerland, as a scientist, a hygienist and also as a bacteriologists. I wanted to qualify him as an expert on the proposition. I have asked him what he knows of the history of this epidemic at this place, for the purpose of showing the manner in which it has been demonstrated that the typhoid bacillus will travel.

JUDGE SPRINGER: How far did it go?

A. It went through the mountain, about a mile and affected the spring at its base—at the base of this mountain, and this mountain acted as a filter sufficiently good to keep out starchy particles of flour, but it was too porous to keep out, apparently, the typhoid bacillus. This spring is enclosed; the spring is in an enclosed space; it is not open at all.

743 Q. ATTORNEY-GENERAL CROW: Have you ever been at Plymouth, Pennsylvania?

A. No, sir, never been there.

Q. As a bacteriologist are you acquainted with the epidemic of typhoid fever and its causes at that place?

A. Well, I am acquainted with the literature on the subject, and the report that was made to the Pennsylvania State Board of Health and published by them.

Q. When did that occur, do you know?

A. 1885.

Q. Do you know what was the occasion of it?

A. Well, it was—the investigators came to the conclusion that it was due to the discharges of a typhoid fever patient that were thrown upon the bank of the reservoir that was the source of the water supply of this town.

Q. Do you know how many cases there were there?

A. There were 1,104 cases.

Q. How large was this town?

A. Eight thousand.

Q. Are you acquainted with the investigations made by Dr. Sedgwick, at Lowell, Lawrence and Newburyport on the Merrimac river in the state of Massachusetts, in 1891, 1892 and 1893?

A. I am acquainted with the reports of the State Board of Health of Massachusetts and of his writings on the epidemic.

Q. What is supposed to have been the cause of those epidemics?

744 A. Well, that has been very vigorously discussed. It seems that discharges from some typhoid fever cases were emptied into Stony Brook, above the water supply, about three or four miles from the Intake—

Q. Well, what was the result of that epidemic at that place?

A. I don't remember from memory.

ATTORNEY-GENERAL HAMLIN: I believe I will enter an objection to this testimony as not being relevant to the issues, and not competent.

ATTORNEY-GENERAL CROW: For the reason that the man that investigated it is not testifying?

ATTORNEY-GENERAL HAMLIN: Well, that is not the only reason. We are going to get an awful record here if we get all the literature of all the cases. Still, you can pursue your own course; I will enter the objection.

THE COMMISSIONER: Just note the objection.

Q. GENERAL CROW: Do you know how many cases there were reported in 1896, at the town of Lawrence, Massachusetts?

A. I don't from memory.

Q. Do you know what caused that epidemic?

A. The epidemic was due to dejecta, at least ascribed to dejecta of typhoid fever patients getting into the water supply and being drank by these people.

Q. Whereabouts in the water supply did it go; do you know where the town got its water from?

A. Merrimac river.

745 Q. Was there any experiment made to determine the question as to whether or not it was in the Merrimac river?

A. I think so; I think Dr. Sedgewick carried out some experiments, but I am not positive about that.

Q. Is typhoid fever more prevalent in the winter or in the summer months?

A. In the fall, fall and early winter, as a rule.

Q. Does the movement, or the flow of the water, the speed of it, have anything to do with the danger to be apprehended from the injurious germs of bacteria in the water?

A. Yes, sir.

Q. In what way?

A. The faster the water flows, the further it will carry bacteria.

Q. Well, then, in slow flowing waters, what is the result?

A. In waters that flow very slowly, or are stagnant, or still, the bacteria are precipitated into the silt or slush at the bottom of the river—

Q. Now, does the slow speed of the river, or the fast speed of the river destroy the bacteria?

A. No, sir.

Q. Does the volume of water, whether large or small, destroy the bacteria?

A. No, sir. That is, you are speaking about any particular bacillus—you are speaking about a typhoid bacillus?

Q. Yes, sir.

746 A. No, sir.

Q. Now, is there any difference in the conditions surrounding the typhoid bacillus in sterilized water in a bottle, and the ordinary tap water in this city, or the ordinary water taken from the In-take tower of the Mississippi river—

A. Yes, sir.

Q. Wait until I get through with my question—and the condition that would surround that same bacillus if it were alive and in the flowing waters of the Mississippi river?

A. Yes, sir, the differences are very great in a steriled water. Do you mean a steriled water or a distilled water?

Q. I mean sterilized water.

A. A water that has been sterilized by heat contains the inorganic matter of the water, but the bacteria have been destroyed in it. It still has food for bacteria, and it has no other bacteria. Now, the typhoid bacilli put into that water have no other form of organic life to contend with, and in my experience, and I think in the experience of all bacteriologists, the bacteria will live a great deal longer in sterilized water of a district than they do in the living water of that district in a bottle.

Q. Now, how long did they live, you say?

A. Sixty days, sir; I have some tables showing that.

Q. Well, they have been introduced?

A. Those tables have not been introduced.

Q. Well, just get them, and we will put them in the record
747 right now.

A. We have another, a second period, the longevity of the life of the bacillus typhosus in sterilized waters,—distilled first. Now the environments, the surroundings—take distilled water in total darkness at ten degrees centigrade,—experiments A, B, and C, here, three different cultures, 51 days, 25 days and 22 days.

Q. With the same surroundings?

A. With the same surroundings; they were in darkness, in an ice chest, against the ice, with a temperature there of 10 degrees centigrade, and the three different cultures were used, and they lived 51 days, 25 days and 22 days. That is in distilled water. Now, that is pure water, the artificial product of the laboratory.

Now the Mississippi River water at Grafton, in total darkness, ten degrees centigrade—

Q. That is 25 degrees Fahrenheit?

A. Yes, about 25.

JUDGE SPRINGER: It must be above freezing.

THE WITNESS: It is above 32. Lived 59 days for the first culture and for the third culture "C" 40 days. "B" not recorded.

Illinois River, Lockport,—that is wrong,—that ought to be the Drainage Canal water, Lockport.

Drainage Canal water, Lockport, Illinois, in total darkness, ten degrees centigrade, 50 degrees Fahrenheit, lived 45
748 days, "A" culture, "B" not recorded. "C" 22 days.

Missouri River water, Bellefontaine, sample collected at Bellefontaine, lived in total darkness, ten degrees centigrade, —50 degrees Fahrenheit, 59 days; B 57 days; C. 57 days.

Mississippi River, Intake, water, total darkness, 10 degrees centigrade, lived:

A culture, 59 days,
B culture, 59 days,
C culture, 34 days,

Distilled water, total darkness, at 20 degrees Centigrade, which is 68 Fahrenheit, in distilled water; A culture lived 22 days; B culture 54 days; C culture 30 days.

Mississippi River water, Grafton, total darkness, twenty degrees Centigrade, 68 Fahrenheit:

A culture, not recorded,
C culture not recorded,
B culture, 37 days.

Drainage canal, Lockport, Illinois, in total darkness 68 degrees Fahrenheit; 20 degrees Centigrade,

A culture lived 54 days,
B culture lived 54 days,

Missouri River, Bellefontaine, sample collected:

C culture lived 57 days; the other two not recorded.

749 Mississippi River, Intake water,

A culture lived 54 days,
B culture, lived 55 days,
C culture 54 days.

Distilled water, open window, facing east; it was in the middle of the window, facing east, and the sun was on it all morning, 100 cubic centimeters in a bottle. Distilled water, open window, months of July August and September, 1900. Distilled water 22 days, A culture; B culture 25 days; C culture 45 days.

Mississippi River, Grafton:
B culture 45 days,
C culture 60 days,
A culture not recorded.

Drainage Canal water, Lockport,
A culture lived 40 days,
B culture lived 31 days,
C culture lived 22 days.

Missouri River water, Bellefontaine, open window. All of these are open window now. This is not recorded.

Mississippi River, Intake tower:
B culture lived 46 days,
C culture lived 45 days,
A culture not recorded.

Where you have "not recorded" I see there is a cross; that cross refers to the lower part of the page where it says
750 "Still living at the end of 65 days."

These experimnets were conducted by Mr. C. A. Snodgrass, with the assistance of Mr. Johnson, Dr. Kirchner and myself.

Q. At what place?

A. At the Bacteriological laboratory old City Hall.

Q. St. Louis?

A. St. Louis, yes sir.

Q. That is all the experiments you have as to the longevity of this bacillus?

A. Oh no, that is the longevity of the bacillus in steriled water.

Q. Now the natural water; have you got the result of the experiments in that?

A. Yes sir. Now in connection with these experiments, I would like to record the facts, before introducing the third table, because this is a very much more complicated and difficult procedure than the other. The one recorded is simply of a man taking some water out of the river, sterilizing and using ordinary care that bacteria from the air do not get into the water.

Sufficient evidence having been obtained in the second period of the determination of the longevity the typhoid bacillus in steriled waters, a series of experiments were conducted in June, July, August, 1901, by myself, assisted by Mr. George M.

Ravold, to determine the length of life of the bacillus—

751 ATTORNEY-GENERAL HAMLIN: The first part of the answer is objected to, that sufficient evidence having been obtained, etc., down to the point where he commenced to state "A series of experiments," etc.

THE COMMISSIONER: Note that objection.

ATTORNEY GENERAL CROW: Just strike that out.

A. A series of experiments were conducted in June, July and August, 1901, by myself, Dr. Amand Ravold, assisted by Mr. George M. Ravold, as medium maker, to determine the length of life of the bacillus typhosus in samples of living water from the Chicago River, Chicago Drainage Canal, at Lockport, Illinois; Illinois River at Peoria; Mississippi River at the Intake.

Plan of procedure. Samples of water were collected at different times from the above points, and 200 cubic centimeters poured into sterilized Erlemeyer flasks, and corked with cotton stoppers. Some were exposed to sunlight, others kept in darkness at a temperature of about 16 degrees Centigrade,—60.8 Fahrenheit. Those exposed to sunlight were placed on a shelf in a window facing south, and the direct rays of the sun impinged full upon the western flask in the window, at 10:45 A. M., and left the flask furtherest east at 2:15 P. M. The total time of exposure daily being about three hours, approximately, and I have that in another table, upon which is recorded a table showing the hours of sunshine in the month of July, temperature of the water in the flask recorded daily at 10:00

752 A. M., and 2 P. M. I would like to record that all samples from Illinois River, Peoria, Pekin and laboratory tap, were turbid. Here is the table of sunshine—

ATTORNEY GENERAL CROW: You have no objection to the sunshine going into the record, have you?

A. It is important to the bacteriologists, to know how much sunshine they get.

JUDGE SPRINGER: The more sunshine the less bacteria.

A. Well, yes; then we have got the weather conditions and the number of hours of direct sunshine.

ATTORNEY GENERAL CROW: Then we will just insert that here.

The table is in words and figures as follows:

Date.	Temperature in Window.	
1902.	11. A. M.	2. P. M.
July 7,	36 c.	39 c.
“ 8,	36	38
“ 9,	34	39
“ 10,	24	36

July 31,	"	"	2.30	

A series of trials—just simply say a number of trials were made with a number of special media for the purpose of finding the medium on which the typhoid bacillus would grow best, and we finally adopted two—Hiss' medium and Elsner's medium, prepared according to the following method—do you want to hear these methods?

Q. No, just in the usual manner.

A. No, it is not made in the usual manner; this is entirely original.

755 Q. Well then, just put it in.

A. Do you want to say that you will just simply enter into the record, or would you rather have me read this interesting thing?

ATTORNEY GENERAL HAMLIN: Yes, if it is different from what we have struck we want to know how.

A. We clean and scrape 1,000 grams of Potato, allowed to stand over night in a refrigerator; press out all juice in a meat press the next morning, filter while cold, through an absorbent cotton filter, and boil for five minutes. Filter through a cotton filter, titrate—The reaction should be three per cent acid to phenol phthalein; if too acid, enough water is added to make the reaction three per cent. If less than three per cent, evaporate until the required reaction is obtained. Add ten per cent gelatine and one per cent of potassium iodide. The gelatine is acid and will increase the acidity of the medium. Enough caustic soda is added to overcome the acid reaction of the gelatine and

leave the medium three per cent acid, titrate, and when proper reaction is obtained, heat in a water bath at boiling temperature three quarters of an hour; filter and allow to stand in a funnel over night in a refrigerator. In the morning cut off the sediment which has sedimented. Heat the filter tube
756 and sterilize for twenty minutes three days in succession, at 100 degrees centigrade. Into each flask of living water three loop-fuls of a typhoid growth on slant agar were sown, care being taken to remove none of the nutritive medium, in lifting off the growth, Elsner's medium, although the more difficult to prepare, was preferred, because of the distinctive character of the typhoid colonies upon it, besides it seemed to inhibit the growth of the number of saprophytic water bacteria. Every day one cubid centimeter of the inoculated water was plated in both Hiss and Elsner media. Hiss plates were incubated at 37 degrees Centigrade, for twenty-four hours and the Elsner's plates at 20 degrees centigrade for from two to four days. At the end of that time colonies were picked off on slant agar and inoculated. After twenty-four hours incubation the slant agar growth was studied for purity of culture, and if pure sown in broth, litmus milk and glucose agar. The growth in the broth culture was submitted to the Widal test after the following method: The blood serum used in this work came from the City Hospital through the kindness of Dr. W. C. G. Kirchner, and the blood was kept cold for several days, the serum bipetted off and dried on glass slides; it was discovered that quite a number of motile water bacteria agglutinated in this serum in dilutions as high as one to thirty. On
757 this account a series of tests were made with the dried serum, definite quantities weighed and mixed with normal salt solution in varying proportions, and it was found that in a dilution of one to one hundred and fifty, both the Wesbrook and Kirchner cultures would agglutinate firmly in one hour at 37 degrees centigrade. The Wesbrook and the Kirchner typhoid cultures,—two distinct cultures were used in the conduct of these tests. All suspected bacilli picked off the plates were made to conform to this test. Dilutions of one to one hundred and fifty in one hour at 37 degrees centigrade, otherwise rejected. The typhoid culture used in these experiments were number 1 from Dr. Wesbrook of the University of Minnesota,

said to have been found by him in the waters of the Mississippi River at Minneapolis, No. 2 came from a spleen sent in by Dr. W. C. G. Kirschner from a patient dead of typhoid fever at the City Hospital, and separated out in this laboratory July 8, 1902. It will be noted that the results of the two cultures are practically the same, in the following table—do you want to put the table in evidence?

Q. If you have nothing else to say about it; indicate what it is—what kind of water and where it is at?

A. This is all recorded here. The third period, 1901,
758 Longevity of the typhoid fever bacillus,—bacillus typhosus. Sample inoculated with the bacillus typhosus; the location is given, it is either in the window or in the ice chest. That is also recorded as we go down. Now first in the window, Illinois and Michigan Canal, Lockport, July 5, number of days that the bacillus lived was five. Drainage canal, Western Avenue, Chicago, Illinois, June 13th, longevity five days.

July 15, seven days.

Drainage Canal, Lockport, June 13th, four days.

July 5, eight days.

Illinois River above Peoria, June 13th, five days.

July 5th, ten days.

Illinois River, Pekin—

ATTORNEY GENERAL HAMLIN: Is the sun shining?

A. Yes, this is open window, sunshine.

July 11, eight days.

Illinois River Bridge, Pekin, June 13th, four days.

July 5th, ten days,

Chicago River, Adams Street, June 13th, four days.

Tap in the laboratory, St. Louis, June 13th, seven days.

Tap in the laboratory, St. Louis—

759 ATTORNEY GENERAL HAMLIN: This is all in 1901?

A. 1901. Tap in the laboratory, St. Louis, sample inoculated July 13th, lived twenty-four hours.

Chicago River, Adams Street, July 5th to 21st; water sample sterilized, the bottle was broken accidentally. On the 16th day the bacteria were still alive.

July 5th it lived sixteen days—or the bottle was broken on the sixteenth day. This is in the refrigerator. Temperature sixteen degrees Centigrade.

Drainage Canal, Western Avenue, June 13th, seven days.

July 5th, eight days.

Drainage Canal, Lockport, July 5th, ten days.

Drainage Canal, above the controlling works, Lockport, June 13th, lived nine days.

Illinois River, above Peoria, June 13th, ten days.

July 5th, thirteen days,

Illinois River water, Pekin, June 13th, eight days.

July 5th, twenty-one days;

July 17th, sixteen days,

Chicago River, Adams Street, June 13th, four days;

July 5th, seven days,

Tap in the laboratory, St. Louis, June 13th, twelve
760 days.

Tap in the laboratory, St. Louis, June 13, exposed to direct sunshine all day, in 100 degrees centigrade, flask lived twenty-four hours.

Q. ATTORNEY GENERAL CROW: That is 100 cubic centimeters.

A. One hundred cubic centimeters.

Chicago River, Adams Street, in sterilized water, July 5th, 23 days.

We have some for Drainage Canal, Lockport, July 17th, eleven days.

Drainage Canal, Jackson Street, Joliet, for July 17th, thirteen days.

Illinois River, Bridge, at Pekin, for July 17th, sixteen days.

Now the average number of days alive in the window we have two columns here, one in the window and one in the refrigerator.

Q. This is in what kind of water?

A. This is in the sterilized water.

Q. Well, in the natural water?

A. In the natural water. Illinois and Michigan Canal, Lockport, average number of days alive, five, in the window; no record in the refrigerator.

761 Drainage Canal, Western Avenue. In the window, six days; in the refrigerator seven and one-half days.

Drainage Canal, Lockport, in the window four and three-fourths days; in the refrigerator ten and two-thirds days.

Drainage Canal above controlling works, Lockport, average number of days alive in the refrigerator nine days.

Drainage Canal, Jackson Street, Joliet, average number of days alive in the window, nine days, and in the refrigerator thirteen days.

Illinois River above Peoria, average number of days alive in the window seven and two-thirds days; in the refrigerator eleven and one-half days.

Illinois River water, Pekin, in the window, seven days. In the refrigerator fifteen days.

Chicago River, Adams Street, in the window, four days; in the refrigerator, five and one-half.

Tap in the laboratory, St. Louis, seven days in the window and twelve days in the refrigerator.

Chicago River, Adams Street—this is now sterilized water, average number of days in the window, sixteen days.

Drainage Canal, Lockport, average number of days alive in the refrigerator, 23.

I have the averages of the results in the steriled waters for the period of 1900, if you care to put that in.

762 Q. Of the typhoid bacillus?

A. Yes, for the 1900 period.

Q. Beginning in January and ending in October?

A. No, that was in June, July and August.

Q. Where did you get that culture from?

A. That culture was a culture obtained from Dr. Wyatt Johnson of,—I think he is at Montreal; he was at Montreal, Canada.

Q. You can put that in there if you want to?

A. I have given you the average number of days. I will give you the days, yes sir, but the average is also worked out here.

Q. Well, give us the average, that is for 1900, is it.

A. Yes sir.

Q. These are all laboratory experiments?

A. Yes sir. Above results average allowing the period of

65 days for this culture life when this work stopped, would be as follows:

Average of results, conditions of light and temperature—there are two columns here, the first one is at ten degrees centigrade, and the second one at 20 degrees centigrade. That was in total darkness. Then one at the open window.

First, sterilized distilled water, and the number at ten
763 degrees Centigrade, was, "A" lived 33 days; B 35 days;
C 31 days.

Sterilized Mississippi River water, from Grafton, A 55 days; B 52 days; C 57 days.

Sterilized Illinois River water, Lockport, A culture 44 days; B culture 58 days; C culture 31 days.

Sterilized Missouri River water, Bellefontaine, A culture 55 days; B, 62 days, C, 65 days.

Sterilized Mississippi River water at the Intake, A culture 51 days; B culture 54 days; C culture 52 days.

Q. Now doctor, these are all laboratory experiments?

A. Yes sir.

Q. Now are conditions favorable or unfavorable for the longevity of bacilli of any kind in a laboratory experiment, either in sterilized or non-sterilized waters, or the natural waters?

A. Well from those results, they would seem to be favorable, in the sterilized waters and unfavorable in the stagnant living water in the bottle.

Q. Now compared with the conditions in a running stream, or living water, Illinois River, Missouri River or the Mississippi
River, where oxidation is taking place and full of organic,
764 animal and vegetable substances, would the conditions for
longevity for typhoid bacillus be greater than it would be in any laboratory experiments, what would you say about that as a bacteriologist?

A. It is impossible to carry out in a laboratory experiment the conditions which obtain in a running stream, but the conditions in a living water in a flask in a laboratory experiment, the bacteria are there in evidence, all the bacteria in that particular water each of which produces a particular toxin or toxins, which is either favorable to or deleterious to the life of the typhoid bacillus also the contained infusorial life, so that in a flask in the living water in a very short time the toxins produced by the micro-organisms that are at work, seem to act unfavorbly upon the typhoid bacillus placed in that water. In steriled water, the typhoid lives, you see, quite a number of days. Now what obtains in a running stream would seem to be this, that the typhoid bacillus would not be subjected to the poisons produced by other bacteria, so much as it would be in the stagnant water in a flask. In the running stream it certainly would not be confined to a given water; because it can swim about and also be carried along by the running stream, so that its chances of prolonged life would be, it seems to me, vastly greater.

Q. Well is there more or less food supply for bacteria in the running water?

765 A. I don't see where that cuts any figure in these experiments. I find that in steriled, distilled water, the typhoid bacillus lives for a long time. There is no assertion here made that the typhus bacillus lives and multiplies in the water. It simply remains dormant until its life history is over, unless in the meanwhile it reaches a favorable condition, for growth and multiplication.

Q. The death of the typhoid bacillus in running water is due to toxins produced by bacteriological conditions that exist there?

A. I don't know that.

Q. How is it in water, in a bottle?

A. I think so.

Q. You think it is?

A. Yes sir.

Q. Well, is there anything that leads you to believe from your experiments as a bacteriologist, that any other cause, produces its death in the running water?

A. It lives out its period and dies after a time.

Q. Is its period of longevity definitely known in running water?

A. No sir.

Q. Is it possible to ascertain that?

A. Well, I have been racking my brains for two or three

766 years to try to devise a scheme for ascertaining its longevity in running water, but I have never succeeded yet; however it never has been done.

Q. I say, up to this time,—up to this time bacteriologically it has not been found how long bacilli will live in running water.

A. No sir, not in a running stream.

Q. The distance they would be carried, according to what men know of the longevity now, from bacteriological experiments, would depend entirely on the rapidity of the flow of the stream?

A. Yes, sir.

Q. In the flood tide of the Illinois and Mississippi rivers, if typhoid bacilli came down from the Chicago river and emptied it in the Illinois river, they would come into the Intake tower much more rapidly than they would if the waters were low?

A. Yes, sir.

Q. Now, do you know from your own knowledge anything about how long it takes, water to come from the dam at Lockport or from the canal there in Chicago, the Chicago river, down to the City of St. Louis?

A. I do not. AMAND N. RAVOLD.

Adjourned until ten o'clock following morning, Thursday, February 26, 1903.

Southern Hotel, St. Louis, Missouri,
767 10:00 A. M., February 26th, 1903.
Continuation pursuant to adjournment.

Present, the Commissioner, and same counsel representing the respective parties.

By consent of counsel on both sides, Dr. Amand N. Ranvold is withdrawn from the stand, and the State of Missouri, the Complainant, by Attorney General Crow of Missouri, proceeds to examine

BENNEZETTE WILLIAMS, who

called as a witness in behalf of the complainant, after being first duly sworn by the Commissioner, testified as follows:

DIRECT-EXAMINATION,

By Attorney General Crow.

Q. What is your name?

A. Benezette Williams.

Q. Now, Mr. Williams, where do you reside?

A. I reside near Chicago. My business is in Chicago.

Q. What is your occupation?

A. My occupation is civil engineer and consulting engineer.

Q. How long have you been residing in Chicago?

768 A. For thirty years.

Q. How long have you been following your profesion?

A. About thirty, thirty-one or thirty-two years.

Q. Are you familiar with the geography and the location of the City of Chicago?

A. I am very familiar with it.

Q. Will you just describe the geographical condition there of Chicago, with reference to the Lake and the Chicago River and also the geographical condition of the Chicago River with reference to the City.

A. The geographical condition can best be shown by the map, but the topographical condition—

Q. Perhaps that is what I mean.

A. Chicago lies very low. The elevations of the ground within the city of Chicago with perhaps, but one minor exception, you may say, is from the lake level to a height of about 25 feet above the lake level, and a very large portion of the city lying but a few feet above the lake level, both the old central portion of the city and other portions, so that the process has been in the settled parts of the city, to raise the grades in order to get the depth to cover their sewers, and to get sufficiently out of the mire, you might say. That is to fill the streets
and raise the grade of the street above the original surface
769 of the ground. In other portions of the city they are over-
coming that difficulty now by building sewer districts; building the sewers in districts and pumping the sewage. That is, they build sewers below the lake level and pump a flow.

Q. What do you mean by pumping a flow?

A. Well they put in pumps at the outlet of the sewer and pump the sewer.

Q. Pump the sewer back to the lake level?

A. To the lake level or to a point of discharge.

Q. What is the original character of the principal portion of the soil on which the city of Chicago is built, with reference to whether it is soft, or marshy or firm foundation?

A. It is reasonably firm soil. The greater portion of the City of Chicago is clay soil, overlaid of course with prairie soil originally.

Q. What is the character of that; is it a loamy soil?

A. A soft, loamy soil.

Q. Free of stone?

A. Yes, free of stone.

Q. Any gravel?

A. No gravel in the surface of loamy soil. You find stone in the underlying clay. It has a glacial portion. Clay has what we term a glacial portion, and it is more or less filled with stone; that is boulders in size sometimes larger and sometimes 770 cobble stone size, and a gravel material to a greater or less extent. In some places you will find this clay quite pure, with very little of that with it. In other places you will find almost a complete mass of boulders cemented together with clay; then another portion of the city lying directly along the lake at a certain depth consists of this same clay, but it is overlaid with a sand ridge, a ridge has been formed by the flowing up of the lake and the washing and blowing of the sand into the ridges. That is close to the lake, however, and none of that occurs at much distance from the lake.

Q. What proportion of the surface of the city limits of the City of Chicago is on the lake level or below the lake level?

A. Well, but a small portion is as low as that, but there are a great many square miles that are so low that you have to pump in order to get drainage.

Q. Now with reference to the fact as to whether or not without regard to the level (whether on the lake level or above it,) but the surface of the ground itself—is it rolling or flat?

A. It is flat apparently, in its natural condition. It would seem like a dead level, with the few exceptions of these sand ridges.

Q. Have you any idea what distance above the level of 771 Lake Michigan the majority of the land on which Chicago stands would lie?

A. Yes sir.

Q. Please give me that.

A. The greater portion of it would be about 12 or 14 feet above the low water of the lake, what you call Chicago datum.

Q. About fourteen feet?

A. Yes sir.

Q. Now will you describe the Chicago River and its various branches with reference to the city and the sources originally of the rivers, the river or branches thereof; also the points into which the river emptied.

A. The Chicago River and in fact all of the rivers that empty into the lake along the southern and western portions of Lake Michigan, you may say, have been formed as the Lake Shore—as the water receded, and the lake shore was built up so that they have been formed, so that they run parallel with the lake. They have been shut out from the lake as the waters receded, by ridges of sand or drift, or something that has come in and left them running parallel with the lake. That is a peculiarity of that portion of Lake Michigan. There are no rivers
772 reaching back into the country and discharging directly
into the lake in the ordinary form of drainage, but the rivers are all parallel, with occasional points where they break through the obstruction into the lake, and hence they are rivers of minor importance, only covering a few square miles of drainage territory tributary to them. The Chicago River proper is short, originally not over a mile long from the lake back to the confluence of the two forks one leading from the south and one from the north; the southern fork called the south branch and the northern fork called the north branch. The northern branch really drains the most territory and from a district of higher elevation somewhat as its source, which is in the State of Wisconsin. The south branch at a distance of about five miles from the lake, as it originally existed, has two branches, one known as the west fork, and the other as the south fork. Those branches—the south fork draining a very limited territory, wasn't much, you could hardly call it a stream except in floods. The west fork only drained a small territory also, except as the flood waters of the Des Plaines River at a distance of about nine or

ten miles from the lake would break over and come down the west fork of the river; then that would become a large stream.

The Des Plaines River is another stream running parallel
773 with the lake, but it is more remote from the lake.

Q. Where was the exit of the Des Plaines River naturally?

A. The upper Des Plaines river heads in Wisconsin and flows southward until it comes to South Chicago, and about ten miles distant from the lake, when it turns southwest and joins the Kankakee, below Joliet, forming the Illinois River.

Q. Is there a watershed between the Des Plaines and the South Branch of the Chicago River?

A. Yes sir. That is, you mean—

Q. That divided the waters?

A. Yes sir, there is a divide. That is, the Des Plaines never flows into the Chicago River except at one point, at the point where it turns southwest to the Illinois River, it has always within recent geological times, at high stages flowed both ways. It would divide, one portion going to the southwest; the other portion going to the east and through the Chicago River to the lake.

Q. How close in the ordinary stage of the water is this point on the south branch of the Chicago River and the Des Plaines River, where at flood time of the Des Plaines there is an overflow both ways to the southwest and into the lake, from the Chicago River?

A. I don't catch you question.

774 Q. I want to get the distance between the Des Plaines
River and the Chicago River, at the point where you say the Des Plaines at flood tide sometimes empties itself into the Chicago River?

A. Well the distance to the extremity of the west fork of the Chicago River, of the south branch of the Chicago River was only a very few miles, and really, within thirty years you may say it has been practically connected with the Des Plaines River. They built out there, that is, they cut a ditch, the land owners did, and absolutely tapped the Des Plaines River and drew it to Chicago, even at low water, until the city went and built a dam and shut that off and restored the natural condition.

Q. Is that in the city limits of the City of Chicago?

A. No sir, that is outside of the city limits and the distance from the present city limits is about three miles and a half.

Q. Now as to the north branch of the Chicago river; where does it take its origin?

A. Well, I cannot answer that exactly now.

Q. Well, approximately, do you know?

A. It couldn't be over twenty or twenty-five miles.

775 Q. What is the natural volume of that stream of water, about what size river is it?

A. That depends on the conditions of the floods.

Q. I mean in the ordinary stage?

A. In the ordinary stage it is not large, and in extremely dry weather it disappears practically.

Q. That is the north branch?

A. Yes, practically so. In high floods it has been gauged. We have had floods there that discharged about 210 cubic feet a minute in the North branch.

Q. That is a pretty good sized volume of water?

A. Yes, it was quite a volume of water at that time.

Q. Could you give me an idea of about how wide the stream is at the city of Chicago?

A. Well that is a harbor now; it has been dredged and docked.

Q. Do you know what is was originally?

A. No, I couldn't say.

Q. You didn't see it originally?

A. I didn't see it originally.

Q. The stream has been widened now?

A. Yes sir, widened and deepened.

Q. Widened and deepened by dredging?

A. Yes sir.

776 Q. Now has it been dredged and docked any since you have been in Chicago to your knowledge?

A. Yes sir. As you go further up the stream you will find the stream where it is in its natural condition.

Q. Outside of the limits of the city of Chicago?

A. Even within the limits of the city of Chicago.

Q. Now at that point where it is in its natural condition have you any idea of the volume of water that flows in the ordinary water stage, and the speed of the current?

A. I just gave you that. At low water it is practically dried up.

Q. But in the ordinary stage of water?

A. I have no gaugings at ordinary stage, I could not say. I have an idea, it is very small at the ordinary stage.

Q. Have you any estimate of the amount of flow and the speed?

A. You are wishing to get at the speed of the flow, in the lower portion of the river proper?

Q. No sir, I am asking you up there now.

A. Up there (indicating on the map)?

Q. Yes.

A. No sir, I cannot give you that, I haven't got the data for that.

Q. Now have you any idea of the speed of the channel between where it has been dredged and docked in the central
777 portion of the city?

A. It varies from a rapid current in high stages to no perceptible current at all.

Q. In ordinary water stages?

A. In ordinary times. It is modified, however, by some artificial work that has been done by the city, pumping works connected with it.

Q. Where are the pumping works?

A. They are at Fullerton Avenue.

Q. Well, what is the character of these works, and what is the effect of it upon that north branch?

A. There is a conduit extending from the lake to the north branch on Fullerton Avenue, twelve feet in diameter, and a pumping works connected therewith.

Q. Are the pumping works at the lake?

A. It is at the river, but the conduit is below the lake, so that it acts the same as if it was at the lake. It don't matter what end the pumping works is at, it merely takes the water from the conduit and throws it into the river.

Q. Pumps it up into the river?

A. Yes sir.

Q. What is the volume of the water?

A. The capacity of those works, when running to the
778 usual working capacity, is 15,000 cubic feet a minute.

Q. Fifteen thousand cubic feet a minute?

A. Yes sir, for the pumps.

Q. When was that pumping station at Fullerton Avenue built?

A. That was done about 1879, that is, the pumps were put in. The conduit was built—it took several years to build it, previous to that.

Q. Where does that conduit strike the lake?

A. It strikes the lake on the shore through Lincoln Park; on the shore of Lincoln Park.

Q. Well, with reference to the northern and southern lake front of the city?

A. Well it strikes the north shore.

Q. The north shore?

A. Yes sir.

Q. Is it in or adjacent to a densely populated portion of the city?

A. Yes, quite densely populated.

Q. In which direction does that conduit extend?

A. It extends west from the lake to the river, directly west.

Q. How far is that distance, do you know?

A. Twelve thousand feet.

779 Q. Is that conduit in operation with the pumping works now?

A. Yes, at intervals, sometimes it isn't working.

Q. What was the effect of that upon the water in the north branch of the Chicago river?

A. The effect of it was to flush the river out to a greater or less extent, depending upon the amount of water put in.

Q. When flushed out where did it empty?

A. It emptied at the confluence of the south and west branch of the river.

Q. And from thence into Lake Michigan?

A. Into Lake Michigan, except as it went down the south branch due to a change of the regimen of the river.

Q. There was no change in the river until the opening of what is known as the Chicago Drainage Canal?

A. Yes sir.

Q. There was?

A. Yes sir, for thirty years.

ATTORNEY-GENERAL HAMLIN: For how many years?

A. For thirty years or thereabouts, there has been a flow through the south branch, southwest to the Illinois & Michigan Canal.

Q. To the Illinois & Michigan Canal?

A. Yes sir.

780 Q. Now which is the larger, the south branch or the north branch of the Chicago river?

A. The north branch carries the most water.

Q. In its natural state?

A. In its natural state, except as I say, in the Des Plaines river flood. As far as the size goes, in the rivers, as they stand today, perhaps there isn't much difference; they have been docked and dredged to the same depth and width.

Q. Now are you familiar with the amount of deepening that was done in the north branch of the Chicago river by dredging?

A. Only in a general way. I know that the government has dredged there, and the city and the dock owners. There has been a continuous process of docking it and bringing it to the usual depth there, extending upward all the time, as there has been a demand for property.

Q. How far is it from the confluence of the south branch and the north branch of the Chicago river to its exit into Lake Michigan?

A. I suppose before the canal was in operation, as it exists today, that is, with the piers that have been extended out into the lake, and caused a channel, it is about, I think, 7,400 feet. I have the exact distances here somewhere.

Q. Seventy-four hundred feet?

A. I will give it right. It is 7,113 feet.

781 Q. Now how far out into the lake, beyond the natural opening of the river, has the present opening been extended by artificial means, such as piers, etc?

A. I cannot answer it exactly.

ATTORNEY-GENERAL HAMLIN: Do you mean out into the lake?

Q. Yes, out into the lake.

A. Nearly half of that distance is an extension from the original. That is in the state of nature before they had any other.

Q. Now, has there been a filling in of the lake front at the mouth of the Chicago river with soil, debris, etc.?

A. Yes sir. I would explain that the mouth of the Chicago river was at one time, nearly half a mile south of where it is now. It turned south. It didn't change the river where it was naturally, you may say, from Rush Street to the confluence of the forks, and at that point it turned south and entered the lake nearly half a mile south of where it is now. There was a bar existing there at what is now the outlet. They cut through that and have filled that old channel of the river.

Q. South of the river?

A. South of the river, what was the old channel of the river, and they have been filling continuously more or less, and are today, out into the lake.

782 Q. Now how far up into the city of Chicago is the north branch dredged and docked?

A. I couldn't say positively, I think about four miles from the conjunction of the main river, but it is being dredged up as far as Lawrence Avenue.

Q. And how far would that be?

A. It would be about six miles above the river.

Q. Six miles from the confluence of the two branches of the Chicago river?

A. Yes sir.

Q. Now up as far as it is dredged and docked at the present time is it opened for shipping?

A. Yes sir.

Q. Is it used for shipping?

A. Yes sir.

Q. Have you any idea of the depth of the North branch of the Chicago river at that point?

A. It is very near fifteen feet.

Q. Fifteen feet?

A. Yes sir. Sixteen feet has been about the deepest they have dredged up to within a few years.

Q. Now you talked about the Lawrence Avenue conduit, what kind of a conduit is that?

A. I said Lawrence Avenue.

783 Q. Well, is there a conduit there?

A. Yes sir, there is a conduit at Lawrence Avenue partially—it is not done yet; it is being built.

Q. Being built now?

A. Yes sir. You may say it is in process of building. It was begun some years ago, and progressed to a certain point and then there was difficulty with the contractor, and at present it is tied up.

Q. Who has been building it?

A. There is no work being done on it. The city of Chicago is building it.

Q. The city of Chicago or the Sanitary District?

A. The city of Chicago.

Q. Do you know the size of that conduit?

A. Yes sir.

Q. What is it?

A. It is sixteen feet circular inside.

Q. Does it connect with the lake, or will it?

A. It will connect with the lake and extend across to the north branch of the river, similar to the manner of the Fullerton Avenue conduit.

Q. And it is in the northern portion of the city of Chicago?

A. Yes sir.

784 Q. What is the design of that conduit?

A. That conduit is to take away by means of a system of intercepting sewers the sewage that now discharges into the lake along the north shore over to the north branch of the Chicago river, and it is also to take the supply of water from the lake to the north branch.

Q. With the view of emptying that sewage into it?

A. By means of the pumping station.

Q. Into the North branch of the Chicago river?

A. Yes sir.

Q. Which now goes into Lake Michigan?

A. Yes sir.

Q. Now let us go down to the South branch of the Chicago river; where does the west fork of the South branch of the Chicago river have its origin with reference to the city of Chicago?

A. It has its origin, putting it by streets, very near to Ashland Avenue and Thirty-first Street.

Q. In the limits of the city of Chicago?

A. I want to correct that. I should say Ashland Avenue and 26th Street. Yes sir, in the limits of the city of Chicago.

Q. Now in what general direction does that West fork naturally flow?

A. Why it flows only one way; that flows to the east.

785 Q. To the east or northeast?

A. Well, slightly to the north.

Q. Well, does it flow in that direction now?

A. Yes sir.

Q. Now how does the volume of water in that compare with the volume of water in the North branch of the Chicago river?

A. It is less for ordinary times, but more at other times. That is, there have been, especially in the past, before there were any changes in the conditions of the river, flood waters of the Des Plaines which have overflowed into that river, and swelled that river to a greater volume than the North branch.

Q. Well, at what particular time does the West fork carry more water than the North fork, aside from any artificial interference that has been made with it?

A. At high floods of the Des Plaines.

Q. Where the Des Plaines overflows, breaks over and connects with it?

A. Yes sir.

Q. Does that happen now?

A. Yes, but to a somewhat reduced extent. A flood must now be higher than in the past, in order to furnish the supply to the North branch, but in very high floods it still furnishes a large amount of water there.

Q. Do you know anything about the speed of the current 786 naturally, in the West fork of the South fork of the Chicago river?

A. There is very little, almost no speed.

Q. An almost imperceptible flow?

A. Yes sir.

Q. Is the West fork of the South branch dredged and docked at all?

A. Yes, for a considerable distance.

Q. Above the confluence of the South branch of the West fork?

A. Yes sir.

Q. How far?

A. Well, I should say two miles more or less.

Q. Do you know anything about how far it is from the confluence of the South branch of the Chicago river and the West fork of the South branch, down to the exit of the river, or what was the exit of the Chicago river into Lake Michigan?

A. Repeat that question.

Q. Do you know what the distance is from the confluence of the two branches of the South fork of the Chicago river to what was formerly the mouth of the Chicago river at Lake Michigan?

A. Yes sir, it was about five miles.

Q. Now where is the origin of the south fork of the South 787 Branch of the Chicago River?

A. Its origin proper is three miles south of its confluence with the South Branch and it was, you might say, merely gullies leading into a larger channel, it ran out into the prairies. It was practically no river at all.

Q. Connected with what is known as the west fork?

A. Yes sir, that's right.

Q. The drainage area of it was originally open country was it, or prairie?

A. Yes sir.

Q. With a rolling or flat surface?

A. A flat surface.

Q. Now what was the volume of water in that in its ordinary stage compared with the volume of water in the west fork?

A. There was no water in the ordinary stage. It was only a storm water drain.

Q. That is, you mean by that, when there is a precipitation of rain on the drainage area, tributary to it, the water would run down?

A. That was the out-flow from storm water, and that ran off in a short time and disappeared.

788 Q. Now at this time is the south fork of the South Branch of the Chicago River dredged and docked any?

A. Yes, to the stock yards.

Q. Now how far is that from the point of confluence of the west and south forks of the South Branch of the Chicago River?

A. It is one and a half miles, but I think a little more than that.

Q. Is that open now up through to that point? Is it dredged and docked for shipping?

A. Yes sir.

Q. What is the volume of water in there; I mean the depth of it?

A. That isn't far from the usual depth of the river; I expect about fourteen feet. Lake vessels can pass in it there to the stock yards; that is, they did do it.

Q. Now you say the stock yards are located there; when you say that what do you mean? Do you mean to say the principal stock yards of the city of Chicago?

A. Yes sir the stock yards and the slaughter houses.

Q. Do you mean the packing plants?

A. The large packing houses are located there.

Q. Do you know the names of the packing plants?

789 A. All of the live stock that goes into the city of Chicago goes to those stock yards, except some that goes, perhaps to Hammond, Indiana. That goes through the City to Hammond, Indiana, near by. That is where the packing plants are located.

Q. Is there any connection at the present time between the south fork of the South Branch of the Chicago River and Lake Michigan, other than up through the South Branch of the River?

A. No sir.

Q. Has there a conduit been built down there at any place?

A. There is a conduit that has been built from what we call the east arm of the south fork; that arm is merely a slip dredged out for docks—or laid out for docks.

Q. A slip for ships?

A. Yes sir, and there is a conduit built from there to the lake twenty feet in diameter.

ATTORNEY-GENERAL HAMLIN: Did you locate that conduit?

A. No sir, I did not; I say I did not; not at this time; I figured on conduits there some years ago.

ATTORNEY GENERAL CROW: You know where that conduit is located?

A. Yes sir.

Q. Do you know for what purpose it is used?

A. It is not used at all; it is to be used to carry sewage
790 from the district, from Lake Michigan on the south shore, and south side, to the stock yards slip, and to take the sewage in from the lake to the stock yards.

Q. To the stock yards? For what purpose was it taken?

A. It is to be taken in for the purpose of supplying water to the river and flushing that south fork, that is, purifying it, putting in better and making it better, in a sanitary way, and of furnishing water to the Drainage Canal.

Q. Do you know the capacity of that conduit?

A. The pumps are being built there for a capacity of 120,000 cubic feet a minute.

Q. That is to be a large conduit there; larger than the Lawrence Avenue conduit, or the Fullerton Avenue conduit?

A. Yes, it is twenty feet in diameter.

Q. It isn't finished yet?

A. The main conduit is finished; they are cleaning it out now.

Q. Are the pumps at work?

A. No sir, the pumps have not been built yet.

Q. Do you know when it is proposed to open that?

A. No one knows exactly; you can only estimate it; probably in the course of a year.

Q. Do you know the length of that conduit down there?

791 A. That is close to 12,000 feet.

Q. Something over two miles?

A. Yes, something over two miles.

Q. Do you know whether the channel of the south fork of the south branch of the Chicago River has recently been deepened?

A. Yes, there has been dredging going on there. Dredging especially up to the mouth of this conduit, or the outlet of this conduit that is to be.

Q. Within what period of time?

A. Within the past year.

Q. Do you know the extent of the deepening of that channel?

A. No, not exactly.

Q. Approximately, do you?

A. Well, they are certainly deepening it. They must have deepened it in the neighborhood of twenty feet. They are deepening at least at the outlet of this conduit, to the bottom of the conduit, which would be over twenty feet.

Q. That is, it would make over twenty feet of water level in the south fork of the south branch of the Chicago River?

A. At that point at least, the outlets usually carry that depth of water.

Q. Do you know anything about the rate of flow in the south fork of the South Branch of the Chicago River at this time?

A. There is no flow in it except as comes from the sewage
792 discharged into it and from the various sewers that connect with it?

Q. What do you mean when you say there is no flow except what comes from the sewer that is discharged into it?

A. Well I mean this; you might say this is an arm of the river extending out, without any drainage area to it, except what comes from the sewers, and any sewage or stream sewage entering the south fork from those sewers, will finally pass into the Chicago River,—the south Branch of the Chicago River.

Q. Well, is that a perceptible flow in that South Branch?

A. Many times it wouldn't be perceptible at all, with variations of the wind or the lake or something of that kind. Which would make it flow up the other way sometimes. However, there is a working out of the contents of the south fork.

Q. Now do you know how much territory there is in the city limits of Chicago that is drained by sewers?

A. No, not in that form. Answering the question in that form I do not. I can give you how much territory there is in the City of Chicago, and how the sewerage goes. How the sewers are built; into what points they empty, and the population of the various sewer districts.

Q. What I was trying to get at was, what was the amount of surface within the territorial city limits of the City of Chicago?

A. That I cannot give you exactly. The area of the city 793 of Chicago is 190.6 square miles.

Q. Do you know the area of what is known as the Sanitary District of the city of Chicago?

A. Yes, it is 185 square miles.

Q. Were you ever connected with the Sanitary District of the City of Chicago?

A. Yes sir.

Q. At what time and in what capacity?

A. After the Sanitary District was formed, that is, after the legislation establishing the Sanitary District Board, I was chief engineer of the work from January, 1892, to some time in 1893, about a year and a half.

Q. You were the first civil engineer then?

A. No sir, I was not the first; there were several before.

Q. Well, in your capacity as engineer did you have charge of the work?

A. I did.

Q. Was there any superior officer in your department above you?

A. No sir, none but the Board. I reported directly to the Board.

Q. You became in that way, familiar with the territorial 794 limits of the City of Chicago?

A. Yes sir.

Q. Now has that area of territory been enlarged or diminished any since that time?

A. No sir, it remains just as it was established.

Q. The same now as then?

A. Yes sir.

Q. Now will you please tell me how the territorial area of the Sanitary District of Chicago lies with reference to the territorial limits of the City of Chicago?

A. The Sanitary District of Chicago is bounded on the north by Devon Street.

Q. In or outside of the city limits of Chicago?

A. Partly in and partly on the borders of the city limits.

Q. The northern limits?

A. Yes, the northern limits partly, and partly Devon Street. The North Sanitary District boundary line is south of a portion of the city of Chicago. The City of Chicago extends beyond the lines and it is bounded on the south by 87th Street.

Q. In or outside of the City limits?

A. In the City of Chicago for most of the way and following 87th Street outside of the city for a distance of three miles.

And it is bounded on the west in a general way by Harlem
795 Avenue. The Western boundary is somewhat irregular.

Q. Is that in or out of the city?

A. This is shown on this map that is before you, by a yellow shading—

Q. (Question repeated).

A. That is out of the city. That is, the western boundary is beyond the boundary of the city for a part of the way. It conforms to the boundary for about five miles.

Q. Now where is the eastern boundary?

A. It is Lake Michigan.

Q. That is concident with the boundaries of the city limits?

A. No sir.

Q. It is not?

A. No sir.

Q. What is the difference?

A. There is a part of the city that lies south of 87th Street.

A. Yes sir.

Q. Then it concides with the city limits from Devon Street on the North to 87th Street on the south?

A. Yes sir.

Q. Then the territory lying south of 87th Street and on
796 the lake front is not in the Sanitary District?

A. No sir, it is not in the Sanitary District.

Q. Now do you know how much area surface there is outside of the Sanitary District in the limits of the City of Chicago?

A. I said the area of the Sanitary District was 185 square miles. Of that area 141.8 square miles is within the city limits of the City of Chicago.

Q. At this time?

A. At this time. And 43.2 of it lies outside of the City limits.

Q. Now that portion outside of the city limits of the City of Chicago, where does it lie—in the state of Illinois?

A. Yes, it lies in the State of Illinois, and Cook County, just west of the City of Chicago.

Q. Now how far is it from the southern boundary of the Sanitary District of the City of Chicago, to the Indiana state line?

A. Well, the Indiana State line runs north and south at right angles to that southern boundary.

Q. At exact right angles?

A. At exact right angles, yes sir.

Q. I thought it ran in triangular shape?

A. No sir, it runs at exact right angles, or following the lake shore. There is the lake front between the two, a direct north and south line for two miles.

Q. That's what you make it?

797 A. Yes sir, following the lake shore it is a little more than that.

Q. Now do the city limits of the city of Chicago join the western boundary of the State of Indiana at its northern limit?

A. The eastern limit of the southern part of the City of Chicago joins the state of Indiana.

Q. The western and northern boundary line of the State of Indiana?

A. It joins the western boundary line of the State of Indiana.

Q. It is connected with the line that runs up to Lake Michigan?

A. Yes sir.

Q. And the city of Chicago is built on the Lake front, up to the point where the northern line of Indiana strikes Lake Michigan?

A. Yes sir, and south of that.

Q. Yes, but it is built up to that point north?

A. Yes sir.

Q. Now how far is that on the Indiana state line—how
798 far does the City of Chicago run?

A. From where the Indiana state line strikes Lake Michigan to the Southern boundary line of the City of Chicago is four and one-half miles.

Q. Four and one-half miles?

A. That is, the eastern boundary line of the city of Chicago conforms to the western boundary line of the state of Indiana for a distance of about four and one-half miles.

Q. Now going to the northern and western portion of the City of Chicago, how far is it from the city limits on the west of the City of Chicago to the Wisconsin State line?

A. That wouldn't reach Wisconsin.

Q. It wouldn't reach Wisconsin?

A. No sir, Wisconsin is north, immediately north, directly north, not immediately north.

Q. What is adjacent to Cook County on the west?

A. DuPage County; that is, for a part of the way. Cook County is a very long county, and Will county adjoins it.

Q. What lies immediately north of Cook County?

A. Lake County, Illinois.

Q. Does that touch Wisconsin?

A. That goes to the Wisconsin line.

Q. Well, the Des Plaines River in running northwest,
799 runs into Will County?

A. It passes through Will County, yes.

Q. And into Wisconsin?

A. Yes, but of course that is the reverse way from which the river runs. It heads in Wisconsin and runs south.

Q. Of course it comes south, but I am now ascending the river.

A. That's right, you pass Will County then into the territory of Wisconsin. No, I beg your pardon, change that. It is Lake County, not Will County. Wherever I said Will County I should have said Lake County.

Q. Now as engineer of the Sanitary District of Chicago did you become acquainted with the sewer system of the City of Chicago at that time?

A. Yes, but I became more acquainted with it when I was in charge of the sewers and when I was City Engineer of Chicago.

Q. When were you city engineer of Chicago?

A. I was City engineer of Chicago in 1878 or 1879, I have forgotten which, about that time.

Q. For two years?

A. Not two years. I was in charge of sewers for several years before that.

800 Q. So that you are familiar then with the sewer system of Chicago?

A. Yes sir.

Q. Now in your profession as civil engineer, it has been principally your business to study the building of sewers?

A. Yes sir.

Q. And the out-fall for sewers, and the manner in which they had to be constructed?

A. Yes sir, I have done a great deal of sewer work.

Q. Are you familiar with the sewer systems of different cities in this and other countries?

A. In a great many of them I am.

Q. Are you familiar with the city sewer systems in this country?

A. I laid out sewer systems, plants for the sewer systems in a great many cities in this country, and others, and I merely know their general manner of drainage, that's all.

Q. You have inspected some of them?

A. Yes sir, somewhat.

Q. Now are you familiar from a professional standpoint, with the adaptability of the sewage disposition of the sewage matter of the City of Chicago as compared with the relative sewage disposition of the same amount of sewage in other cities, as large or the same size in this and other countries?

A. Yes sir.

801 Q. Now what would you say as to whether or not the City of Chicago from its topographical and geographical location, is naturally adapted to the easy disposition of its sewage system as compared with that of other large cities or cities of the same size?

ATTORNEY GENERAL HAMLIN: I object to that question on the ground that it has no relation to the issues here made by the bill and answer.

THE COMMISSIONER: You can answer the question. The objection is passed on by the Court.

A. It depends on what you term the disposition, in that way. The sewers of the City of Chicago were originally built—it was very small. The territory was low-lying and the sewers used not extremely deep, and discharged into the river for the most part and part of them into the lake. It was not a complicated problem in its original inception except in the matter of grades to give to the sewers. That was a matter that had been considered and was considered a great deal by the engineer who inaugurated the system in Chicago. He went to Europe. As to whether in these long stretches of flat country he could build sewers and keep them under ground, and have the grades steep enough to carry the sewage away properly, and finally a system of grades was established and used. That was what might be called unprecedently low; that is, the inclination was very slight.

Q. Now that sewer system—

802 A. Now that wasn't a difficult thing, only it was somewhat of a doubtful thing, that's all.

Q. Now that was caused by the level surface of the ground on which Chicago was built?

A. Yes, and the long distances you had to traverse with the sewers.

Q. Now is there any great extent of natural drainage in the City of Chicago?

A. Well, you may say that of a territory when it has some slope to some point or other, but still in its natural condition water would flood it and in streams, and stay flooded a good while, but you could and did adapt or fix the sewers to a natural slope to a certain extent.

Q. What I am trying to get at is, whether the natural condition of the ground there—was there a good drainage surface on the surface of the ground?

A. Well the surface was practically prairie soil. No, there is not a good drainage, of course not for a long distance run. You had frequent connections with sewers, they could be made to take off the surface water promptly.

Q. In other words when this precipitation of rain or water on the natural surface of the ground would accumulate, it would not be drained by the natural conditions?

A. Not by the natural conditions rapidly, but slowly.

803 Q. And in consequence of that then, frequent connections had to be made with the sewer to take care of the rain precipitation?

A. Yes sir.

Q. Now is there any difference in a city with reference to the amount of sewage matter produced?

A. Yes sir.

Q. According to the population?

A. Yes sir, a good deal of difference.

Q. What causes that difference?

A. Generally depending upon the manufacturing conditions, as to the character of manufacturing that goes on, and sometimes, as to the general custom of connection of the sewers.

Q. Explain what you mean by that? Manufacturing produces more or less sewage. What do you mean with reference to the custom of connecting with the sewers?

A. Well, an iron foundry and a machine shop or a planing mill wouldn't greatly affect the system of sewage, of the quality of sewage, but slaughter houses and stock yards and cattle pens are very liable to affect it materially, and do.

Q. What lines of manufacture would affect it?

A. Well, particularly—that don't apply to Chicago—but in the east, various kinds of textile manufacture,—the dyes
804 and colorings, and the tanneries—Chicago has some tanneries—usually have a great many more than any other lines of manufacture. They generally affect the sewage. A distillery and to a certain extent breweries—various things of that kind affect it.

Q. That is, increase the amount of sewage?

A. Increase the amount of organic matter that goes into the sewage.

Q. Then the outflow of the sewage would be increased?

A. Yes sir.

Q. What did you mean by saying that the manner of connecting the sewers in the city would affect the out-flow of the sewage?

A. Well, in some city, if you notice, that has a system of sewers, the people will not all connect, unless they are forced to by some board of health or something of that kind. In the City of Chicago, I suppose, practically all connect with the sewer as soon as one is built in the street. It is not a good place for cess--pools.

Q. Why is that?

A. Because of the impervious clay.

Q. You mean by that, that percolations from the cess-pool would be great?

A. Would not be great.

Q. Would not be great?

805 A. No sir, it would accumulate there and overflow.

Q. And for that reason then the sewer connections in the City of Chicago is extremely large, is it?

A. It is very general indeed. You might say practically that the only population in the City of Chicago that has not sewage connections in their houses, are districts that have not got main sewers built.

Q. Where no connections can be made?

A. Yes where no connection can be made, and those are of minor importance.

Q. Do you know whether or not the city officials charged with the sewer connections and looking after those matters in the City of Chicago compel sewer connection wherever they can?

ATTORNEY GENERAL HAMLIN: That question is objected to.

A. My recollection is that they have health regulations. They used to when I was familiar with them, with reference to the connection and requiring them to abandon cess-pools, outhouses, in that connection.

Q. Well, as compared with your knowledge of the sewage out-flow of other large cities, what would you say with reference to the volume of sewage out-flow of the City of Chicago, as to whether it was greater or less in proportion to the population? 806

A. I think the proportion of organic matter flowing out through the sewer is greater in proportion to the population than is usual, and only very extraordinary cases would have a greater amount than Chicago.

Q. Do you know what proportion of the sewer system of the City of Chicago, or the territory of it, is lying below the level of Lake Michigan?

A. Not exactly, I never figured it out. All that is laid below the level of Lake Michigan is in the Southern districts, about 60th Street. South to 60th Street and east of State Street. Compared to the whole city, it is small, although it is large in itself. It would make quite a large city in itself.

Q. Is that a densely populated portion of the city?

A. Some portions of it quite densely and other portions even that are not sewered are densely populated.

Q. A good many thousand people in that area?

A. Oh yes; there are districts there where they haven't got any sewers at all, with 19,000 people in a district, in these flat, low districts.

Q. Now in the territory that is sewered, where the sewer is laid below the level of the lake, does that have to be pumped up to the water level to dispose of it?

A. Yes sir, that has to be pumped in that case.

807 Q. Now are you familiar with the location of the Illinois and Michigan Canal?

A. Yes sir.

Q. Now will you describe to me where that canal starts and how and where it touches Chicago if at all, and what connection, if any, there is between any stream from the City of Chicago and that canal?

A. Well, I suppose you mean in the city. In the upper portion of that canal—The canal starts up the Illinois River at La-Salle and continues along the river and then to the Des Plaines, and by the Des Plaines to the city of Joliet, and to Lockport.

At Lockport the level of the canal rises to what is known as Summit level. That level extends to the City of Chicago joining the south fork of the south branch of the Chicago River at Ashland Avenue south of 26th Street.

Q. Now do you know when that canal was built?

A. I think it was built in the '40s. In forty something, during that time.

Q. Where is the southwestern outlet of that canal?

A. As I explained, the outlet of the canal is at Lockport.

Q. The southwestern outlet?

A. That is the southwestern outlet. The beginning of the canal on the southwest is at LaSalle.

Q. It goes beyond that?

808 A. That follows up the river and raises with locks at various places.

Q. Now what is there at 26th Street there?

A. At the place where the canal joins the south fork there is a pumping works.

Q. That is at 26th Street?

A. Near 26th Street, south of 26th Street. Not at 26th Street. It is near to Ashland Avenue. Ashland Avenue passes at the side of the pumping works. The streets right in there run irregularly, but it is really about a quarter of a mile south of 26th Street.

Q. Now how far is it from the point where these pumping works are up to the confluence of the west fork and the south fork of the South Branch of the Chicago River?

A. About a quarter of a mile.

Q. Now what is the use to which these pumping works are put at this place, and who maintains them?

A. They were built by the city of Chicago for the purpose of creating a greater flow through the canal, for the sanitary benefit of the Chicago River, and were maintained by the city and operated by the city until 1900 I think, when they were turned over to this Sanitary District Board. The Sanitary District Board has since turned them over to the Illinois and Michigan Canal Commissioners. The State commission
809 that has charge of the Illinois & Michigan Canal.

Q. What did you say they had been used for?

A. For pumping water from the river into the upper level of the canal for the purposes of sanitation originally. They are now maintained for the purpose of keeping up the level in that canal for navigation purposes.

Q. Well, do you know whether or not the pumping there is constant, or whether there is a cessation in it?

A. For the most part it is constant, or used to be, but there have been times when there was a cessation.

Q. Do you know the object of the building of what is called the Chicago Drainage Canal?

A. I think so; I ought to.

Q. What was it?

ATTORNEY GENERAL HAMLIN: I object to that question on the ground that the Act creating the Sanitary District determines the object of the construction better than the recollection of the witness.

ATTORNEY GENERAL CROW: Go ahead.

A. It was done for the purpose of keeping the sewage in the City of Chicago out of the lake and polluting its water supply —and thereby polluting its water supply, and for the purpose of improving the condition of the river and branches.

810 Q. Now you are familiar of course with where the outflows of the sewers in the City of Chicago are, with reference to the canal?

A. Yes sir.

Q. Where were they?

A. They are scattered all along; I cannot begin to name them.

Q. Just generally with reference to the outflow of the sewage of the City of Chicago?

A. It is mostly in the Chicago River and branches, although a portion goes into Lake Michigan, and some into the Calumet River.

Q. Now where is the Calumet River?

A. The Calumet River is in the southern part of the city, entering the lake about 92nd Street, that is, the mouth of it.

Q. Now where does the Calumet River have its origin?

A. It has its origin in Indiana. There are two branches of the river and they both head in Indiana around the end of the lake.

Q. In what general direction do they flow?

A. They flow generally westward, turning for a time. One of the branches turning almost eastward, and a little south of eastward, and joining the other branch, and then flowing northward and slightly eastward.

811 Q. What is the size of that Calumet River after it strikes the City of Chicago?

A. That has been dredged and docked I think, to a width of 200 feet.

Q. How deep?

A. I think eighteen or twenty feet in depth. I don't mean all the way. I mean only its mouth. The other portions are probably—the river in its natural condition ends at the southern boundary line of the city. This is guesswork now somewhat. I have seen it a great many times, but it is probably 100 feet across,—may be 125, and in places 150 feet and more. It has a depth of ten or twelve feet.

Q. A pretty good sized stream?

A. A pretty good sized stream, yes sir.

Q. How far up it, has it been docked and dredged?

A. It has been dredged continously for three miles at least, and then it has been done in places, so that the river has been navigable for boats of lighter draft clear up to Hammond, Indiana, a distance of nearly 20 miles from its mouth, that is, following the windings.

Q. Now right in that connection could you give me an idea of the width of the South Branch of the Chicago River before it was dredged and docked?

A. Nothing authentic. This is, I have no records of that.
812 It was all dredged and docked before I ever saw it.

Q. Now do you know something about the width of the South Branch of the Chicago River now?

A. Yes sir.

Q. What is it now?

A. It is very variable. I know more about it as to its hydraulic proportions than I do as to its exact dimensions, but it ranges from 150 to 200 feet. At the bridges, there is less than 100 feet.

Q. That is, up to the point of confluence of the west fork and the south fork?

A. Yes sir.

Q. Now has the dredging and docking of it increased the flow of current?

A. You mean from what it was in the state of nature?

Q. Yes.

A. No, I don't know whether it has or not.

Q. Well, has the dredging and docking in recent years increased the speed of the flow?

A. The Sanitary District of Chicago has been dredging and docking it; that is I mean they had been dredging, and are preparing to widen and dock so as to increase the flow, and in places they have made it possible to increase the flow, but it
813 don't necessarily mean that the flow has been increased, though.

Q. Is it being widened all along?

A. Not every place, but they are working to get a standard width or a minimum width of 200 feet, and a depth of 26 feet to the central portion of the stream and 16 feet at the docks.

Q. The river banks have not been walled, have they?

A. They are docked with timber piles.

Q. No stone?

A. No masonry walls except at the bridge abutments.

Q. Now there are bridges over the river at all streets?

A. A great many of them; not all of them.

Q. Now what proportion of the sewage system, or population, either way you want to put it, of the city of Chicago has its sewage out-flow into the Calumet River?

A. Based on the census made by the Board of Education of the City of Chicago in 1900—

Q. The population census?

A. The population census made by the Board of Education of the City of Chicago in 1900, there is a population of 70,636 that drains into or is tributary to the Calumet River. It don't mean by that that all those people have sewer connection. A far greater part have, however.

Q. Now what was the amount of that population tribu-
814 tary to the Calumet River, say the first of January, 1900?

A. It was substantially that. This is estimated in the early part of January. It was made in May or June, somewhere along there.

Q. Substantially the same number?

A. Yes sir.

Q. Now do you know anything about the amount of the population in Chicago where the sewage out-flow is into the south fork of the south branch of the Chicago River?

A. Yes sir.

Q. Have you made any estimation on that?

A. I have represented all these things on the maps. I don't know whether reference is made to the map or not.

Q. I want to get it in the record so as to read it in the first place. You talk of a thing being represented on the map, and talk into the record, and when a man reads it, it is pretty hard to get at.

A. I could probably shorten that thing if you will allow me to go through and describe what I have.

Q. For those drainage areas and the population?

A. Yes sir.

Q. You can do that if you want to.

A. Without putting this in the record?

Q. I want to put it in the record?

815 A. Wait until I am through stating what I am saying now.

ATTORNEY GENERAL CROW: Repeat that question of mine.

(Question repeated).

A. I have made a distribution of the population of the City of Chicago according to the points of watercourse to which it is tributary for the whole city, and I have represented that distribution and division of the city into districts on the accompanying map. The boundary of the city, except the lake shore, is shown in blue. The dividing lines of the several districts, of the several sewer districts are also shown in blue, and I have numbered those sewer districts from 1 to 12, inclusive. I have determined the population for each of the several districts by means—Strike that out. I want to say something else first—I established those dividing lines between the several districts by means of a sewer map obtained from the Sewer Department of the City of Chicago that showed the main sewers. I then distributed the population to those districts by means of the detailed census of the Board of Education, and the wards and election precincts which I obtained from the Board of Election Commissioners.

Q. Now before we go any further, let me ask you. You made this map?

A. Yes sir.

Q. That is so far as the sewer districts are concerned?

816 A. So far as what appears on there in that way, is concerned.

Q. Made from official data you gathered yourself as engineer?

A. As I just described it, yes sir.

Q. What is the map, aside from the sewer districts you have laid off on it, what does it purport to be?

A. It purports to be a map made by Rand & McNally,—a standard map of the City of Chicago, dated 1902, scale two and one-half inches to the mile.

Q. Do you know from your personal knowledge of the city of Chicago and your knowledge of the map, as to whether or not it is a correct representation of the location of the City of Chicago with the streets and alleys, and the water-ways, and the lake front thereon?

A. Yes sir, it is a very good map so far as I can discover.

ATTORNEY GENERAL CROW: Now I want to offer the map in evidence as an exhibit.

ATTORNEY GENERAL HAMLIN: I don't think I understand some portions of it, and before it goes in, I would rather cross-examine him on it; but suppose you go ahead with the other matters.

ATTORNEY GENERAL CROW: I will withdraw the offer.

817 ATTORNEY-GENERAL HAMLIN: The only objection I have to it is that I don't think it is very accurate if it is based upon the census taken by the Board of Education.

ATTORNEY-GENERAL CROW: I can remove that objection by having him reduce it to the proportion of the Federal census.

Q. You have made that reduction, have you, Mr. Williams?

A. Yes, as a whole I have, but not individually.

ATTORNEY-GENERAL HAMLIN: Not as to districts?

A. No sir, but if I go through it and testify as to that I think I can explain all those matters, so that anyone could understand it.

Q. Is there much variation between the two?

A. Yes, very material, over three hundred thousand.

ATTORNEY-GENERAL CROW: Increase or decrease?

A. The Board of Education was over 300,000 greater than the Federal census.

JUDGE SPRINGER: That is for the whole city?

A. Yes sir, for the whole city as it stands today and as it stood then. I mean the boundaries being just the same then as they are today, and they were. There has been no change in the boundary of the city since 1899, before these two censuses were taken.

ATTORNEY-GENERAL CROW: Before I offer it, I will ask you to explain just the method by which you obtained 818 the population of these sewer districts, and then explain the relation between the population of the sewer districts as ascertained by the manner in which you ascertained the same, and the population of the same area or territory, as shown by the Federal census?

A. I first obtained the sewer districts by getting the map of the main sewers of the city of Chicago, showing which way they emptied and where they emptied and laying out their boundaries between the several districts, as shown on the map in blue lines, heavy blue lines, and these districts are numbered from one to twelve, being twelve in all. After those sewer district lines were established, I then took the ward maps, upon which the election commissioners' precincts were shown and the census of the Board of Education which gave the population of each individual precinct, and by means of comparing those maps with the boundaries of those sewer districts which I have put upon the map before you, why I was enabled to distribute the population very closely; in some cases absolutely. Where the dividing line fell on the precinct line, why there was no question about the distribution. Sometimes the dividing line between the

drainage districts would cut across a precinct, and then there would be a liability of a little variation as to what proportion of the population to put in one district, and what in an-
819 other, but it did not affect the results in any material way, not nearly as much as the errors in the census itself.

Q. Well, in what way did you reduce those same sewer district areas to the population as shown by the Federal census in 1900?

A. Merely by percentages.

Q. By percentages?

A. Yes, that is, the difference. For instance, I have not in comparing the wards, the then wards, 31, 33 and 34, are extended down into what you call the Calumet District of the city, south of 87th Street. As to those, the Federal census and the Board of Education census substantially agree. There was very little difference in those three wards. So for the district shown as No. 4, which is the Calumet district of the city of Chicago, I have assumed that the population, or rather have taken that population as the true population. Now taking that off of the remaining proportion of the city and comparing it with the Federal census, I find that there is a difference of sixteen per cent. That is, that the Board of Education census would have to be reduced sixteen per cent to correspond with the Federal census. Now that is the standard of reduction which I have used, and I determined the population of the Sanitary district by that method, which is shown by the yellow lines and figures on this map. That population of the
820 sanitary district is made up in this wise—

Q. Let me ask you a question. Does the total area of your sewer districts as you have divided them correspond with the sanitary lines, the lines of the sanitary district of the city of Chicago? That is to say, have you confined your sewer districts within the limits of the city of Chicago?

A. I have confined it within the limits of the boundaries of the city of Chicago. These sewer districts are all within the city of Chicago. They do not go outside.

Q. Well, are they all within the limits of the Sanitary district of Chicago?

A. No sir, as I was just saying, District No. 4 is all outside of the Sanitary district and there is a small part of districts Nos. 11 and 10 that is outside of the Sanitary district, but the population of the Sanitary district of Chicago consists by taking the school census inside of the city, and reducing it sixteen per cent, which gives 1,621,311. That is the population of the Sanitary district of Chicago within the limits of the city of Chicago for the Federal census basis.

Q. When you say for the Federal census basis, you mean that is the Federal census of that area of territory within the Sanitary district?

A. No sir, I do not. I mean that it is—yes, it alludes to 821 that, although I have based it on that school census, reducing it sixteen per cent, which can be applied to all of these districts.

Q. I understand what you mean, but I want the record to show this point. At first there is no Federal census separate, of the Sanitary district of the city of Chicago?

A. No sir, nor of the several parts of the Sanitary district.

Q. But not as an individual item?

A. No sir.

Q. But there is a Federal census of the city of Chicago?

A. Yes sir.

Q. And the reduction you made in the Sanitary district is on the basis of the number of people as disclosed by the Federal census in that sanitary area, or territory of the Sanitary district?

A. That's right, yes sir. Now, outside of the city of Chicago, within the Sanitary district is the town of Cicero, lying west, and having a population by the Federal census, of 16,310. There is also within the Sanitary district outside of the city of Chicago, the villages of Lyons, Summit, part of Riverside, a small part of Riverside, and a certain rural territory, which is estimated, making in all, including Cicero, 18,145 in population, in the Sanitary district of Chicago, outside of the 822 city limits of Chicago.

ATTORNEY-GENERAL HAMLIN: Based on what?

A. Based on the Federal census. That makes the total population of the Sanitary district based on the Federal census, 1,639,456.

ATTORNEY-GENERAL CROW: How does that correspond with the Federal census of the city of Chicago?

A. The Federal census of the city of Chicago is 1,698,575.

Q. Well, is it greater or less than that of the Sanitary district?

A. It is greater than that of the Sanitary district, the population of the city of Chicago is greater than the population of the Sanitary district. That is, I mean that the total population of the city of Chicago is greater than the total population of the Sanitary district.

Q. There is a portion of the city of Chicago that is not in the Sanitary district?

A. Yes sir, some small districts on the north.

Q. Now you are familiar with the population of the city of Chicago itself, are you, in a general way?

A. I am only familiar with it, as I get it from the census reports and seeing the people on the streets.

Q. You have lived there for thirty years?

A. Yes sir.

823 Q. What is your judgment as to whether or not that population is correct?

A. Well I have studied the question of the growth of the population of the city of Chicago, that is, the rates of growth. We did that before the Sanitary district was organized, and made diagrams showing what would be the probable population of the city of Chicago at times in the future, so that in that way I have familiarized myself with the rates of growth.

Q. Well, what do you say as to this increase that is shown by the school census, is it greater or less than you think it ought to be?

A. Well, the increase of the school census—the difference between the school census and the Federal census were irreconciliable, on the theory that each is accurate. One or the other or both are wrong, because they are made the same year and substantially at the same time.

Q. Do you know how the school people made their census?

A. They are supposed to make it by employing men and sending them out to take the census.

Q. They do it through enumerators?

A. They have individual enumerators, yes.

Q. Not on any basis of enumeration?

A. No sir, it is an actual enumeration.

Q. When was the census made?

824 A. Made in 1900.

Q. At the same time?

A. About the same time, I don't know whether it was the same month or not.

Q. Made under an ordinance of the city of Chicago?

A. Under a State law. The State law requires a census of the school children every year or two years, and also I think, gives the Board the right to make a complete census if they so elect, and they have for a number of years past, elected to make the school census complete, that is, of all the population. Those of school age and those not of school age.

Q. Now give me the population there according to the school census, then according to your reduction, corresponding with the same area as the Federal census, in the sewer districts as you have divided them.

ATTORNEY-GENERAL HAMLIN: Now at this point, as you are proceeding along another branch, I move to exclude from the consideration of the Court, all the testimony introduced with relation to the Calumet district or district No. 4 as marked on this map, as that territory is not involved in this suit; this being an action against the Sanitary district and that territory lies outside of the district.

ATTORNEY-GENERAL CROW: It is in the State of Illinois, isn't it, General?

825 ATTORNEY-GENERAL HAMLIN: Yes. I make that objection in behalf of the State of Illinois. Judge Springer, you can make it for the District.

JUDGE SPRINGER: Let the record show that I make that objection in behalf of the Sanitary district.

ATTORNEY-GENERAL CROW: I wiil offer this map in evidence.

ATTORNEY-GENERAL HAMLIN: I object to it on the ground that it is not based, as far as the population is concerned, upon a proper basis; that it is based upon the school census and not on the Federal census. These objections and motions are made on behalf of both defendants.

Map above offered in evidence marked by the Commissioner "Complainant's Exhibit No. 14, Frank S. Bright, Commissioner."

(This exhibit is not printed.)

ADJOURNED until 2:00 p. m., same day, February 26th, 1903, at Southern Hotel, St. Louis, Mo.

826 Southern Hotel, St. Louis, Missouri, 2:00 p. m., Thursday, February 26, 1903. Continuation after recess.

Present, the Commissioner and same counsel representing the respective parties.

BENEZETTE WILLIAMS,

Resumed the stand for further direct examination by Attorney-General Crow, and testified as follows:

Q. Now Mr. Williams, will you just go ahead with your explanation of that map and the sewer districts, giving the area and the population, etc.?

A. I forget just where I left off.

Q. Just give him a start will you Mr. Reporter?

THE REPORTER: The last question was: Now give me the population there, according to the school census, then according to your reduction to that corresponding with the same area as the Federal census in the sewer districts as you have divided them.

A. There was no answer to that?

ATTORNEY-GENERAL CROW: No answer.

A. The population of the city of Chicago by the school census of 1900 was 2,007,695. That has been distributed through
the several sewer districts which I have mentioned be-
827 fore numbers 1 to 11 inclusive, and the population marked
on the map, and they are as follows: Consolidating certain districts in accordance with the source of water, or rather the point to which they drain, I find the population tributary to the main river and the south branch which is carried directly into the Drainage Canal by the flow from the Lake, and is included in Districts 1, 8 and 12, about 791,677. The population

tributary to the Lake on the south shore, and which will ultimately be discharged into the South Park through the 31st Street conduit in District 2, 175,182.

The population that is tributary to the south fork in District No. 5 is 282,655.

The tributary to the west fork within the city limits, in District 7, is 74,899. In addition to that I would add that a considerable portion of the town of Cicero has been sewered which lies within the Sanitary district and that also drains into the west fork. The population tributary to the North branch of the Chicago river and that is included in Districts 9 and 10, is 555,789.

The population that is tributary to the Lake on the north shore, District No. 11, is 28,878.

Now aside from those districts as described there is a dis-
trict shown on the map there as No. 3 in the south part
828 of the Sanitary district with a population of 18,827; that
has not yet a system of sewers otherwise, and while there
is considerable population there, they have no sewage outlet.

There is also District 6, with a population of 9,152, which has no considerable amount of sewers, practically no drain at all.

District 4, which is the Calumet district lying in the city of Chicago south of the Sanitary district, has a population of 70,636.

ATTORNEY GENERAL HAMLIN: That is objected to and I move to exclude it on the ground that it is not in the Sanitary district, and not relative to the issues in this case.

ATTORNEY-GENERAL CROW: The latter part of the answer as applied to District No. 4.

THE WITNESS: I have to do something with the population of the city, you know, and tell what it is.

ATTORNEY-GENERAL HAMLIN: That is all right; we just object to it.

ATTORNEY-GENERAL CROW: That is for the Court at Washington.

THE WITNESS: Summarizing a little further, I would say
that there drains into the main river the south branch and the
various forks which are tributary to those rivers, a total
829 of 1,705,020 by the school census, and that there drains

into the lake on the north shore and the south shore that are ultimately to go to the Lawrence Avenue conduit, and the 39th Street conduit now in the course of construction, 204,060. After those conduits are put into operation, and the sewage intercepted and turned into the river that would have been distributed on the face of this population directly into the main river, the south branch and the Drainage Canal, 800,829.

Into the south fork, 476,664;
Into the west fork, 74,899;
Into the north branch, 584,664,

And the same quantity into the Calumet river before mentioned, making up the total population of the city in its manner of drainage.

Now to reduce them to the United States census, of those districts—all those districts except District No. 4, I would apply sixteen per cent reduction. District 4 comprises wards or parts of wards that were found not to differ materially from the United States census.

Q. Now do you know approximately the amount of population of the Sanitary district that drains into the North branch of the Chicago river in say about up to the first of January, 1900?

830 A. I have just given it.

Q. You gave it from the census of 1900, which was based on June, 1900.

A. Oh no, I couldn't tell you hardly how to get at that, but I suppose a little reduction would need to be made, but I couldn't tell you what, now.

Q. Well, five per cent reduction would cover it, wouldn't it?

A. Yes, more than cover it.

Q. Sir?

A. More than cover it.

Q. Then would you be willing to testify that five per cent less than the figures you have given were draining into the north branch of the Chicago river at that time, the first of January, 1900?

A. I would testify that five per cent reduction on what I count the basis of the United States census would probably give too small a result.

Q. Well that many anyhow, at least were draining into that north branch of the Chicago river on the first of January, 1900?

A. Yes sir, I should say so.

Q. Well now, how about the south branch of the Chicago River?

831 A. The same thing would apply.

Q. And the south fork of the south branch?

A. The same would apply.

Q. And the west fork of the South branch?

A. I would apply the same. Of course, now, you understand it is impossible to tell you how rapidly one part of the city grows in comparison to another part, save as you get the census returns.

Q. Yes. Now how much in January, 1900, what proportion of the sewage of the city of Chicago and the Sanitary district went into Lake Michigan, other than that which went through the Chicago river?

A. About 200,000.

Q. About 200,000 people?

A. Yes sir.

Q. Do you know at this time?

A. That is by the school census.

Q. Well, by the Federal census?

A. By the Federal census it would reduce it 32,000—well, say 30,000; that would make it 170,000.

Q. Now how much of the population of Chicago drains into Lake Michigan at this time, of the sewers?

A. I gave that a while ago exactly.

Q. Did you, that alone?

A. Yes, when I previously went over it.

832 Q. Well, you need not answer that then. I had forgotten; that is in there is it?

A. Yes, that is in there, relative to that population is all in there.

Q. Did you state this morning, or did you not, the object of starting a pumping works at 26th Street, at the head of the Illinois and Michigan Canal?

A. I think I stated it, but it was for the purpose of improving the sanitary condition of the city, and the water supply.

Q. In what way?

A. Improving the condition of the river by having lake water pumped into it—putting lake water into it, and keeping the sewage out of the lake.

Q. Well, how would the pumping at 26th Street, five miles from the Lake, take lake water into the Chicago river?

A. It set the current the other way.

Q. In what way?

A. From the lake.

Q. From the lake?

A. Yes sir.

Q. Then it reversed the flow of the Chicago river?

A. Yes sir.

833 Q. That was the intention of it, and did it do that?

A. It did do that and at certain stages of the storm water flows, which you may say was the most of the time—

Q. Now are you familiar with the condition of the different branches of the Chicago river in the Sanitary district of Chicago and the city of Chicago prior to January, 1900?

A. Yes sir.

Q. Well, what was the condition of those waters with reference to whether or not they were polluted?

A. They were very badly polluted.

Q. What with?

A. Sewage and drainage from manufacturing establishments.

Q. Do you know whether or not the pumps at 26th Street at the head of the Illinois and Michigan Canal were sufficient to meet the purpose for which you say they were erected, and used at that time, turning the Chicago river backwards and pumping the sewage out of the Chicago river and protecting the water supply of the city of Chicago?

A. They were entirely inadequate.

Q. How do you know that fact?

A. By survey and an examination of the whole question.

Q. You did examine it, did you?

A. Oh yes.

Q. As a civil engineer?

834 A. Yes sir.

Q. Officially?

A. Officially, yes sir.

Q. When did you make that examination?

A. In 1886 and 1887.

Q. Well then the result was—

A. And prior to that for that matter, but this was special then; that was specific.

Q. Then I will get you to state if you know whether or not the water supply at that time was polluted by this sewage?

A. It was.

Q. Now do you know where the city of Chicago from 1886 on up to January, 1900, was taking their water from?

A. Taking it from the lake at various points of intake, according to the dates and times.

Q. Well what portion of the lake, in front of the city of Chicago?

A. In front of the city of Chicago, yes sir.

Q. How far out into the lake?

A. From two to four miles.

Q. From two to four miles?

A. Yes sir.

Q. None less than two miles from the intake?

A. I think none less than two miles.

835 Q. How far out was the nearest one?

A. They may have been taking a short time from an intake less than two miles; it didn't exist long; it was extended.

Q. Do you know how many intakes there were?

A. Well, there are now five intakes, I believe is the correct number.

Q. Five intakes?

A. Five intakes.

Q. Do you know what there was in January, 1900?

A. The same.

Q. Do you know how far out in the lake the most remote one of them is?

A. Four miles.

Q. Four miles?

A. Yes sir.

Q. Do you know the distance between those intakes, up and down the lake front, north and south?

A. Well I could tell you where they are and then I could tell you the distances then.

Q. Well just locate them then.

A. There is one opposite 67th Street or 68th Street; there is another one opposite 14th Street, about this point. It is opposite 14th Street, that is where the Four Mile crib is. There is another one opposite Chicago Avenue, north of the
836 river; that is two miles to the crib.

Now there is another one further north; I can't tell exactly what street it is opposite if projected, but it starts out from the park on the north shore; it is called the Carter Harrison crib. Then there is one—nothing on here (indicating map) seems to indicate the exact location of it, but it is north of Fullerton Avenue some distance, perhaps a couple of miles—what was originally the Lake View intake.

Q. Now those intakes supply respectively different portions of the city I suppose?

A. They are all connected.

Q. They are all connected?

A. They are all connected, yes sir. Of course the supply depends on the pumping works. Now that varies. There is a great number of pumping works in the city and of course from every pumping works there is a certain district that the supply from those predominates.

Q. Where are these pumping works located, at the Lake Front?

A. Some of them, and some of them on the interior, a great many miles on the interior.

Q. Are there settling basins with these pumping stations?

A. No sir, no settling basins.

837 Q. No settling basin used in the Chicago water supply?

A. No sir, take it right from the lake.

Q. Take it from the lake?

A. Yes sir, there are tunnels leading inland to the various pumping stations from these sources of intake.

Q. And that water, is it taken from the level or from the bottom of the lake?

A. No sir, it is taken at an intermediate point.

Q. Between the surface and the lower level of the lake?

A. Between the surface and the bottom of the lake.

Q. Do you know how deep?

A. Well, I couldn't tell you; in the most of those intakes they have, they have different inlets where they can take it from the upper surface, or further down, at their option. Now just how they operate them I couldn't answer that.

Q. Then after the water runs through these conduits as you might call them, from the intake towers in the lake to the pumping station, it is forced by the pumps through the mains to the consumer?

A. Yes sir.

Q. That is the mode of supply?

A. Yes sir. But that network of pipes is all connected up without regard to the special pumping works.

Q. So that the force and power of each pump operates throughout the entire city?

A. So far as it reaches, yes. If one of the works was 838 shut down the people within that district would still continue to get water from the other works, with perhaps a reduced head.

Q. Then the force that they have in the water works system there is entirely supplied by pumps?

A. Yes sir.

Q. And there is no natural pressure?

A. No sir.

Q. Or water tower?

A. No sir.

Q. Now is there any system of filteration?

A. No sir.

Q. None whatever?

A. No.

Q. Can you describe to me what is called the drainage canal on that map, where it begins and where it ends and the size of it?

A. Beginning in the city at Robey Street about a quarter of a mile north of 31st Street, and follows parallel with the old Illinois and Michigan Canal to Lamont, that is to range line, just east of Summit. That is the point where the Des Plaines river turns to the Southwest. That stretch of the canal is 41,100 feet in length.

JUDGE SPRINGER: Is it 28.5 miles?

839 A. That is the total length.

JUDGE SPRINGER: That is from Robey Street to the controlling works?

A. Yes sir, I think that is right—not five-tenths, but five hundredths.

JUDGE SPRINGER: Yes, five-hundredths; that is correct, from Robey Street to the controlling works?

A. Yes sir. The grade, the bottom of the channel at Robey Street is minus 24.45 feet.

ATTORNEY GENERAL CROW: Explain what you mean by that?

A. I mean that it is below the datum to which all the levels are referred.

Q. In the City of Chicago?

A. Yes sir, which was low water mark of 1847.

Q. Low water mark of what?

A. Of the lake.

Q. In 1847?

A. In 1847.

Q. And how much is that low water mark for 1847 below the usual level of the lake now?

A. Taking a series of years, the lake fluctuates over a range of four or five feet, and over a range of several years
taking the series of years up to a few years ago I found
840 that the datum was 1.9 feet lower than the mean level of
the lake.

Q. You mean the low water mark of 1847?

A. Yes sir, the low water mark of 1847 datum.

Q. How long a series of years did you cover for that experiment?

A. Well it was all the records we had up to that time, I have forgotten how many years it covered; it was a good many years though, twenty-five to thirty years probably.

Q. How much did you say?

A. One foot and nine-tenths below the mean level of the lake.

Q. The ordinary level?

A. Now there comes the maximum rise of the lake, which would go three or four feet above datum; and then there come times when it is a foot below datum.

Q. Now are those maximum and minimum waters in the lake affected by the seasons?

A. Yes sir. In every year there is a period of minimum level and a period of maximum level, the minimum level coming almost invariably about January. The maximum level sometime in the summer, I have forgotten the exact month, probably August; then there are daily fluctuations, and hourly fluctuations due to the variations of the wind. If the wind changes suddenly from one direction to the other, there will be a change
841 in the level of the lake. Then there are seasonal fluctuations; there are a term of years, often over ten years at a time that the lake will be continuously rising, these seasonal fluctuations, that is from August to January still going on just the same, but the general trend is a rise—

Q. An upward trend?

A. Yes; then there is the reverse—those are due doubtless, or probably ascribed to the rainfall—

Q. Precipitation of the drainage area?

A. And the drainage area of the lake.

Q. Now with that as an initial point, describe that canal from a hydraulic and from a shipping standpoint, its capacity and size.

A. Starting at Robey Street the grade of the bottom is 24.45 feet below datum. The inclination as we term it, of the canal in glacial drift—I would say there are two sections of the canal, I mean two sections as far as the manner of treatment.

The canal from Robey Street to Willow Springs which is a distance of 13.2 miles has an inclination of one in 40,000—

Q. Now explain what you mean by that, so we can get it in the record.

A. I mean that in 40,000 feet the bottom of the canal falls one foot.

Q. One foot of fall to forty thousand feet of canal?

842 A. Yes sir. So that at Willow Springs the grade of the canal is minus 26.2 feet below datum. The first part of this section—while this is dug in glacial drift,—that is, the first part from Robey Street to the range line at Summit is dug in glacial drift and is 110 feet wide on the bottom and slopes two for one,—that is two horizontally to one vertically.

Q. Making the width 160 or 165 feet?

A. Making the width about 200 feet.

Q. Two hundred feet?

A. Yes, at the water line. From the range line at Summit, to Willow Springs it is in glacial drift, all except for a short distance where it strikes some rock, but it is built in the same manner, 210 feet wide on the bottom and with slopes two to one.

Q. Through the rock?

A. Whatever rock they encountered; they only encountered a little rock in the bottom, but through the rock; it is a glacial drift section,—so considered.

Q. Now when you use the term "Summit" there at this point in the canal, what summit do you refer to,—the watershed between Chicago and the Des Plaines River?

A. I refer to the village of Summit, and that takes its 843 name from the fact that it was the point and is the point where the Des Plaines river at flood, discharges both ways. That is it is the summit of the valley between the Lakes and the Mississippi.

Q. At that point?

A. Yes sir.

Q. Well now, go ahead.

A. From Willow Springs to the controlling works, or rather to within four thousand feet of the controlling works, the channel is 160 feet on the bottom with vertical sides, taken out by excavating the rock vertically by means of tunneling where rock existed, which was the most of the way, and in filling up the gaps with the masonry wall, so that it is a uniform channel 160 feet wide on the bottom and about, I suppose at the flow line, owing to the offsets in the tunneling, operation, it was about 162 feet.

Q. At the top?

A. At the top. Now that section of the canal has an inclination of one in twenty thousand; it doubles the inclination at the glacial drift section.

Q. And there is a fall of one foot for every twenty thousand feet—lineal feet of canal?

A. A fall of one foot for every twenty thousand lineal feet of canal. When the canal reaches within four thousand feet of the controlling works, it widens out fan shaped, or gradually into a basin, that at the controlling works, or just 844 above the controlling works, is several hundred feet wide. I don't remember the exact width of that; it is not very material; it is meant for a turning basin where vessels could turn or manouver, and the same grade is continued to the controlling works, the portion of the canal at the controlling works being minus 30.1 feet; that gives a total fall in the bottom of the canal between Robey Street and the controlling works of 5.55 feet.

Q. 5.55?

A. Yes sir.

ATTORNEY GENERAL HAMLIN: Hadn't you better locate the controlling works?

ATTORNEY GENERAL CROW: I will do that.

THE WITNESS: As to the capacity of this canal—

Q. Well, in the first place, before you do that—are the sides of this fan shaped extension or basin at the controlling works walled?

A. They are walled so far as they are not in rock; they are solid, vertical face, by reason of the walls built above the natural rocks.

Q. Now where are the controlling works; where are they located?

A. The distance of the controlling works, from Robey 845 street is 28.01 miles.

Q. At what point?

A. The controlling works is near to Lockport, somewhat above Lockport.

Q. Well then it is a small town?

A. A small town on the Illinois and Michigan canal, at the point which was the end of the Summit level of the Illinois and Michigan Canal.

Q. Now as to the volume of water that that canal carries?

A. The original design,—that is I mean as prescribed by the law is intended to be 600,000 cubic feet a minute, the water in the Lake being datum.

Q. That is to say at the low level of 1847?

A. Except that the first section from Robey Street to the range line at Summit was made smaller with a view to being widened in the future as the demand of the city should arise. The law called upon the Sanitary District in all the rock sections, to build to the full capacity of 600,000 cubic feet a minute, and the other portion could be built smaller and enlarged as needed. When that is enlarged to the standard size adopted for the glacial drift section, that is 210 feet on the bottom with slopes of two to one, then it will be of uniform dimensions all the way through the glacial drift section.

Q. What you call the glacial section is the earth section? 846

A. The earth section.

Q. What is the character of that soil?

A. Well it is clay soil, embodying boulders, in some places, a great many boulders in some places; in some places they made up pretty nearly half of the amount of the material; in other places there was not but a small amount of them.

Q. Do you know when that canal was first begun?

A. This drainage canal?

Q. Yes?

A. The first excavation was made in—it was either August or September, of 1892.

Q. 1892?

A. Yes sir, I forget the exact date.

Q. Which end of the canal did they begin at?

A. Well that was in neither end; it was down on the lower half near to the village of Lamont.

Q. Do you know when the canal was completed in its present condition?

A. The water was turned into it, or it was accepted by the Governor of Illinois on the 17th day of January, 1900.

Q. Do you know when the water was first turned into it by the Drainage Board Trustees?

847 A. On the 6th day of January, 1900,—I don't mean into it; that was when the water first flowed through the controlling works.

Q. That was when the water first flowed through the controlling works?

A. Yes sir, the 6th day of January, 1900.

Q. Now do you know the volume of water, of cubic feet per minute that went through that canal on the 17th day of January?

A. I don't think I could give it. I have some flows, but they are average flows; they are not in detail by the days.

JUDGE SPRINGER: Three hundred thousand cubic feet a minute, wasn't it?

A. At that time, I don't think it was that much; I think it was considerably short then; they began a little gradually.

Q. ATTORNEY GENERAL CROW: Well if you can't find that, never mind.

A. I can't give it by the day; I can give you some data by the averages; by weekly averages.

Q. For what period of time?

A. From January 20, 1900, to March 30, 1901.

Q. You have got those averages, have you?

A. Yes sir.

Q. Where did you get them?

848 A. I got them from the reports of the printed proceedings of the Sanitary District Board.

Q. What was the average amount that went through there at that time? I don't care about the series of weeks—have you got the general average?

A. I think it is just as well to give them just as they stand here, or just as I have them. They can be averaged. The average for ten weeks from January 20 to March 31, 1900—that was flowing through the Chicago River, as given by their reports there, an average of 179,741 cubic feet a minute.

The average of thirteen weeks from March 31st to June 30, 1900, was 211,577 cubic feet a minute.

Thirteen weeks from June 30 to September 29, 1900, 210,317 cubic feet a minute.

For thirteen weeks from September 29 to December 29, 250,635 cubic feet a minute.

Thirteen weeks from December 29th, 1900, to March 30, 1901, 303,736 cubic feet a minute.

The maximum flow during that period occurred on March 16th, 1901, and was 356,723 cubic feet a minute.

Q. Do you know what the flow or the speed of the canal is, and what it was for the period of time you mention?

A. Yes sir, I have some data on that.

849 On June 20th, 1900, Major Willard, the United States Engineer in charge of the government work in Chicago, reported to the Chief of Engineers some data which was as follows:

When the river was flowing, he took these measurements at eight bridges; that was taking the narrow openings through the bridges, and this is the average for those. When there was a discharge of 150,000 to 210,000 cubic feet a minute, the average velocity was 1.79 feet per second, or 1.22 miles per hour.

ATTORNEY GENERAL HAMLIN: I believe I will object to this as not being competent,—not given by anyone who is competent to state as to that question.

Q. ATTORNEY GENERAL CROW: You took this information from the United States government report?

A. No sir, I took it from the reports of the proceedings of the Sanitary Board.

Q. Official records?

A. Yes sir, official records.

Q. For what year?

A. It was; this was published in the year 1900.

Q. Well, go ahead with it?

ATTORNEY GENERAL HAMLIN: Then I object to it on the ground that the official record is the best evidence and not the statement of the witness.

850 ATTORNEY GENERAL CROW: Q. Have you got a copy of that?

A. Not here; I have it in my office.

Q. Well, go ahead, and put this in; we can put the other in later on.

A. When the discharge was from 270,000 to 310,000 cubic feet a minute, the average velocity at the bridges was 2.72 feet per second, or 1.85 miles per hour.

Q. Now you are familiar with the conditions that exist there at 26th Street, where the pumping works are at the head of the Illinois and Michigan Canal,—the situation of the river there, the south fork of the Chicago River and the south branch of the Chicago river?

A. Yes sir.

Q. Now do you know what kind of water it was in 1900, January 1st, 1900, was being pumped out of that south fork, whether it was lake water or whether it was Chicago River water?

A. The pumps at the end of the Illinois and Michigan canal are on the south fork about a quarter of a mile south of the south branch of the Chicago River, which is the channel leading to the main drainage channel, and it takes its water from the south fork. The south fork is a very foul, black and malodorous stream and as fast as this water works out of the 851 south fork towards the south branch it is taken in by the pumps going into the Illinois and Michigan Canal, hence the preponderance of at least all that comes up to the capacity of the works from the south fork, goes into the Illinois and Michigan Canal when they are in operation.

Q. Well, do the same conditions exist now as did formerly with reference to that?

A. Yes sir, that condition exists now.

Q. Is there any perceptible current to the south fork of the south branch of the Chicago River in ordinary times?

A. No sir, you wouldn't detect it by looking at the stream. Of course there is.

Q. Is there any perceptible flow?

A. There is a flow due to the sewage and storm water that reaches that branch.

Q. Which way?

A. Well it flows northward, towards the south branch.

Q. Towards the south branch?

A. Yes sir.

Q. I believe you gave the depth of that this morning?

A. I think so, approximately.

Q. Do you know anything about the size or area of the stock yards district there on the south fork of the south branch?

A. Well I only know it—I have not computed it, if that is
852 what you mean.

Q. You have not computed it?

A. No sir, I haven't computed it. It could be done from that map.

Q. Do you know where the drainage from those stock yards goes?

A. The drainage from the stock yards is all into the south fork or the slips of the south fork at the head of the south fork.

Q. Now do you know whether or not the pumps of the Illinois and Michigan Canal are in operation now?

A. I couldn't answer for just at this moment.

Q. No, but generally?

A. But generally they are in operation. The Board of Canal Commissioners has taken possession of them and is putting in improvements there to operate them by electricity,—water power transmission from Joliet.

Q. Is it necessary to do that in order to flush out that south fork of the Chicago river?

A. No sir, it has no reference to that. They operate those pumps purely now for the purpose of navigation of the canal to keep the level of it, ostensibly at least that is what it is done for.

Q. Well, with the present flow of water through the
853 Chicago River, and the Drainage Canal, is the south fork
of the Chicago River yet stagnant water?

A. Yes sir.

Q. How about the appearance of it at this time?

A. Oh, it is black; absolutely black.

Q. Now at what point does the lake water enter the Chicago River that flows into the Drainage Canal?

A. No sir, through the mouth of the main river.

Q. Through the mouth of the main river; then in what direction?

A. This is westward to the south branch; thence the southward and again westward, through the Drainage Canal.

Q. Now the north branch of the Chicago River, that is the confluence with the south branch; it joins the stream of water from the lake coming westward, does it?

A. Yes sir, westward and southwestward.

Q. Is there a perceptible current in the North Branch of the Chicago River at this time?

A. I couldn't answer you just at the present time; there is at times, and at other times it is not perceptible.

Q. Is it affected by the storms?

A. It is affected by the storms, and affected by the operation of the Fullerton Avenue conduit; it is rather irregular—intermittent.

Q. Well, the Fullerton Avenue conduit, if the pumps are
854 at work there, what is the result?

A. When they are working, they put in near to 15,000 cubic feet a minute.

Q. What is the effect?

A. Which would make a slow velocity in the canal.

Q. When they are not at work what is the condition?

A. When they are not at work and when there is no storm water flowing, then it is stagnant.

Q. How long did you say that Fullerton Avenue conduit had been in operation?

A. It has been in operation I think, it was put into operation in the year 1879.

Q. What is the condition of the Illinois and Michigan Canal with reference to the appearance of the water therein?

A. The only times that I have seen it, since the main Drainage Canal was open it was apparently like it used to be before that channel was put into operation.

Q. Well how was that?

A. Very black and odorous.

Q. Well was there any flow in the channel?

A. Oh yes.

Q. Was there prior to January, 1900?

A. Yes sir.

855 Q. Was it rapid flow or slow?

A. Well, when they are operating the pumps to their rated capacity there is a flow of about a foot in a second. That would be about two-thirds of a mile an hour.

Q. Have there been any intercepting sewers built since January, 1900, in the City of Chicago, for the purpose of cutting off the sewage from the city that now drains into the lake, or that did drain into the lake?

A. None except the progress that has been made on the intercepting systems that they had in hand on Lawrence Avenue, and the Thirty-ninth Street system. They have been working on those.

Q. Well just explain what that system is?

A. The Lawrence Avenue system consists of an intercepting sewer beginning at the upper end of the sewer, at the north line of Lincoln Park, and running northwardly to Lawrence Avenue; and another one beginning at the city limits, or near the city limits, on the extreme north and running southward to Lawrence Avenue.

Q. And making connection?

A. With Lawrence Avenue, and on the line of Lawrence Avenue to the river, and the north branch of the river,—those intercepting sewer systems, I would say are built; that is the sewers I have described are built,—are finished, and the 856 Lawrence Avenue conduit is built within a few hundred feet of Clark Street. The remaining portion of it is not built.

Q. Well now what is the theory upon which that is to be operated?

A. That is to collect the sewage from all the sewers that enter into the lake on the north shore within the city limits, and conduct it through the North branch of the Chicago River.

Q. By way of?

A. Lawrence Avenue.

Q. The sewage from the North end of Lincoln Park upward to the Lawrence Avenue conduit?

A. Yes sir, and another one from the north line of the city to the Lawrence Avenue conduit.

Q. Down to the point of confluence of the Lawrence Avenue conduit, with the north Branch of the Chicago river?

ATTORNEY GENERAL HAMLIN: That is rather leading, General.

ATTORNEY GENERAL CROW: Yes, I know it is.

A. No, they lead down to Lawrence Avenue; these sewers don't go clear through the North Branch of the Chicago River, except the Lawrence Avenue conduit.

Q. What method is to be put into force for the purpose of
857 putting that into the Chicago River?

A. Pumps—by means of pumps.

Q. I believe you stated the level of the Lawrence Avenue conduit with reference to the river. What is it?

A. It is built below the lake level.

Q. What is it with reference to the river level?

A. Well, that is the same thing, substantially the same when we speak of below the level of the river and the lake.

Q. Now how about the 29th Street conduit?

A. The 39th Street conduit is laid out in the same way. There is an intercepting sewer starting on the south at 73rd Street running north on Stony Island Avenue and along the lake shore to 39th Street, and another one from 35th Street south to 39th Street. Those two sewers will collect all the sewage now flowing into the lake on the south shore of the city, and deliver the sewage at 39th Street. This system has been built from 39th Street south to 60th Street and is in process of construction. The conduit on 39th Street is finished with the exception of cleaning up, and the water from the lake and the sewage from that district is to be put through the 39th Street conduit with pumps.

Q. What will be the location of the 39th Street sewer or conduit at this point—at its point of confluence with the south fork of the south branch of the Chicago River with refer-
858 ence to whether it is on a level with the—

A. It is all below the river and the lake.

Q. What means have been provided for lifting that sewage into the south fork of the Chicago river?

A. They are providing pumps.

Q. Pumps?

A. Yes sir, and located at the lake.

Q. Located at the lake?

A. Yes sir.

Q. Do you know the population that would be contributed to that intercepting sewer on the north there, that is connected with the Lawrence Avenue conduit?

A. Yes sir, I have given it in my testimony, but I can give it again. It is 28,878 by the school census.

Q. 28,000?

A. 28,878.

Q. Is there an intercepting sewer connected with the Fullerton Avenue conduit?

A. No sir, there is no intercepting sewer connecting with that; that is, a few minor sewers along the line that may go into it, but not much.

Q. Do you know the population of the area that is connected with the 39th Street conduit?

A. Yes, from the school census, 178,182.

859 Q. What by the Federal census?

A. Well, that 16 per cent reduction which probably is too much for that part of the city.

Q. Well, make it on that basis?

A. I know it is too much on that basis; I would have to compute it. The population by the Federal census on that basis would be something less than 150,000.

Q. Do you know what place the sewage in January, 1900, and at this time, what district,—at what place it ran, or the territory embraced in that which will have its out-flow into the 39th Street conduit?

A. That is covered by this intercepting system you mean?

Q. Yes, 39th Street.

A. Why, it went into the lake.

Q. Into the lake?

A. Yes sir.

Q. It didn't go into the south branch of the Chicago River?

A. No sir, not without this portion of District 2 there, the part that I have been talking about.

Q. Well that is all that will be affected by the building of that intercepting sewer, that connects with the 39th Street conduit?

A. Yes, that is all that will be affected.

Q. Well now, considering that all those intercepting sewers were completed and the systems in operation, would there
860 yet be any of the population of Chicago that would have the out-flow of their sewage into Lake Michigan, and if so, how many?

A. There would be none direct from the outlet of Chicago, as some of the Chicago goes into the Calumet, and goes indirectly into the lake, but nothing direct into the lake.

Q. Is Evanston outside the city limits?

A. Yes, Evanston is outside of the city limits; it is a city of itself.

Q. Is that in the Sanitary District?

A. No, it is not in the Sanitary District.

Q. Calumet is in the Sanitary District?

A. No sir, but it is in the city.

Q. It is in the city?

A. Yes sir.

CROSS-EXAMINATION,

By Attorney General Hamlin.

Q. Well, Mr. Williams, I don't know as I want to ask you very much. The Illinois and Michigan Canal was constructed when?

A. I think it was in the forties some time, the exact time I haven't got. I didn't come expecting to be asked on that question at all. That is in 1840 something. It may have been
861 begun in 1837, or along there.

Q. When were these pump works established?

A. They were established about 1879 or 1880.

Q. And they have been in operation ever since?

A. Yes sir, at intervals, most of the time. There have been intervals when they did not operate.

Q. Well, from the time that they were put in operation up to the time the Drainage Canal was put in operation how much of the time were they in operation?

A. Pretty much all the time. There were some cases, I think where they were shut down, but not much; they were not shut down much.

Q. That was in 1879?

A. I won't say that that is the exact date that they were put into operation; it was near then; that was the time they were agitating it, and they may not have got into operation until 1880.

Q. Well, you know they were put in operation; after they were put in operation, under whose control were they?

A. They were under the control of the City; operated by the city until 1900.

Q. And the Illinois and Michigan Canal connects with the Illinois River, does it not?

A. In that way, yes.

862 Q. Through the canal it finally connects with the Illinois River, and the foot of the canal is at La Salle?

A. And connects with the Illiois River—yes,—I beg your pardon—yes sir, the out-flow, though of this summit level is into the Des Plaines River at Lockport.

Q. And it connects with the Illinois River?

A. It connects with the Illinois River, yes sir.

Q. Now after 1879, from 1879 to January, 1900, the north branch of the Chicago River carried sewage, did it?

A. Yes sir.

Q. To what point?

A. To the confluence with the main river, and with the south branch.

Q. Then where did it go?

A. Well, sometimes it went to one place; sometimes another; sometimes the lake, sometimes down the south branch.

Q. Well when these pumps were in operation where did it go?

A. The same answer, depending on the quantity of flood water reaching the river.

Q. Well now, the south fork, or the south branch of the

Chicago River, and the south fork of the south branch, reached the stock yards district, didn't it?

A. The South fork of the south branch reached the stock yards, yes sir. 863

Q. The stock yards at that time, say from 1879 up to 1900, were about the same size, continuously, were they not?

A. I think it is about the same, perhaps increasing some in the actual number of animals killed there.

Q. Do you know how that is; do you know about that?

A. I haven't got the statistics for it now, I have looked it up at various times, but I couldn't give them now.

Q. When these pumps were in operation from 1879 to 1900, what per cent of the sewage if you know, was discharged into the canal through the pumps?

A. That was variable; you take it in a dry time, when there was very little or no flood water reaching the Chicago River or its branches, and the pumps in operation to their capacity, which was then not far from 45,000 cubic feet a minute, when they were working to their full capacity, there would be none of the sewage that went into the river reached the lake, only such sewers as had their direct outlet into the lake, would reach the lake during that period, and during the conditions as I state them.

Q. What would they reach?

A. They would ultimately go into the canal.

Q. Through the pumping works?

A. Through the pumping works, yes.

864 Q. Now for how many years to your knowledge, you say you have lived in Chicago for thirty years—for how many years would you say that condition has existed?

A. That existed about twenty years; in that direct form part of the time, one way, and part of the time another.

Q. As you have explained?

A. Yes sir.

Q. And that sewage eventually reached the Des Plaines River?

A. Yes sir.

ATTORNEY GENERAL CROW: What per cent did he say went in there?

ATTORNEY GENERAL HAMLIN: He didn't give the percentage.

THE WITNESS: I said all that went into the river.

ATTORNEY GENERAL HAMLIN: He placed it on the condition of the streams.

Q. That has been about twenty years?

A. That was not far from twenty years.

Q. What did you say the flow was from Robey Street to Lockport in the Drainage Canal,—the rate?

A. I didn't give it.

Q. What did you say the fall was?

A. I said that the fall from Robey Street to as far as
865 Willow Springs, was at the rate of one in forty thousand,
and from Willow Springs to the Controlling Works, one in twenty thousand.

Q. Then did you state what the fall was from Robey Street to the Controlling works?

A. The total fall?

Q. Yes sir?

A. In feet, I put it, I think it was 5.55 feet; that is the bottom of the canal.

Q. Yes, I understand.

A. That don't necessarily mean that that is the water surface at all.

Q. These sewers, these intercepting sewers that are to finally connect at Lawrence Avenue and at the other points that you mentioned, have not yet been constructed and are not yet in operation, are they?

A. They are not in operation; they are partly constructed.

Q. Yes, but they are not in operation?

A. No sir.

Q. And the sewage that they will carry is now going directly into the lake?

A. Yes sir.

Q. Well, they were not in January and February and March
or say the first three or four months of 1900, they were not
866 even in process of construction, were they,—some of them?

A. I think they had begun work on them at that time. Yes, I am sure they had, on parts of them. I think that they had all the contracts let, and some considerable part of the work done.

Q. Can you tell in point of population how many, taking into consideration these sewers that have been constructed, in point of population, how many of population drain into the lake; that the sewage went into the lake?

A. Well, based on the United States census, would be not far from 150,000.

RE-DIRECT-EXAMINAITON.

By Attorney General Crow.

Q. I would like to ask him a question, or you can ask it for me, if you will. I have not had him describe,—I don't know whether he can,—what the controlling works at Lockport are; we ought to put that in the record here, somewhere, so that when we talk about the controlling works, we will know what they mean.

ATTORNEY GENERAL HAMLIN: He has stated where that is.

ATTORNEY GENERAL CROW: He has not described them, you know. You know that, do you?

A. Yes sir.

ATTORNEY GENERAL HAMLIN: You can ask him to describe them.

Q. ATTORNEY GENERAL CROW: Well, I will ask 867 him to describe them then, the controlling works at Lockport?

A. The controlling works consist of seven sluice gates, that is, they are gates that move in guides and are operated by certain mechanical appliances. Each of those gates has an opening of thirty feet, clear opening.

Q. Thirty feet in width?

A. Thirty feet in width, yes. Now those gates were not all in use; they have not needed to use them, but they are there as a reserve, when the flow becomes so great that they may need them. Then the only appliance relied upon for the main control now, is what is known as the Bear Trap Dam, which is 160 feet long; that is, in its horizontal section, and it has an oscillation vertically of seventeen feet.

Q. What do you mean by that? Explain that?

A. Well, the dam is made out of steel, a steel caisson, and the upper edge of that points up-stream can be lowered or raised by the water. By letting in underneath the dam, the water, it will be raised by letting that water out into the tail race, it will be lowered so that that dam can be oscillated just by operating valves.

Q. Up and down?

A. Up and down.

Q. How much of the seventeen feet?

868 A. Over a range of seventeen feet.

Q. That is to say you can make a difference of seventeen feet in the amount of water in the face of the trap?

A. No, I don't mean that. No, I mean that if you put the dam down to the lowest point it will be seventeen feet below what would be if it was at its highest point. It might not lower the water materially in front of it, it would be just pouring out as a mass over that dam you know, a good many feet deep.

Q. You described what those sluice gates were, didn't you?

A. I have told what they were; what they consisted of, yes sir.

Q. Now that is all of the appliances that there are there?

A. That is all of the appliances there are there.

Q. Now where is the town of Lockport located with reference to this dam and these sluice gates?

A. It is located off to the southeast.

Q. Off to the southeast?

A. Yes sir.

Q. Now does the Illinois and Michigan Canal lie between the drainage canal and the town?

A. Yes, partially so. At this point the drainage canal is off from the Illinois and Michigan Canal a considerable

869 distance.

Q. But between the town and the Drainage Canal?

A. To go to the town you would have to cross the Illinois and Michigan Canal.

Q. Do you know the largest amount of water that can be discharged through these sluice gates and over the Bear Trap dam?

A. I never have computed it, but I have no doubt that depending upon the height of the water in the channel above, I suppose it is good for 800,000 or 1,000,000 cubic feet a minute.

Q. In other words you suppose it is made to equal the capacity at the Intake of the Canal at the mouth of the Chicago River?

A. Yes sir, to more than equal it.

Q. 800,000 cubic feet, that is per minute?

A. Per minute, yes sir.

JUDGE SPRINGER: In short, then Mr. Williams, these controlling works at the Bear Trap Dam were constructed for the purpose of controlling the amount of water that passed out of the canal into the Des Plaines River?

A. Yes sir.

Q. What is the necessity for controlling that outlet of
870 water?

A. Sometimes they would want to shut it off entirely possibly, and sometimes you must limit the flow through the river, and as a matter of fact that is what they have been compelled to do all the time, by the United States government. They have had to cut down the flow through the Chicago River in accordance with the standard set by the Secretary of War, and it is only by means of this controlling works, that they could do that.

Q. Without these controlling works then, there would be a tremendous flood?

A. It would simply run wild, you might say, that is, it would simply flow all that the hydraulic conditions would allow.

Q. And become a menace to property?

A. Until it would flow all the water that could go through the river and canal under the conditions of cross section and head and fall, and all of that. That is, in other words, it would do like a river itself; it would take its uniform flow and you would have no control over it.

Q. And this was a measure of precaution for the purpose of controlling the out-flow of water at all seasons?

A. Yes sir.

JUDGE SPRINGER: That is what I wanted. That is all.

ATTORNEY GENERAL CROW: That is all Mr. Williams.

871 **DR. WALTER C. G. KIRCHNER,**

Called as a witness in behalf of the complainant, being first duly sworn, was examined in chief by Attorney-General Crow and testified as follows:

Q. Now what is your name?

A. Walter C. G. Kirchner.

Q. What is your occupation?

A. Physician.

Q. Where do you live?

A. 1211 North Grand Avenue.

Q. How long have you been a physician?

A. For nearly two years.

Q. Do you occupy any position here in the city?

A. I am senior physician at the City Hospital.

Q. At the City Hospital?

A. Yes sir.

Q. What is your age?

A. Twenty-eight.

Q. Do you know Dr. Amand Ravold?

A. Yes sir.

Q. Did you assist him in any bacteriological work connected with the examination of waters of the Illinois and Missouri and the Mississippi rivers and the Chicago drainage canal and the Des Plaines river and Lake Michigan?

872 A. Yes sir.

Q. What waters did you assist him in investigating; do you know what particular waters?

A. Ocasionally the Chicago river, the Des Plaines river; the Drainage Canal itself; the Illinois and Michigan Canal; Illinois river, Missouri river and Mississippi river.

Q. What portion of the work did you do?

A. I worked and assisted mainly in quantitative analyses of the water.

Q. What do you mean by that?

A. Principally the determination of the numbers of bacteria.

Q. Is that what they called the plate-work?

A. Yes sir.

Q. Now just describe what that is, will you?

A. It consists in plating a certain quantity of water to be examined, which, if necessary is diluted to the proper amount and is mixed with culture media, and introduced into a so-called Petri dish and put into proper surroundings so that the bacteria may grow.

Q. Well now, you began working with Dr. Amand Ravold on this matter about the 10th of August, 1899, didn't you?

A. I think it was that date.

873 Q. And that examination ended in October, 1899?

A. There was a short period when I conducted an examination at the Intake, I don't know whether you referred to that or not.

Q. That is the time, at the Intake?

A. Yes sir.

Q. Do you remember how many samples of water were taken there?

A. I do not.

Q. Well, there were thirty-four samples taken. Now do you know how often those samples were taken at that place?

A. They were taken daily and sometimes twice daily for the period of investigation.

Q. That was at the Intake tower of the St. Louis Waterworks?

A. Well, do you mean the exact place at which the samples were collected?

Q. Yes.

A. Well the majority of the samples at that place were taken from the so-called Uptake.

Q. Uptake—what do you call the Uptake?

A. The uptake is a well on the shore.

Q. On the shore?

874 A. On the shore, which contains practically the same water as that in the Intake.

Q. Well this well is connected by tunnel with the Intake, 1,500 feet out in the channel of the Mississippi river?

A. Yes sir.

Q. Now what was done with those samples of water when they were taken out?

A. They were taken to the laboratory which was located at the Chain of Rocks.

JUDGE SPRINGER: Did this witness take these samples himself?

THE WITNESS: Yes, I took these samples myself.

Q. Now state where you took them then.

A. These particular samples were taken at the Chain of Rocks.

ATTORNEY-GENERAL CROW: Now you had a temporary laboratory at the Chain of Rocks?

A. Yes sir.

Q. Now what did you do with those samples?

A. They were plated in the usual way and after a proper period of incubation, counted.

Q. Who did the counting?

A. I did the counting.

Q. You did all the counting for that period of time, did you?

875 A. Yes sir.

Q. Do you recognize that work (handing witness paper)? It is a table of collection of water, read the top of that.

A. "Results of quantitative determination of bacteria in samples of water collected at different points near the Intake of the St. Louis waterworks, located at the Chain of Rocks—bacteria per cubic centimeter; date of collection and place of collection of samples."

Q. Well, is that the lot of samples of water at that place that you helped to collect?

A. Well this looks very much like the work that I had been doing, without referring specially to it; it covers the work that I had done there.

Q. Well, you made your reports direct to Dr. Ravold?

A. Well, this particular report was made to the Water Commissioner.

Q. The water commissioner?

A. Yes sir.

Q. Who was the Water Commissioner?

A. Edward Flad.

Q. Did you report to him?

A. This particular report was made to him.

Q. You reported it to him—did you report to him or did Dr. Ravold report to him?

876 A. Well this particular report went to Mr. Flad.

Q. From you?

A. Yes sir.

Q. You didn't give it to Dr. Ravold?

A. Well the work was done under Dr. Ravold's direction.

Q. Well, it was turned over to Dr. Ravold then, wasn't it, and he carried it to the water commissioner?

A. I think that was the understanding.

Q. You made a report of the work you did to Dr. Ravold, as your superior officer, didn't you?

A. Well at that time my report stated, it went to Edward Flad, who was then water commissioner.

Q. What did you do with it? It doesn't matter what it stated.

A. Why, I gave it to the Water Commissioner.

Q. Then you didn't give it to Dr. Ravold?

A. No, I didn't give it to him except for verification.

Q. Was there an official report made?

A. Why this was to be the official report.

Q. It was to be?

A. It was.

Q. Is that true of all collections you made during this period of time?

A. No sir.

Q. Up to October, 1899?

877 A. Up to October, 1899, yes sir.

Q. That is true of all those?

A. Yes sir.

Q. I will get these reports that you made and let you identify them. Now the next period of time. During that same period however, you took—there was thirty-two other samples of water taken at different points on the Mississippi and the Illinois River; did you participate in that?

A. Yes sir.

Q. Where were those taken from, on a boat or on the land?

A. They were taken from a boat.

Q. In what river?

A. In the Mississippi River. You are now referring to this first period of examination?

Q. Yes. Any other place besides the Mississippi?

A. I am not sure whether we went up the Missouri River or not. I can't recall the time just now.

Q. Now what became of these reports; were they given to Flad too?

A. I don't recall that exactly. I have not gone over that.

Q. You don't know?

A. I haven't gone over that recently and can't tell posi-
878 tively.

Q. Who had charge of that work, you or Dr. Ravold?

A. Dr. Ravold superintended the work, though I reported to the Health Commissioner, or to the Water Commissioner.

Q. Well, did you take these thirty-two samples from the river?

A. This is the first period of work?

Q. Yes?

A. Yes sir.

Q. From a boat—You don't understand me, do you?

A. I don't quite understand, no sir.

Q. I am asking you now about the samples of water that were taken on the boat—did you take those samples from the river,—from the Mississippi and the Illinois River?

A. Why all the bacteriological samples that were taken on the boat, I took in conjunction with Dr. Ravold, and I did all the quantitative work that was done.

Q. Well, did you take the water from the river?

A. I took the water from the river, yes.

Q. That is what I am trying to get at. All of them?

A. Yes sir.

Q. You did it alone? Anyhow, you took the samples on the boat and examined them, did you?

A. Yes sir.

Q. How were the samples taken—in bottles?

A. Yes sir.

879 Q. Didn't you have an apparatus that you collected them with?

A. Yes sir.

Q. Then were they transferred from the apparatus into the bottles?

A. The bottle was placed into the apparatus.

Q. And then you transferred the bottle?

A. Transferred the bottle to the proper receptacle.

Q. What did you do with the bottle after you took it out of the apparatus?

A. The bottle was sealed.

Q. And then you transferred the bottle?

A. We had a laboratory—a temporary laboratory on the boat.

Q. And you proceeded to make these analyses of the water there?

A. Yes sir.

Q. They were what you call plated on the boat, were they?

A. Yes sir.

Q. Now did you help do any work under the supervision of Dr. Ravold between January 23rd and October 11, 1900, in the Illinois River and the Mississippi River, and at the reservoir at the chain of rocks?

A. Yes sir.

Q. Now do you know who took these samples of water
880 from the River?

A. I do not.

Q. You don't know that?

A. No.

Q. Well, do you know where you did the work?

A. That work was done at the Medical College, I believe.

Q. What time?

A. At that time, we did it at the St. Louis medical college.

Q. All of it; was it all done there?

A. Later I think, the second portion of the work was done at the Old City Hall, what is now the Old City Hall, the Health Department.

Q. What part of the work did you do?

A. I did mainly the quantitative work.

Q. What do you mean by that?

A. I mean the counting of the bacteria.

Q. You didn't plate the bacteria?

A. Oh yes, that belongs to the quantitative work.

Q. This is part of the quantitative work is it?

A. Yes sir.

Q. From whom did you receive these bottles?

A. These bottles were received by—I received these from the collectors,—special collectors for this purpose.

881 Q. Well, did you open the bottles?

A. Yes sir.

Q. Then what did you do?

A. I took out the quantity of the water under the regular bacteriological conditions, and put them through the process of plating.

Q. How much water did you take out?

A. I almost uniformly took out one cubic centimeter of water, which was diluted under proper conditions, so that counting would be possible.

Q. What was the object of diluting the water?

A. So that in case the bacterial number should be very great the bacterial growth on the plate would be such that it could be more rapidly counted.

Q. Well, what was it that you diluted the water with?

A. With steriled water—steriled water was used in diluting.

Q. Was there a tag put on the bottles?

A. All of these bottles were tagged and labeled.

Q. What with?

A. The location, the time of collection, temperature of the water and temperature of air, and the name of the collector and such other information as the collector would sometimes obtain.

Q. Well, did you keep a record of all this matter and also of the plating?

882 A. All of these tags were filed, and the record of the counting was also kept in a special book for the purpose.

Q. That is the result of your work?

A. Yes sir.

Q. That was the official record of it, was it?

A. Yes sir.

Q. How many plates did you make from that set?

A. It was a rule to make duplicates; make the plates in duplicate.

Q. And then how did you get the results; did you count both plates?

A. Both plates were counted and an average was struck.

Q. At what temperature were the plates kept?

A. They were kept at a temperature of about eighteen to twenty degrees centigrade.

Q. For how long?

A. I usually counted on the third day; that was a little over forty-eight hours.

Q. Then where was this official record—who was it filed with?

A. It was filed with Dr. Ravold.

Q. Dr. Ravold?

A. It was placed in Dr. Ravold's hands.

Q. You did all of that plating between the period of
883 January 23 and October 11, did you, 1900?

A. Yes sir.

Q. Were you at Joliet, Illinois, doing bacteriological work under Dr. Ravold in the autumn of 1901, between the dates of October 1st and November 22?

A. Yes sir.

Q. At what place in Joliet were you?

A. Our laboratory was on—the exact number, I don't know—it is North Joliet Street.

Q. Were you working under Dr. Ravold at that time?

A. Yes sir.

Q. Did you make your reports to him?

A. Yes sir.

Q. Now do you know where the water came from that you examined bacteriologically?

A. It was usually submitted to me by the collectors.

Q. Well, do you know where they brought it from?

A. And it came from the various sources, the Des Plaines River, the Illinois & Michigan Canal, the Drainage Canal itself.

Q. What was the exact location of the place?

A. The exact location of the place that was taken from where this principal street crosses the—I don't remember the name of the street,—Ninth, perhaps, where the principal street crosses the Illinois & Michigan Canal on the way to the
884 Bear Trap Dam, controlling works,—Ninth Street.

Q. Well, were these bottles that you received, tagged?

A. Yes sir.

Q. What did the tags show?

A. The tags showed the date, the name of the place of collection, the temperature of the water and of the air; name of the collector, and possibly such other information as would be useful. At the Bear Trap Dam the regular readings or reading of the gauge, and such other information was also recorded on the tag; the condition of the water was also noted and recorded.

Q. Did you collect any water in Joliet?

A. Yes sir.

Q. Did you do that or did you have it done?

A. Occasionally I would collect myself, and more often the collectors. I would do some collecting, but more often the collectors sent me the bottles.

Q. What did you do with these samples after you received them, in the bottles of water?

A. These samples were plated immediately.

Q. Who did that?

A. I was the one who plated the samples.

Q. Did you collect samples at any other pla

885 A. Samples were also collected below Joliet at what was called Brandon's Bridge.

Q. What did you do with those samples?

A. Those samples were plated in the usual way immediately upon their arrival at the laboratory.

Q. Were they tagged?

A. They were also tagged.

Q. Did you make an official report of all that work to anybody?

A. All this work was embodied in a report and sent to Dr. Ravold.

Q. Did you send out all the bottles in which samples were collected, at Joliet?

A. Yes sir.

Q. Were those bottles sterilized before they were sent out?

A. Yes sir.

Q. In what way?

A. They were put into a hot air oven and sterilized at a high temperature for an hour.

Q. Do you belong to the health department of this city?

A. Yes sir.

Q. Then can't you get those official reports of your work and bring them down here tomorrow morning?

A. I think I can.

Q. In whose department are they? Are they in Mr. Francis'?

886 A. I think so.

Q. Or are they in the Bacteriological Department?

A. I think they are in Mr. Francis' charge.

Q. Will you get them and bring them down here so we can utilize them in the morning?

A. Yes sir.

ATTORNEY GENERAL CROW: You can cross-examine. I want the privilege of putting him on again in the morning on these reports.

JUDGE SPRINGER: Yes, certainly.

CROSS-EXAMINATION,

By Judge Springer.

Q. You stated that these samples at Joliet were taken by collectors, is that right?

A. Yes sir, some of them; in fact most of them.

Q. Most of them were?

A. Yes sir.

Q. What proportion of them did you take yourself?

A. I don't know; occasionally I would go with the collectors and see that the work was properly done; in fact I would quite frequently go with them to inspect their work.

Q. Go where?

A. Go with the collectors and assist them in collecting the samples.

887 Q. To what places did you go with the collectors?

A. To all the places at which samples were collected; that is to say while I was in Joliet.

Q. How much of the time were you engaged at Joliet in making these examinations and collections of water?

A. Well I spent all my time in this work; in this bacteriological work.

Q. How long was that?

A. I don't remember the exact date, but for this period of October to about December,—beginning of December.

Q. What proportion of these samples did you collect yourself or participate in collecting?

A. I can't tell exactly, but as I said before, I frequently went with the collectors to superintend the work.

Q. You couldn't tell whether you collected half of them or one-quarter of them, or any other part of them?

A. Well, I feel sure it was more than one-quarter.

Q. The samples that were collected by the collectors and brought to you were unknown to you except as to what the labels showed on the bottles?

A. Yes sir.

Q. Do you know how much time elapsed between the time of the taking of these samples in the water, and the time they were plated in your laboratory?

888 A. I can't tell exactly; the records will show that. They were plated usually as soon as possible upon arrival at the laboratory.

Q. Well how much time elapsed?

A. In some case, in those samples that were collected in Joliet, or near Joliet, those were often plated within fifteen minutes after collection.

Q. How about those collected at the Bear Trap Dam, Lockport?

A. Well, those samples were transported from the Bear Trap Dam to the laboratory, and it usually took—well, I can't tell exactly either, but it took possibly more than an hour for the samples to arrive.

Q. How were they brought?

A. They were brought properly sealed and tagged, packed in ice.

Q. By what means of transportation I mean?

A. They were brought in a buggy which had been hired for that purpose—horse and buggy.

Q. How many miles was it from Lockport to Joliet?

A. I don't remember exactly, possibly eight or ten miles; I don't remember exactly.

Q. Did you note, doctor, what kind of bacteria you found in those samples that you took or examined in Joliet?

889 A. Well, I did examine a number of the cultures as to the coli communis, but I didn't make it a point to make a qualitative analysis, that is to say, determining the kind of bacteria. Of course I incidentally met with some organisms that I was acquainted with.

Q. Your examination then was principally quantitative?

A. Yes sir.

Q. If you made any examination as to the quality of the bacterial, state what it was,—what you found?

A. I found that in the majority of samples examined, coli communis was present—the bacilli coli communis.

Q. Did you make any experiments with those bacteria, the bacilli coli communis, to ascertain whether they were virulent or not, or whether pathogenic or not?

A. No sir, I did not.

WALTER W. KIRCHNER.

890 **EDWARD JAMES RAVOLD,**

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Attorney General Crow, and testified as follows:

Q. What is your name?

A. Edward James Ravold.

Q. Where do you live?

A. 2806 Morgan Street this city.

Q. You are a brother of Dr. Ravold?

A. Yes sir.

Q. Have you any recollection of being employed by Dr.

Ravold, your brother, to go up the Illinois River in the autumn of 1901 and collect samples of water?

A. Yes sir.

Q. Do you know what time that was?

A. Well that was about—that was in the latter part of November of the same year.

JUDGE SPRINGER: What year?

A. 1901.

Q. ATTORNEY GENERAL CROW: Do you know about what day of the month you commenced?

A. Well, it was along about—I don't know exactly the date.

Q. Well, approximately?

891 A. Along about the 10th some place, I started out.

Q. What were your duties under that employment?

A. Well I was instructed to take samples of the water that was flowing from streams into the Illinois River.

Q. Beginning at what point on the Illinois River?

A. Well, I started in at Grafton, and began to go right straight up.

Q. That is the mouth of the Illinois River?

A. That is the mouth of the Illinois River, and every river flowing into it of any size, I took water from it; I would go quite a distance up the river and take samples.

Q. Did you travel on a boat?

A. Yes sir, there was a Captain Fluent had a boat at Alton, and he started up the river, left Alton and went right straight up the river and when we came to a river of any size, we would go up the river as far as we could get—we had a twenty foot naptha launch,—and we would go up the river and get out into the stream and take a sample.

Q. What was done after you took the sample?

A. We tagged it.

Q. How would you take the sample?

A. We had a large bottle with us; we took the sample of water and the bottle was tagged; we took the temperature of the water at the time, and the time of the day that it was

892 taken, and that water was sent to Dr. Whipple, in Brooklyn.

Q. New York?

A. Yes sir.

Q. Who sent it?

A. I sent it.

Q. How did you send it?

A. Why, I crated it; that is the bottles were put in a large box and the box was sealed, and each bottle, as the sample was taken, the cork was sealed; that is, a wax label was put on it, or a wax seal.

Q. Was this packing and shipping done after the water was all collected?

A. Why, how do you mean—after it was sent to Mr. Whipple, oh, no. When I got up to Joliet, I shipped the water from Joliet that I had collected up to that point, right straight up the river.

Q. Well, did you ship any from Peoria—you got to Peoria before you got to Joliet, didn't you?

A. Certainly. Peoria was the first shipment.

Q. Well, you shipped water from Peoria first?

A. Yes sir.

Q. And that which you got between Peoria and Joliet you shipped from Joliet?

A. Yes sir.

893 Q. And this occurred right up around there as far as you went?

A. Well, I stopped when I got up to where there weren't any more rivers, when I got up to the canal.

Q. When you got up to Lockport?

A. Yes sir.

Q. Then what did you do?

A. Then I came home.

Q. Then you came home?

A. Yes sir.

Q. How far did you go up the river?

A. I went up to—we went up to Ottawa is where we stopped in the boat.

Q. How did you get the rest of the samples above Ottawa?

A. I had to take a train.

Q. Well now, at what other points did you collect above Ottawa?

A. Why there was three rivers above that—

Q. Three rivers?

A. Yes sir.

Q. What were they?

A. Well, the Fox River is the first river above that, that we took; that is right there just a little bit above Ottawa—in fact it almost flows through Ottawa.

894 Q. Did you get any from the Kankakee River?

A. Yes sir, we took that.

Q. LePage River?

A. We took the LePage, yes sir.

Q. Any other streams? Where is the Vermillion River?

A. That flows in above there too; we also got that.

Q. Any other streams?

A. Well that has been over a year ago, you know.

Q. Did you take any from the Des Plaines River?

A. Yes sir, we got one from that river too.

Q. Well, generally speaking, did you take them from all tributaries flowing into the Illinois River?

A. All tributaries flowing into the Ilinois River, we got a sample of.

Q. You shipped these samples sealed and crated, to Dr. Whipple?

A. Dr. Whipple.

Q. What was his first name?

A. I don't know.

Q. William C. Whipple, wasn't it?

A. I think it was George Whipple.

Q. George Whipple of Brooklyn, New York?

A. Yes sir.

Q. Now do you know whether he received them?

895 A. Oh yes, I know he received them. My brother told me he received them.

Q. Were they shipped in your name?

A. Yes sir.

Q. Did you sign the tag?

A. Yes sir.

Q. On the bottle?

A. Yes, I signed every tag. You know there is a small little tag put on every bottle and I also signed that, and I got a receipt from the express company.

Q. How much water was in a bottle?

A. Like one of these crystal water bottles; I don't know how much exactly.

Q. About a gallon?

A. About a gallon, I should judge, yes.

Q. Do you know how many samples you collected?

A. Well I couldn't state exactly, but it seemed to me it was around twenty-one, samples I think.

Q. Up to that point or altogether?

A. Altogether.

Q. Now did you—

A. I wouldn't be sure of that.

Q. Did you take any from the Illinois River?

A. Illinois River,—no, they were taking samples in the Illinios River all along you know.

896 Q. Well, did you take any?

A. No sir, I don't think I did.

Q. Did you take any water out of Lake Michigan?

A. No sir.

Q. Did you collect any water at Grafton for your brother, Dr. Ravold?

A. Yes sir.

Q. Did you collect any for Dr. Tiechmann?

A. Yes sir.

Q. Did you make collections for chemical—

A. I made both bacteriological and chemical collections.

Q. How did you collect that water?

A. Why I would get up at five o'clock in the morning and take two bottles, two of these large bottles, you know; that is chemical bottles, and two of the small bacteriological bottles and walked up—first I rowed up—I found that was too hard you know, so when it would be very high—sometimes about a mile or probably a mile and a half up to where there is an Island—

Q. In the Illinois River?

A. In the Illinos River, where the Illinois and Mississippi come together there, I would go up there. There was a man there by the name of Homer, had a little boat—he was a fisherman up there and I hired his boat, and at first I collected 897 both samples, I would go up there, go up into the Mississippi River—in the Mississippi first and get a sample of water—

Q. Well, you would get a sample for both Dr. Ravold and Dr. Teichmann, of the Mississippi river water?

A. Yes sir.

Q. Did you do that?

A. The chemical water for Dr. Teichmann—that is the big sample, you know.

Q. That is what you got in the Mississippi river?

A. That is what I got in the Mississippi. Then I came down and got the bacteriological sample in the Illinois river.

Q. But you didn't get both the chemical and bacteriological sample in the Mississippi?

A. No sir, I don't think I did.

Q. Were those tagged the same as the others?

A. They were tagged the same as the others.

Q. What did you do with them?

A. I just came down in time to catch the first morning train out of Grafton and shipped the water in here, so they got the water around about ten o'clock.

Q. Were all the bottles sealed?

898 A. Yes sir, sealed with a stamp.

Q. With a stamp?

A. Yes a stamp—with a city stamp.

Q. With wax?

A. With regular sealing wax, yes sir.

Q. You collected there from the first of December to about the middle?

A. Yes sir, 15th, I think it was, yes sir. You know after I made these trips—

Q. Did you take any hourly or half hourly samples at that point?

A. Oh yes, that is what I was going to get at. I found out I could hire this man to take day and night samples, every hour of the day and night.

Q. This man Homer?

A. Yes. I think it was to be so much whether he was to work day and night or day, and so I let him take samples day and night?

Q. Every hour?

A. Every hour he took these samples.

Q. Now where did you take them?

A. In the Illinois river.

Q. Now what samples?

899 A. These were bacteriological samples.

Q. Only?

A. Only. These were taken every hour.

Q. Continuing during the same period, all the time that you were taking samples for both chemical and bacteriological work?

A. Yes sir—well, half of the samples that I took the first thing in the morning.

Q. Do you know of your own personal knowledge that this man Homer did this work?

A. I was there and saw that he did that work, yes sir.

Q. Did he seal the bottles?

A. No, I sealed the bottles.

Q. He brought the bottles to you and you sealed them?

A. Yes sir.

Q. They were sent to whom?

A. They were sent to the City Chemist's office.

Q. To the City Chemist's office?

A. Yes sir.

Q. That is the bottles that Homer brought to you and you sealed?

A. Yes sir.

Q. To whom did you send your bottles?

A. To Dr. Teichmann.

900 Q. Bacteriological as well as chemical?

A. Yes sir.

Q. How did you send them, by express?

A. Yes sir.

Q. On what railroad?

A. The railroad that runs out of Grafton there—the Bluff Line, I think it is—Peoria and St. Louis.

Q. You didn't keep any record of this work?

A. How do you mean?

Q. Have you got a record of this work?

A. Oh, I kept a record of everything that I did, yes sir.

Q. Where is that record?

A. It is out at the house.

Q. Will you bring that down tomorrow, or send it down?

A. Why yes, I can do that.

Q. You made a memorandum, did you? At the time?

A. I think I have it out there, yes.

Q. You give it to the doctor and let him bring it down?

A. Yes sir.

CROSS-EXAMINATION, By Judge Springer.

Q. Mr. Ravold, did you sterilize the bottles which you used for taking these samples, before you put water into them?

901 A. These bottles were all handed to me by Dr. Teichmann.

Q. Well then if they were sterilized you knew nothing about it?

A. That was all done by them I should judge, yes sir.

Q. You simply took the bottles that were furnished to you?

A. I merely took the samples, yes.

Q. What kind of bottles were furnished you?

A. Why, it was a bottle, something like one of these crystal water bottles.

Q. Do you know how much they held each?

A. I should judge they were about a gallon.

Q. Were there more than one size?

A. No sir, they were all the same size.

Q. What kind of bottles did you use?

A. For which samples?

Q. For taking samples. I am asking for all the different kinds.

A. Why there was a small bottle taken for the bacteriological sample.

Q. How much did that hold?

A. Well I don't know; I think about a cupfull, I should judge.

Q. A pint?

A. I don't think there was that much in it. There might have been.

902 Q. How much would the other size hold, the next size?

A. Well, those large ones, they would hold about a gallon, I should judge.

Q. Were there three sizes or two?

A. There were two sizes.

Q. How many bottles did you take at each place?

A. Now which samples are these?

Q. Well, I am asking you.

A. I know, but which sample, when I was at Grafton or when I was going up the river?

Q. I am speaking about Grafton now.

A. Oh, why those samples were the same size, that I took chemically, those taken in the morning, and the samples that were taken for the bacteriological work were both the same size.

Q. How far up the mouth of the Missouri river did you go before you took your samples?

A. Missouri—I wasn't in the Missouri.

Q. Mississippi river I mean. Excuse me, up at Grafton, Mississippi river at Grafton?

A. Well, I don't know how far above it was; it was above that island there, where that island comes in.

ATTORNEY-GENERAL CROW: The Judge doesn't know where that is. Just give him an idea, just where it was.

903 A. It is about two miles above where the Illinois and the Mississippi river join, there at Grafton.

JUDGE SPRINGER: Q. Two miles above the confluence of the Illinois and Mississippi rivers?

A. It looked to be about that.

Q. How far out did you go into the stream?

A. Into the middle of the stream.

Q. Into the middle of the stream, for all your samples?

A. Yes sir.

Q. How deep down into the water did you go to take your samples?

A. Well, we went down a little more than a foot; foot and a half probably.

Q. How did you proceed to get the water at a lower depth than the surface?

A. Why, the samples that were taken bacteriologically were taken with a machine that was made purposely for that.

Q. What kind of a machine is that?

A. I can make a drawing of it.

Q. The one that was in here the other day?

A. I wasn't here the other day. It was a machine that you can pull the stopper out when it is under the water, you can pull the stopper out and then let it loose; then it corks up so no water comes into it.

904 Q. You inserted this apparatus into the water at what depth?

A. The machine was about that tall (indicating), say three feet, and we put that down in quite a depth down to my hands, and put the sample in and took it out; I don't know what the depth was, I didn't measure it.

Q. How far down do you think it was?

A. If I had the machine here I could measure it and tell you.

Q. Well you could give some idea of it without having the machine, whether it was one foot, two feet or three feet?

A. Those bacteriological samples were taken three feet under the water.

Q. Three feet under the water?

A. Yes sir.

Q. And what did you do with the samples when you took them?

A. The samplse were taken and sent to Dr. Ravold; that is, they were sent to the City Chemist's office.

Q. You sent all of them to him?

A. Yes sir. They were sent to Dr. Teichmann of course, that is the man that the label was shipped under; they were shipped to Dr. Teichmann, and from Dr. Teichmann they were turned over to Dr. Ravold.

Q. Did you use any means for keeping them cool while 905 they were in transit?

A. Why yes.

Q. What was it?

A. Up until when I got up there it was very, very cold, when I was up there; at first they were shipped in ice; they were packed in ice.

Q. You did that yourself?

A. Yes sir.

Q. What time of the year was this?

A. Well this was along about—from the first to the 15th of December; it was very cold weather.

Q. Well how long a time did you spend at that point?

A. I should say about fifteen days, I should judge.

Q. Did you send one every day?

A. Every morning, yes sir.

Q. Every morning?

A. Every morning, yes.

Q. Well that completed your work at Grafton?

A. At Grafton, yes sir.

Q. Now tell me about what time—about the time when you went up the river to take the samples in the streams emptying into the Illinois river; when was that?

A. I don't know exactly the date; it was along about, I should judge about the middle of November we started in, 906 and we went until probably about the 10th, I should judge won't say for certain, along in there some place; we went right straight up.

Q. Where did you get the bottles used on that expedition?

A. Those bottles were delivered to me here; that is, they were shipped to Alton. I received them at Alton and went right straight off with them.

Q. You know nothing then about how they were prepared?

A. No, I don't; I wasn't hired—I was only hired to take the samples.

Q. Just to take the samples?

A. Yes sir.

Q. Well how far below the surface of the water did you take those samples?

A. Those were taken eighteen inches under the water.

Q. Eighteen inches under the water?

A. Yes sir.

Q. Where were they taken with reference to the stream itself?

A. In the middle of the stream.

Q. In the middle of the stream?

A. Yes sir.

Q. How far above its confluence with the Illinois River?

A. Well it varied; the larger the stream was, the higher up the river we went; some streams we went two miles up the river.

907 Q. Did you go far enough up to keep out of any possibility of mixing the waters of the stream out of which you were taking the samples, with the Illinois River?

A. That I don't know; you mean in the rivers that were flowing into the Illinois River?

Q. Yes sir.

A. Oh yes, I am pretty sure we got above that.

Q. You aimed to get above the mixture of the waters of the two streams?

A. Yes sir.

Q. You continued taking those samples from the mouth of the Illinois River and the Des Plaines River?

A. Yes sir, right straight up.

Q. That is the last one, isn't it?

A. I think that was the last one, I took, yes sir.

Q. What did you do with those samples?

A. Those were sent to Dr. Whipple.

Q. Dr. Whipple of New York?

A. George Whipple, yes sir.

Q. How did you ship them?

A. Shipped them by express.

Q. You shipped them by express?

A. Yes sir.

Q. How were they prepared for that shipment?

A. Why they were crated.

908 Q. Explain how you did that?

A. Why, I had a box and I put six of these large bottles—I think it was six large bottles in a box; each bottle was sealed and we also sealed and stamped the cover of the box.

Q. Did you use any ice in that?

A. No sir, no ice used in that.

Q. Do you know what was the condition of the temperature, of the atmosphere at that time?

A. Why it was about the same as it is now.

Q. The report won't tell what that is?

A. It was pretty cold.

ATTORNEY GENERAL CROW: Well, it wasn't freezing?

A. No, I don't think it was freezing.

JUDGE SPRINGER: What state was the thermometer?

A. I say, I don't know exactly what the temperature was. You know I can't remember that now.

Q. The thermometer is the only thing that would indicate the temperature in the record?

A. Well that was all put on the tag.

Q. That was all put on the tag?

A. Yes sir, that was all put on the tag.

Q. What was it you put on each tag?

A. Well, we put the name of the river that it was taken from, the temperature of the water and the location—

909 ATTORNEY GENERAL CROW: And the time?

A. Yes sir, the time of the day it was taken; temperature of the water and the temperature of the air; both were taken.

Q. JUDGE SPRINGER: That all appears on the tag?

A. Yes sir, that is all on the tag.

Q. I believe you stated that you knew that Dr. Whipple got these samples. How did you know that?

A. I was told afterwards that he got them.

Q. You were told by whom?

A. By my brother.

ATTORNEY GENERAL CROW: You needn't waste any time on that; we will put Dr. Whipple on the stand.

JUDGE SPRINGER: All right. I understood him to say before that he got a receipt for them.

ATTORNEY GENERAL CROW: From the express company.

THE WITNESS I got a receipt from the express.

Q. JUDGE SPRINGER: So you know nothing about their receipt in New York, except what you were told by others?

A. That is all, yes sir.

Q. Do you know how long it would take for those samples to go from the place at which they were shipped, to New York City?

A. No sir, I don't.

E. J. RAVOLD.

ADJOURNED until 9:30 A. M., Friday, February 27, at Southern Hotel, St. Louis.

910 Southern Hotel, St. Louis, Missouri. 9:30 a. m., Friday, February 27th, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

DR. W. C. G. KIRCHNER re-called for further direct examination by Attorney-General Crow, testified as follows:

Q. Now, doctor, turn to the work in 1899, and we will identify that in the first place. I believe you began on August 10th, 1899. The first was taken near the St. Louis Waterworks at the Chain of Rocks, August 10th, 1899. Now, did you collect samples at that place?

A. At the Chain of Rocks, 1899, yes, sir.

Q. Now, you had a temporary laboratory there?

A. Yes, sir.

Q. And you made a bacteriological examination?

A. Yes, sir.

Q. And did you make any data at the time of the results?

A. Yes, sir.

Q. Have you got those?

A. Yes, sir.

911 Q. Now, what period of time does it cover and what points with reference to the Intake? Some at the Intake and some at the Uptake?

A. I have here some data with reference to the Uptake. The first record was made here August 10th, 1899.

Q. When was the last one?

A. And they continued August the 10th and 11th, and through August to September 11th.

Q. They run along further than that, along to the 25th?

A. I have some records here also as to September 20th. Of course, those were afterwards collected. In these details it is a little more difficult for me to give them just straight in that way.

Q. What details do you refer to?

A. These details I submitted to Dr. Ravold.

Q. Well, here are the details (handing paper to witness). That was made from your data there. Now, that runs to September the 25th.

JUDGE SPRINGER: The record won't show what you handed to him.

ATTORNEY-GENERAL CROW: It is the quantitative determination of bacteria in samples of water collected at different points near the Intake of the St. Louis Waterworks, located at the Chain of Rocks. The bacteria per cubic centimeter.

912 Q. Now, that is the first detail. Haven't you got the data there?

A. Yes, but I was giving you the results of the Uptake, which are recorded up to the 11th, which was what I said—

Q. Now, that's all?

A. Now, some of the other records here at the Intake were collected in a special report. I have a note here, September 25th, 3,610. This may have been taken from one of those harbor boat trips.

Q. I know, but what I want you to do, doctor, is to say whether you have got the data from which this detail was made. That's all we want. We want to put that into the record. We don't want to go all through those figures.

A. I have it here. This detail has been arranged differently from the one I have made out. This is Dr. Ravold's arrangement, probably.

Q. It is more compact?

A. It is more compact, yes.

ATTORNEY-GENERAL CROW: I don't think it is necessary, gentlemen, to identify those. If he will examine those and state that the figures there correspond with the notes that were made at the time, and that the statement is correct.

A. I didn't compile this detail.

Q. You have got this data and know as to whether they correspond?

913 A. September 25th, 3,600. I cannot state whether on that date at the Uptake they were. I have collected it in different details. This is one of the harbor boat trips and came in a special list, but this list here from the Uptake, I will read and it will correspond exactly.

Q. I don't want you to read that. That's what I want to avoid.

JUDGE SPRINGER: Let him state whether he examined these figures and whether they correspond with the notes he made at the time in his own detail.

ATTORNEY-GENERAL CROW: I know what I want to get at. Now, this detail here that has been described as the determination of bacteria in the samples of water at the different points near the Intake, commenced August 10th, 1899, and ended September 25th, 1899, is that correctly made and based upon the data that you made as a bacteriologist in the examination of that water at that time?

A. It is.

Q. And you took that water from the river?

A. Yes, sir.

ATTORNEY-GENERAL CROW: I think that will cover that.

Q. Now, have you got the data you made on the harbor boat trip commencing September 6th and ending September 25th? There is the detail I hand you now, you can examine it and see.

914 A. The details presented here of the harbor boat trips of September 6th, 9th, 16th, 21st and 25th, correspond with the data I collected, referring to these respective dates.

Q. And you have that data there?

A. I have that data, the original.

Q. And this detail is correctly made from that?

A. Yes sir.

Q. Now in carrying out the results in this detail, do the exact number of bacteria correspond with the number you had, or was there any change made in the numbers, and if so, explain why, their exact number does not correspond.

A. Because in accordance with the general rules of the Bacteriological Association or the American Public Health Association a certain arrangement has been made as to the recording of results. It is something like this: The method of recording results of bacteria: One to fifty recorded to the nearest unit; fifty-one to one hundred to the nearest five; 101 to 250 to the nearest ten; 251 to 500 to the nearest twenty-five; 501 to 1000 to the nearest fifty; 1001 and over to the nearest 100.

Q. Explain what you mean by that. By changes with reference to that.

A. So that in my original details for instance, if a number would read 159, it would be recorded to the nearest
915 number with reference to this detail, which would be 150.

Q. The nearest even unit?

A. Yes sir.

Q. Now you worked on this matter under Dr. Ravold in 1900?

A. Yes sir.

Q. Now this begun January 23rd, and ran to October 11th, 1900. The first work seems to have been done in the Illinois River, three miles above and below. Now have you got the data that you made at the time you did that work?

A. Yes sir.

Q. Now where were you located when you did that work?

A. The St. Louis Medical college, the medical department of Washington University.

Q. What time did you commence that work?

A. The work was started January 23rd, 1900.

A. Did anybody assist you in that work?

A. In this work I was assisted by Dr. Rush.

Q. Did Dr. Rush analyze bacteriologically the same samples that you did?

A. The same samples that were examined by me.

Q. Now explain the method that you worked under.

A. These samples were examined in duplicate, and Dr. Rush and myself examined each of these samples so that in this way the work was divided, and in general, duplicates were made of all samples; that is to say, by two different persons.

916 Q. Explain your method of procedure, what you mean

by your work there; what did you do? You plated them and counted them, didn't you?

A. The general work consisted in plating and counting the bacteria.

Q. Now how did you ascertain the results after you had counted them. Did you always get the same?

A. The results were averaged.

Q. Well, how. Explain how you averaged them?

A. Each would refer to his own analysis, to his own results. The figures obtained from the similar samples were averaged.

Q. Is that in accordance with the proper way to do that bacteriologically where two men work on the same samples?

A. It is the safer way, it is a check. One individual checks the work of the other by this method.

Q. Well, is that the way, scientifically, this class of examinations are made bacteriologically, of water where two men work on the same samples?

A. Yes sir.

Q. Now have you got the results or data there?

A. Yes sir.

Q. What was the first examination you made, beginning September 23rd?

A. No, January 23rd.

Q. At what point?

917 A. Various samples were taken at that time: from Peoria, Grafton, Elsah, at Chain of Rocks, Illinois shore, Intake, Uptake and Reservoir.

JUDGE SPRINGER: What do you mean by uptake?

A. The uptake is the well which is situated on the shore at the Chain of Rocks and is connected with the Intake by a tunnel.

ATTORNEY GENERAL CROW: At what point did you begin?

A. These various samples were submitted on this day.

Q. At what point in the river did you begin three miles above Poria?

A. On January 23rd at Peoria, I counted 22,880.

Q. Hold on a minute. I don't want you to read those figures. That's what I am trying to avoid. Wait until I get this detail here. We want to save time on this if we can.

A. I have also Grafton records. What do you want, three miles above Peoria, beginning on the 23rd of January?

Q. Now you take that examination and see if your data there corresponds with that detail.

THE WITNESS: Did you read that detail, Dr. Ravold?

Q. What detail is it?

DR. RAVOLD: This is the results of quantitative determination of Illinois River three miles above Peoria, beginning the 23rd of January and ending October 11th.

918 THE WITNESS: This detail corresponds with my results.

Q. Now you made those examinations?

A. Yes sir.

Q. Where did you get the water from?

A. The water was sent to the laboratory by collectors.

Q. Do you know who collected it?

A. I do not.

Q. Now who was it sent to, to Dr. Teichmann or to whom?

A. They were sent to the Medical College.

Q. Now the next point there is three miles above Grafton, see if you have got the data from which this detail was made. This detail is the quantitative determination of bacteria in the Illinois River three miles above Grafton, together with results of tests for the coli communis from January 23rd to October 11th, 1900.

A. This detail corresponds with the results I have collected.

Q. Now the next one is the Mississippi River two miles above Grafton. The results of determination of bacteria in the Mississippi river water two miles above Grafton, from January 23rd, to October 11th, 1900. Now I will ask you if you have got the data from which that examination, or that detail was made, and if you made a bacteriological analysis of the water?

A. I did.

919 Q. Now the next one is the Mississippi River above Alton, Illinois, the same period. The quantitative results of the tests for bacteria on the same dates.

A. I did.

Q. Did you make an analysis of the waters?

A. Yes sir.

Q. Now have you got the data from which this detail was made?

A. I have.

Q. Were the details correctly made?

A. Yes sir.

Q. Did you make the data at the time?

A. The data was made at the time.

Q. The next is, the Mississippi River opposite Hartford, Illinois, same period, January 23rd to October 11th, an examination of the Mississippi River water for the determination of the number of bacteria per cubic centimeter between January 23rd and October 11th, 1900. Please examine that and see if you have the data from which that was made and as to whether or not you made an analysis of the water at that time?

A. I have this data, and made an analysis of the water.

Q. And is this detail that I have referred to correctly made?

A. Yes sir.

920 Q. The next is the Missouri River opposite Ft. Bellefontaine, on the Missouri shore, being results of the quantitative determination of bacteria in the Missouri River, between January 23rd and October 11th. Please examine that detail and see if you have got the data from which that bacteriological detail was made, and state whether or not you made an examination of the water?

A. The detail corresponds to my original data, and I also made the examination of the waters from which the data were obtained.

Q. Is the detail correctly made?

A. Yes sir.

Q. The next is the Mississippi River at Chain of Rocks, near the Illinois shore, being result of the determination and examination of the water for bacteria at the point above named, between January 23rd and October 11th, 1900. I will ask you to please state if you made an examination of that water at that time, and if you have the bacteriological result or data which you made at the time, of the examination, and whether or not that detail is correctly made from that data?

A. I made the examination and the detail corresponds with the original results, and it is correct.

Q. Did you make a memorandum of the data at the time you made the examination?

921 A. Yes sir.

Q. Now the next is the Mississippi River, Chain of Rocks, near the Missouri shore, being the results of the quantitative determination of bacteria in the Mississippi River water near the Missouri shore at the Chain of Rocks, between January 23rd, and October 11th. I will ask you to examine that detail.

A. This is the Intake. I have here the detail of the Intake which corresponds to the original data collected and is correct.

Q. You made the examination of the water at that time?

A. I did.

Q. Now you see you have got the details mixed here. Here is the one I asked you about before, and I asked you about this one at the Chain of Rocks, and the other at the Missouri shore. Here is the one at the Chain of Rocks, near the Illinois shore. You have got these details mixed.

A. I was comparing them with the results down here (indicating paper).

Q. You see this is the Intake of the St. Louis waterworks at the chain of rocks (indicating).

A. Yes sir.

922 Q. Now here is the one at the Chain of Rocks near the Illinois shore. Now you see you had that above there. Now you turn back in your data. You have got your data mixed up. Turn back there and see.

A. I have it right here.

Q. Does that correspond?

A. Yes, that corresponds.

Q. Well you have put that detail in?

A. Yes sir.

Q. Now the next detail is at the Chain of Rocks near the Missouri Shore, have you got that?

A. Yes sir.

Q. Now I will show you the detail, being the result of the quantitative determination of bacteria in the Mississippi River water at the Intake of the St. Louis Waterworks, at the Chain of Rocks, made between the 23rd of January, 1900, and the 11th of October, and will ask you if you made the examination of the water and if you have the original data of the bacteriological result of that examination, and if so please compare it with the detail I presented to you and state whether or not this detail is correctly made?

A. I have compared the detail with the original results, and made the examination of the water and find the detail to be correct.

923 Q. Now the next is the reservoir at the Chain of Rocks. I show you the detail, being the quantitative determination of bacteria in the water collected from the reservoir of the St. Louis waterworks at the Chain of Rocks between January 23rd, and October 11th, 1900, and ask you if you made that examination bacteriologically, and if you have the data which you made at the time, and if so please compare it with the detail I present you and state whether or not it is correctly made?

A. I have compared the detail with the original data and find that the detail is correct, and that I also made the examination from which the detail was made, the bacteriological examination.

Q. Now that is the end of that period, isn't it?

A. Yes sir.

Q. Now I show you a detail, being the result of examination for bacteria in the discharge of the Chicago Drainage Canal before it passes over the Bear Trap Dam at Lockport, Illinois, made between the 3rd day of March, and October 11th, 1900, and ask you if you made these bacteriological examinations, and if so where you made them, and where you received the water from and whether or not the detail which I have shown you, was correctly made from the data obtained at the
924 time?

A. I have the original data from which the detail was made, covering the period stated from March 3rd to October 11th, and find that the detail is correct and that the water was sent to the laboratory having been collected by collectors; that the examination was conducted at the medical college of the medical department of the Washington University and also at the Old City Hall in the City of St. Louis.

Q. In what year was this?

A. In 1900.

Q. Now I show you the detail being the result of the quantitative determination of the water in the Des Plaines River at McDonnough Street, Joliet, Illinois, made between March 3rd and October 11th, 1900, and ask you if you made that bacteriological examination, where you received the water from, whether or not you made any data at the time and if so examine the same and see if this detail I present you is correctly made from that data?

A. I made data on the bacteriological investigation of the water from the Des Plaines River at Joliet collected near McDonnough Street; that data corresponds with the detail and I find it to be correct.

Q. I show you now the detail, being the determination of the examination of water for bacteria collected at the
925 different cribs in Lake Michigan, with the results of the
tests for the bacillus coli communis between July 23rd and November 9th, 1900, and ask you if you made that bacteriological examination and where you received the water from and if you made any data at the time of the examination, and if so, if the detail I show you is correctly made from the data which you have?

A. The samples of water were sent to the laboratory, having been collected by collectors for that purpose; the results were recorded at the time and compared with the detail and the detail is found to be correct, except that the coli record as given here was not made by myself.

Q. State where. "Here" don't mean anything in the record.

A. It is stated here in the record, "result of tests for bacillus, cold communis"—I didn't make such test: I simply made the quantitative determination.

Q. I show you a detail, being the quantitative determination of bacteria in samples of water collected from the reservoir of the St. Louis Waterworks, Chain of Rocks, between

January 23rd, and October 11th, 1900, and ask you if you made an analysis of this water and if you made any data on the bacteriological results, and if the detail I show you was correctly made from the data made by you at the time of that examination of the water?

A. The detail was correctly made from data collected at the time; the samples were collected, and such samples
926 were submitted to me having been sent by the collectors.

Q. Now I show you a detail showing the determination of bacteria in samples of water collected at the tap in the bacteriological laboratory in the Old City Hall, City of St. Louis, Missouri, between the 11th day of May and October 31st, 1900, and ask you if you made the bacteriological tests of this water and if you have the data, made by you as the results of such tests at the time, and whether or not the detail I show you is correctly made from that data?

A. I made the bacteriological examinations of the tap water and recorded the results, and have compared them with the detail submitted here and find that detail is correct.

Q. I show you now a detail showing the quantitative examination of the water of the Des Plaines River made between October 5th and November 25th, 1901—at what point was this?

A. About a mile above the point where the Des Plaines River flows into the Drainage Canal or meets the Drainage Canal.

Q. (Continued) —about a mile above the confluence of the drainage canal and the Des Plaines River and I will ask you if you made an examination of that water at that time, and if you made any data, and if this detail is correctly made from that data?

A. I made an examination of the water of the Des Plaines River as indicated in the detail, recorded the results at
927 the time, and find that these results correspond with those in the detail.

Q. I will get you to examine this detail showing the bacteriological examination above the Bear Trap Dam on September 26th, 1901, and continuing until November 25th, 1901 and see if that detail is made correctly from the data you have, and if you made that examination?

A. I find that the detail as presented here, corresponds with the results which were obtained by the bacteriological examination of the water taken from the Bear Trap Dam, above the Bear Trap Dam at Lockport.

Q. I show you now the detail purporting to be the bacteriological examination of the waters of the Drainage Canal at the 9th Street Bridge, Lockport, and ask you if you made the examination and if you have the data made at the time and if the detail here presented is correct, extending from October 2nd, 1901 to November 25th, 1901.

A. Yes sir. I find that this detail as presented corresponds with the results of the examination bacteriologically of the water taken from the Drainage Canal at Lockport at the Ninth Street bridge.

Q. I show you now the detail disclosing the bacteriological examination made at the Illinois & Michigan Canal, 9th Street
Bridge, Lockport, Illinois, between September 26th and
928 October 30th, 1901, and ask you if you made that bacteriological examination and if this detail is correctly made from the data gathered by you as the result of that examination.

A. I find that this detail corresponds with the original data obtained by the examination of the water of the Illinois & Michigan Canal at Lockport, at the 9th Street bridge.

Q. Now I show you a detail representing an examination bacteriologically of the water of the Drainage Canal below Rubey Street, Joliet, Illinois, between September 25th, and November 25th, 1901, and ask you to state if you made an examination and if this detail is correctly made from the data gathered by you as a result of that examination?

A. I find that the detail corresponds with the results obtained by making the bacteriological examination of the drainage canal below the Rubey Street bridge at Joliet.

Q. I show you now a detail made of the bacteriological examination of the Drainage Canal above Brandon's Bridge, Joliet, between September 27th, 1901, and November 25th, 1901, and ask you if you made that examination and if you have the data gathered as a result of that examination, and if the detail presented to you is correct as made from that data?

A. I made the bacteriological examination of the Drain-

age Canal at Brandon's Bridge, above Joliet, and recorded the results at the time, and find that these results correspond
929 with the detail presented.

Q. Now you stated that you made all these examinations in pursuance of the ordinary and proper method of bacteriologists in the examination of this water?

A. Yes sir.

Q. Made under the supervision of Dr. Ravold, was it?

A. Yes sir.

Q. Did you have any instructions as to the manner in which these were to be made?

A. Instructions as to the general routine work were given, and these were based mainly upon the procedures for bacteriological work recommended in the American Public Health Association's report.

CROSS EXAMINATION,

By Judge Springer.

Q. Doctor, you stated yesterday, the course which you pursued at Joliet in reference to making bacteriological examinations of the water taken at that place—State whether the examinations to which you have testified today, were made under the same circumstances and conditions?

A. Are you referring to my statement of yesterday, Judge?

Q. Yes.

A. In general, all the examinations as reported this morning are in accord with the methods I indicated in yesterday's testimony.

930 Q. You pursued substantially the same methods in making your examinations of the samples to which you have referred today, that you pursued at Joliet?

A. Yes sir.

Q. Do you know where the samples came from to which you have testified today, any further than they were reported to you by those that had taken them?

A. With the exception of those samples received at the Joliet laboratory I have no other information than that which was indicated on the label attached to the sample.

Q. Do you know the names of the persons who took these samples?

A. Yes sir.

Q. Were they upon the labels accompanying these bottles?

A. Yes sir.

Q. And what other data, if any, were upon that label?

A. There was the date, location, temperature of the air and water, the name of the collector, and the weather indications, and often such other information as would be collected by the collector.

Q. Your examinations of the water to which you have referred today, began at what date?

931 A. They began—I can refer to them exactly. On those details which I reported today, the examination began August 8th, 1899.

Q. And ended when?

A. And ended October 31st, 1900. I should say there was an intermission in my work which I have not stated.

Q. Have you testified today in reference to any examinations made in 1891?

A. Then there was a period of examination in 1901 which began September 25th, and ended November 25th, 1901.

Q. Where were the examinations made of the water taken in 1899?

A. Those examinations were made in the laboratory at the Chain of Rocks.

A. At what place were those samples taken?

A. They were taken at the Intake or Uptake, the so-called Uptake and at various points in the river at the Chain of Rocks, on the Illinois side and on the Missouri side.

Q. How long after the samples were taken was it, until you plated them in your laboratory?

A. Are you referring now to this first period?

Q. I am referring to the time of which we are now speaking.

A. The samples were plated immediately upon arriving at the laboratory, and usually from five to fifteen minutes 932 elapsed between the time they were collected and plated at the laboratory.

Q. That refers to those that were plated at the laboratory at the Intake?

A. Yes sir.

Q. In 1899?

A. Yes sir. In addition there were also some samples taken on the boat in this period. Those samples were plated on the boat directly after collection.

Q. Now that covered all the samples in 1899, did it?

A. Yes sir.

Q. Now where were the samples taken in 1900 plated?

A. Those samples were plated first at the medical department of Washington University,—in the laboratory of the medical department of Washington University, and later in the old City Hall at St. Louis.

Q. At what place were those samples taken for that year?

A. They were taken at the Bear Trap Dam at Lockport, and the Des Plaines River at McDonnough Street, Joliet; the Illinois River three miles above Peoria; the Illinois River three miles above Grafton; the Mississippi River two miles above Grafton, Illinois. The Mississippi River one mile above Alton; the Mississippi River opposite Hartford, Illinois; the Missouri River opposite Ft. Bellefontaine, Missouri; the Mississippi 933 river at the Chain of Rocks near the Illinois shore; the Mississippi river at the Chain of Rocks near the Missouri shore; the Mississippi River at the Chain of Rocks, Intake tower, and the reservoir at the Chain of Rocks.

Q. Now were all those examinations made in the city of St. Louis?

A. I should include in that the tap of the bacteriological laboratory.

Q. Yes.

A. All those examinations were made in the city of St. Louis.

Q. How long after the sample was taken from Bear Trap Dam was it until it was plated in St. Louis?

A. The samples were usually plated on the next day. Of course for each particular sample I had a particular record.

Q. I am not asking you for that.

A. In general?

Q. Yes, I am speaking generally?

A. Usually on the next day, as soon as they arrived at the laboratory, having been sent from the station.

Q. How were they sent from the station?

A. They were sent by express.

Q. Can you state how they were packed?

A. They usually came cold; they were cold when they were received.

934 ATTORNEY GENERAL CROW: Explain what you mean by cold.

A. They had been transported in ice:

JUDGE SPRINGER: About how many hours then elapsed between the taking of the samples in the Drainage Canal at Joliet and Peoria, before those samples were plated in your laboratory in St. Louis?

A. From 24 to 48 hours. I can refer to it definitely.

Q. Well, you may state one of them definitely from each place, if you please?

A. On May 14th, the sample was collected at 9:00 A. M., at Lockport above the Bear Trap Dam and was plated May 15th, at 4:00 P. M.

Q. Now take one from Joliet.

A. I will take a different date. May 20th a sample was collected at 11:00 A. M. and plated May 21st at 3:00 P. M.

Q. Now take one at Peoria?

A. Peoria, May 18th, collected 8:40 A. M.; plated May 19th, 4:00 P. M.

Q. That was how many days elapsed then?

A. That was, well, just about a day, between the 18th and 19th.

Q. A little over 24 hours?

A. Yes sir.

Q. Will those three samples compare as to time fa-
935 forably with the others or unfavorably?

A. I think they compare favorably with the length of time, except that when the results were very bad the record wasn't placed in the official record.

Q. Did you take any samples at Beardstown, Illinois?

A. No sir.

Q. And none at Pekin Bridge?

A. The only record I have is that which was attached to the label, and that wasn't one of our regular collecting points.

Q. You didn't receive any samples then that came from the Pekin Bridge below Peoria, or from Beardstown?

A. Not regularly.

Q. Are any of the examinations to which you have referred in the detail presented by Dr. Ravold from those two places, that you examined also?

A. No.

Q. The next place then would be the mouth of the Illinois River at Grafton. What time elapsed between the time of the taking of those samples and the time they were examined in St. Louis?

A. On the 21st of May, for instance, a sample was collected in the Illinois River at 6:00 A. M. and was plated on the same day at 3:00 P. M.

936 Q. That is nine hours?

A. Yes sir.

Q. Is that a fair statement as to the others, as to the time elapsing between the taking of the other samples and their examination?

A. It compares favorably with those. Sometimes the time was a little shorter I think, and sometimes a little longer, but it compared favorably with the time.

Q. Now the other examinations to which you refer were at Alton, at Hartford and near the Chain of Rocks. Did you also make an examination of water taken at Ft. Bellefontaine, Missouri River?

A. Yes sir.

Q. State how long a time elapsed between the taking of the samples at that place and the plating in your laboratory?

A. I have here a record. On May 19th, a sample was collected at Ft. Bellefontaine, Missouri at 10:40 A. M., and was plated on the same day at 4:00 P. M.

Q. Six hours?

A. Yes sir, and this compares favorably with the time required in the other examinations.

Q. The samples taken near the Intake I presume, were

plated much sooner, according to your statement made heretofore, is that right? The samples taken at the Chain of
937 Rocks I mean, along that line, were plated sooner?

A. Some of those were plated sooner, yes. They were plated sometimes within a few hours. When we were at the laboratory at the point of collection, I will say, immediately after collection.

Q. You were going to make a further statement.

A. No, not unless you ask.

Q. Have you any statement as to the time which elapsed between the taking of the samples at Hartford, Illinois, and the time of their examination in the laboratory?

A. Yes sir.

Q. What is that?

A. I have here for instance, a record on the 17th of May where a Hartford sample was collected at 9:45 A. M. and was plated the same day at 4:00 P. M. I have also another record of a sample collected on May 20th at noon and this sample was plated on the next day.

Q. What time?

A. At three P. M. but usually samples were plated on the same day within a few hours after collection.

Q. Can you put in the record that sample that was plated the next day after it was taken. Have you identified it?

A. It could be identified by the serial number. It sometimes happened that on Sunday or on special occasions
938 when the train was late, it was impossible to plate the sample on the same day.

Q. Can you state the conditions in which the samples were at the time you made an examination of them as far as the temperature is concerned?

A. All samples which were plated were cold.

Q. What do you mean by cold. Give me the temperature according to the Centigrade or Fahrenheit, whichever you care to. There are so many different terms.

A. When the sample was not cold, it was not used, or a special record was made.

Q. Well, what do you mean by cold in temperature?

A. Now the samples when received were packed in ice.

Q. When you received them?

A. Yes sir.

Q. What was the temperature which you noted, if any, according to the thermometer?

A. Well, it varied; I do not remember the exact temperature.

Q. Did you note the temperature?

A. It has been done.

Q. That was part of the examination, to note the temperature at the time of the examination.

A. Well I didn't make a routine practice of taking the temperature of the water of the samples. 939

Q. Did Dr. Ravold make those entries?

A. I don't know.

Q. Isn't it important to make a record of the temperature of water when you make an examination of a sample of it?

A. It is in certain respects.

Q. Will there not be a greater number of bacteria in the water at what we call body temperature, than if it is down towards the freezing point?

A. Yes, but I said that all these samples were packed in ice and that the samples were taken from the receptacle containing ice.

Q. That completes your examination for the year, 1900?

A. Yes sir.

Q. Did you go beyond that?

A. Yes sir, 1901.

Q. Now state when you made the examinations in 1901, or rather, where you made them?

A. The examinations in 1901?

Q. I mean state where the samples were obtained for the examinations which you made in 1901?

A. The examinations in 1901 were made at the laboratory situated in Joliet, Illinois.

940

RE-DIRECT EXAMINATION.

By Attorney General Crow.

Q. These samples came packed in ice, in an ordinary bottle?

A. Well, the samples were properly sealed.

Q. I know, but the bottle was packed in ice?

A. Yes sir.

Q. I will get you to state if it would have been possible to have obtained the temperature of that water without spoiling the sample?

A. Well, it would have been impossible to get the temperature of the water directly without spoiling the sample for bacteriological purposes.

Q. Now, was a record made of the temperature of the air and water at the time the sample was taken out of the water?

A. Yes sir.

Q. Where is that record?

A. That record was placed on the label and was also referred to in some of the detail.

Q. Well it should be on each one of the labels on the bottle?

A. Yes sir.

Q. Do you know who put that label on there?

A. The label was put on by the collector who signs his name to the label.

941 Q. Now you made a record of the temperature of the air and water at the time it was taken and placed in these books about which you have been examined there?

A. Such a record has been made.

Q. Is it in these books, the memorandum which you had?

A. Yes, sir.

ATTORNEY-GENERAL CROW: Now, I offer counsel on the other side an examination of that part of the record any time they wish to. I don't care to put it into the record; it is too much and is not necessary.

RE-CROSS-EXAMINATION, by Judge Springer.

Q. Now, what proportion of the sample that you received was used by you in making the examination?

A. The portion selected directly for the examination depended upon the number of bacteria which experience showed us that particular sample would probably contain. For instance, it was necessary in some cases, to dilute one cubic centimeter for the purpose of obtaining a satisfactory count of the bacterial numbers.

Q. You never used more than one cubic centimeter of the sample for one examination, is that right?

A. Uniformly, one cubic centimeter was taken for a particular plate. 942

Q. Then, couldn't you have inserted a thermometer into the rest of it and obtained the temperature at the same moment? That water was thrown away after it was taken?

A. In some cases these samples were reserved for qualitative determination. We didn't care often to destroy the sample. This is the way samples were kept for more than twenty-four hours, often, for the purpose of determining as the case may be, some qualitative determination.

Q. Well, were they kept in ice during these 24 hours?

A. They were kept in the ice box.

Q. Under the same conditions of temperature that you found them in the first place?

A. Well, yes, under the same conditions of temperature.

WALTER C. G. KIRCHNER.

943 DR. AMAND NICHOLAS RAVOLD, resumed the stand for further direct examination by Attorney-General Crow and testified as follows:

Q. Now, Dr. Ravold, these examinations that Dr. Kirchner testified to were made under your supervision?

A. Yes, sir.

Q. Now, you heard and saw the comparisons made from the data he had and those I presented to him, and I will ask you if the details I presented to him, are the same details for the corresponding period that you have heretofore read into the record in this case. Examine them and see.

A. Yes, sir, they are. I read over all these details.

Q. These details were read into the record?

A. Yes, sir, by me.

Q. Those are the details that Dr. Kirchner has identified as having been made from the data collected at the time stated by Dr. Kirchner?

A. Yes sir.

944 **JAMES J. MOORE**, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Mr. Jeffries, and testified as follows:

Q. What is your name?

A. James A. Moore.

Q. Where do you live, Mr. Moore?

A. I live at 1415 North Ninth street, St. Louis.

Q. How long have you lived in St. Louis?

A. I have lived here all my life, 28 years.

Q. State whether or not you ever did any work for the Health Department of St. Louis?

A. Yes, sir.

Q. Any work in connection with collecting samples from the Missouri river for Dr. Teichmann and Dr. Ravold, and if so, when?

A. From October 4th, 1901, until December 1st, 1901.

Q. At what point did you make those collections?

A. At Ft. Bellefontaine on the Missouri river.

Q. You commenced, then, on the 4th of October, 1901?

A. The fourth of October, yes, sir.

Q. Under whose direction did you work?

A. Well, I worked under Dr. Teichmann's direction.

Q. Who was Dr. Teichmann?

945 A. He was city chemist.

Q. Of the City of St. Louis?

A. Yes, sir.

Q. What time of day did you make those collections?

A. I left the office about 8:20.

Q. What office?

A. The city chemist's office, and took a Burlington train up to Bellefontaine and arrived there at 9:20, and returned with the sample about twelve o'clock, between eleven and twelve o'clock.

Q. Now, what part of the river did you take the samples from?

A. Well, the samples were taken from the north side of the river in the middle of the channel.

Q. Does the channel run to the north side of the river?

A. On the north side of the river, yes.

Q. What did you take them with?

A. They had an apparatus there that they fitted the bottle in. This is one of them here (indicating.) And they were supposed to be taken as near three feet as possible below the surface or top of the water.

Q. You say this is one of the instruments?

A. Yes, one like that.

946 Q. You used an instrument like this in collecting the samples?

A. Yes, sir, for the large bottles and the small ones.

Q. Now, can you describe that?

A. Describe it in what way?

Q. Well, how it works?

A. Well, the bottle is fitted in here, into this business here, into this apparatus at the bottom of it. This part would come out here.

ATTORNEY-GENERAL CROW: You let Dr. Ravold describe that and the record will show it.

MR. JEFFRIES: Now, this is the character of instrument you used in the collection of these samples?

A. Yes, sir.

Q. You used an instrument modeled like this?

A. Yes, sir.

Q. In every particular?

A. No, sir, for the large bottles we had a larger machine.

Q. I have reference to the small bottles?

A. Yes, sir.

Q. Now, when you collected the larger samples you used a larger instrument?

Q. Patterned on the same order?

A. On the same order, yes, sir.

947 MR. JEFFRIES: Now, we offer this instrument in evidence to be known as complainant's Exhibit 15.

So marked by the Commissioner.

Q. Now, how deep under the surface of the water did you select the samples, or collect the samples?

A. About three feet. I should judge it would be three feet.

Q. The full length of the instrument, of the handle of the instrument?

A. Yes, sir.

Q. How large were the small bottles?

A. Do you mean the exact size?

Q. About how large?

A. I don't know exactly. That is one of them there (indicating bottle in Exhibit 15). About that size. I don't know how much that would hold.

Q. How large are the larger bottles, about how much would they hold?

A. I don't know exactly.

Q. Now, how often did you collect these samples?

A. Every morning.

Q. Sunday included?

A. Yes, every day.

948 Q. Now, after you drew the instrument out of the water that contained the bottle with the water in it, what did you do with that bottle?

A. Well, for the small bottles we had this tinfoil there that was packed around the top of them and a cloth placed over them and tied and sealed with a tag.

Q. How did you seal it?

A. With sealing wax.

Q. Did you put anything with a stamp on the wax?

A. Yes, we had a seal.

Q. What kind of a tag did you put on it?

A. Well, we had a tag that gave the place where the sample was taken, Ft. Bellefontaine, the time it was taken, and the temperature of the air and the water and the date and the name of the collector.

Q. You always put your name on that tag, then?

A. Yes, sir.

Q. Now, then, as soon as these samples were collected, what did you do with them after you had put the tinfoil around them and wrapped them in a cloth and put a tag around them and sealed them?

A. Well, they were packed in tin cans containing ice, packed with ice, with the ice packed around them.

Q. Now, was the ice directly on the bottles?

A. Yes, packed all around the bottles.

949 Q. All around the bottle, on the top and underneath?

A. Yes, sir.

Q. Then what was done with them?

A. Well, they were taken on the train and then I brought them to the Union Station and then to the office of the city chemist.

Q. How long did it take you to get from Ft. Bellefontaine after you had packed them, until you got to the city chemist's office?

A. Probably an hour; I guess about that time.

Q. Now, what did you do with them after you got to the city chemist's office?

A. Well, they were delivered. The small bottles were delivered to Dr. Ravold's assistant and were placed in the ice box in his place, and the large bottles were delivered to a gentleman by the name of LeRue, I believe his name was. He received all the bottles from all the collectors that came in, that is the large bottles.

Q. What did he do with them if you know?

A. I don't know what he did with them.

Q. Now, you collected all these samples under instructions, did you?

A. Yes, sir.

950 Q. What kind of instructions did you have?

A. Well, we had instructions as to where to take the samples and how to take them and to bring them back.

Q. Where did you get those instructions?

A. I had typewritten instructions from Dr. Teichmann.

Q. Did you have any from Dr. Ravold?

A. Well, I think that the instructions I got from Dr. Teichmann covered that part of it.

Q. You followed those instructions, did you?

A. Yes, sir.

Q. Now, you say you collected these samples continuously from October 4th, 1901, to December 1st, 1901?

A. Yes, sir.

Q. And you put tags on each one?

A. Every one.

Q. And you wrapped them and sealed them and packed them in ice, every one?

A. Every one, yes, sir.

Q. And brought them down to the city chemist's office and turned them over to the parties there, did you?

A. Yes, sir.

Q. What did you say you did with the small bottles that went to Dr. Ravold?

A. The small bottle was placed in the ice box, in Dr. 951 Ravold's department. There was always someone there that saw it go in, either him or someone there, that would take it from me.

Q. Well, was it put directly on the ice, or on the chest?

A. There was a kind of rack. It was placed on the rack up against a cake of ice.

Q. Up against a cake of ice?

A. Yes, sir.

Q. You saw that done, if you didn't do it yourself?

A. Yes, sir, I saw it done or did it myself.

JUDGE SPRINGER: I don't want to ask any questions.

JAMES J. MOORE.

952 FRANK J. BROWN, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT-EXAMINATION, by Mr. Jeffries.

Q. What is your name?

A. Frank J. Brown.

Q. Where do you live?

A. 2754 Lawton avenue, St. Louis.

Q. How long have you lived in St. Louis?

A. About twenty years.

Q. Were you living in St. Louis between January and May, 1900?

A. My home was in St. Louis; I was out of town at that time, at Peoria, Illinois.

Q. What were you doing there?

A. Collecting water samples for Dr. Teichmann, city chemist of the City of St. Louis.

Q. Where were you making those collections?

A. At a point about three miles north of Peoria in the Illinois river.

Q. When did you commence?

953 A. On the 23rd day of January, 1900, and continued them until May the 8th, 1900.

Q. From the 23rd of January to the 8th of May, 1900?

A. Yes, sir.

Q. Who employed you to do this work?

A. Well, I was working in the water department; I was under the personal supervision of Dr. Teichmann.

Q. You were working for the water department of the City of St. Louis?

A. Yes, sir.

Q. What time of day did you make those collections?

A. About 9:00 a. m.

Q. How did you make those collections?

A. I had a wire cage that I used until I got the model that has been shown here this morning—something similar to it. A large cage, and I collected this water about three feet as near as I could get at it, from the surface of the water.

Q. That is, you had a large cage until you got the model?

A. No, I never had a cage like that, but I had a large cage similar to that, that was shipped to me after I had been there about a month. The first thirty days I took this water from a cage that I borrowed from the water works. It was a wire cage, with lead at the bottom; it sunk very rapidly and took the water from the surface about three feet, and later on, I had a

954 model like that, only larger.

Q. That is a model similar to this—complainant's Exhibit 15?

A. A model made to hold a bottle holding a gallon.

Q. Similar to complainant's Exhibit 15?

A. The same apparatus as that, same model.

Q. Now, how deep under the surface of the water were those samples taken?

A. About three feet, as near as possible.

Q. How many different kinds of samples did you take in reference to quantity?

A. I have taken four bottles, gallon size, and two bottles of about six or eight ounces, whatever that bottle is, that is the size.

Q. Now, state what you did with those samples after they were collected?

A. I collected them and first put tinfoil over them.

Q. That is over the sample, the small sample?

A. Over the larger ones, too, for a long time until I was instructed not to. About the time I was to quit, they told me not to do that. That was a mistake, I guess. I put a white cloth around it, tied it with string, sealed it up with sealing wax. I had a seal that said City Chemist, St. Louis, on it, 955 stamped across the face.

Q. What one do you refer to?

A. They had this method of testing, and they could look at the seal of the bottle and see.

Q. You say you packed them in ice?

A. Yes, sir.

Q. State how you packed them in ice?

A. Chipped ice, small particles, and put it all around the bottles, as near as I could.

Q. And put a tag on it?

A. Yes, sir.

Q. What did you put on the tag?

A. The point at which I collected samples, the hour and the temperature of the water and the temperature of the air, and I believe the condition of the weather, and the condition of the wind, I think, if I remember right.

Q. Did you put your name on it?

A. Yes, signed it.

Q. Now, after you had packed the bottles in ice, what did you do with them?

A. I took them to the Adams Express Company's office at Union Station, Peoria, and shipped them.

Q. State how you prepared them for shipment?

A. The first samples that were taken up for the first 956 month, they were in a tin box and I had little tags, or little stickers, I guess you call them. I wrote my signature across the face of them and put six of them on each one.

Q. What did you do that for?

A. So the box couldn't be opened without breaking the little stickers, so that they could tell when it arived at St. Louis, if it had been opened.

Q. Now, what particular place in the river were those samples collected?

A. I got them as near as possible in the middle of the channel.

Q. Of the Illinois river?

A. The Illinois river channel at Peoria. And the channel at Peoria is inclined to be a little bit to the west side, I believe, a little to the west side, just at that point.

Q. And three miles above Peoria?

A. Three miles above Peoria.

Q. Now, then, how soon after the collection of these samples was made until shipment was made?

A. Well, about three hours.

Q. How prepared?

A. You see, I had to go up the Illinois river to get these
samples and preparing them and packing them to ship,
957 that would take an hour and a half to two hours to make
the trip and get down. I would take them to the Union
Station.

Q. Did you collect those samples each day?

A. Every day, yes, sir.

Q. About seven o'clock in the morning?

A. Yes, sir.

Q. And you kept that up from January 20th to the 8th of May, 1900?

A. Yes, sir.

Q. You haven't any of those tags you put on, have you?

A. No, sir, I have not. I could very readily tell if I should see them.

MR. JEFFRIES: That's all for the present, Mr. Springer.

CROSS-EXAMINATION, by Judge Springer.

Q. How many samples did you say you took each day?

A. Four large bottles and two small ones, I think. That is, most of the time, when I collected first. They hadn't any necessary arrangement made to collect the full amount. I was sent out twice the first few days there.

Q. How deep below the surface did you collect the samples?

A. About three feet, as near as I could make it.

958 Q. At what part of the river with reference to its respective banks, did you take your samples?

A. Which way does the Illinois river run along there; does it run north and south? I don't know which way the Illinois river runs at Peoria.

Q. Straight north and south along there?

A. I think the channel at that point, to the best of my knowledge of the business, is a little bit inclined to be to the west shore, but it is very near the center at that point. It was very narrow there, and it is almost the center.

Q. You haven't answered the question yet. What part of the river with reference to its respective banks did you take the samples?

A. Nearest to the west.

Q. Did you take them all at the same place?

A. Yes, sir.

Q. All at the same place and taken at the same spot in the river?

A. Yes, sir.

Q. Was that done every day?

A. Every day, yes, sir.

Q. Why did you not take a line across the stream?

A. I wasn't instructed to do that.

959 Q. You followed instructions?

A. Yes, sir.

Q. I suppose you knew nothing about what became of those samples after they left the express office?

A. No, sir, I hadn't any idea.

RE-DIRECT-EXAMINATION, by Mr. Jeffries.

Q. Who did you say you expressed them to?

A. I addressed the tag to the city chemist, 1141 Market street, St. Louis.

Q. Where did you get these bottles in which you collected the samples?

A. I got them at the Adams Express Company's office at Peoria.

Q. Where did they come from?

A. The city chemist, St. Louis.

Q. Who do you mean by the city chemist?

A. Dr. Teichmann was the city chemist at that time, but I never used the words Dr. Teichmann on any of my samples. I addressed them to the city chemist, City of St. Louis.

Q. Giving the number of the office?

A. 1141 Market street, yes, sir.

960 RE-CROSS-EXAMINATION, by Judge Springer.

Q. Were these bottles when you received them, securely corked?

A. Yes, sir.

Q. Tightly?

A. Yes, sir.

Q. Air tight?

A. Air tight, yes, sir.

RE-DIRECT-EXAMINATION, by Mr. Jeffries.

Q. How were the small bottles wrapped when you received them?

A. The small bottles when I received them at the station in Peoria were wrapped in tissue paper.

Q. Each individual bottle?

A. All the small bottles, yes, sir.

(Subsequently recalled.)

961 EUGENE BRUNK, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT-EXAMINATION, by Mr. Jeffries.

Q. What is your name?

A. Eugene Brunk.

Q. Where do you live?

A. 2615 Whittier street.

Q. How long have you lived here in St. Louis?

A. About fifteen years.

Q. What business are you engaged in?

A. At the present time I am in the bricklaying business.

Q. What business were you in, in January, 1900?

A. Working as an inspector in the water department.

Q. In connection with the water department, state whether or not you were ever detailed to gather any samples of water on the Mississippi river?

A. I was. I was taking samples under the directions of Dr. Teichmann.

Q. When?

A. Starting about—I am not sure of the date, but I think it was January 23rd, 1900.

Q. Where did you collect those samples?

962 A. At the chain of rocks.

Q. How long a time?

A. I think it was five days that I took the samples, I am not certain about it.

Q. I will ask you to examine Complainant's Exhibit 15, and state whether or not that is a correct copy of the instrument which you used in the collection of the samples, a correct model?

A. That is a model of the instrument.

Q. You used an instrument like that?

A. Yes sir.

Q. State what particular part of the river these samples were collected from?

A. I took one sample out of the Missouri, close to the Missouri shore.

Q. How far from the shore?

A. Well on the Missouri shore side; I think it was three or four hundred feet, until we got out in the channel, and took one at the Intake tower and one from the Illinois side of the channel about 300 feet from the shore.

Q. You took samples then from the three places on the same day?

A. Yes sir, the same day.

963 Q. How often did you take them at the respective places?

A. The first day I took two samples at each place. After that I just took it once a day.

Q. How large were the samples of water you took?

A. These bottles that I took in the river were gallon bottles, I think that's what they were. I am not certain, but they were large bottles.

Q. They were the samples you took out of the river?

A. The larger bottles, and I also took two small bottles.

Q. Where did you take that from, the small bottle?

A. I am not certain but I think I took them at the Intake tower, a little above the Intake tower.

Q. In the Mississippi River?

A. In the river, I think; I am not certain about it any more; it is a long time and I made no record of it.

Q. Where did you obtain the bottles that you used in the collection of the samples?

A. The first bottles that I used, I got them out of the City Chemist's office and after that they were brought up by horse and wagon.

Q. They were handed to you by the City Chemist?

A. They were handed to me by one of the City Chemists.

Q. Now then as soon as you gathered the samples, what did you do with the bottles containing this water?

A. Well, the large bottles, they are corked up under the 964 water with the instrument that was used, and I took and wrapped a cloth around them, a piece of white duck I think it was, and then sealed them and put a tag on stating the temperature of the water and the temperature of the air, put my name on it and the time they were taken. The small bottles were wrapped with tinfoil and then sealed, and the same thing.

Q. Did you wrap a rag or anything around them?

A. I wrapped a rag and sealed them.

Q. What kind of a tag did you put on?

A. Just a pasteboard tag.

Q. What did you put on the tag?

A. My name and the temperature of the water and the temperature of the air and the weather outside.

Q. Did you state anything as to the time of its being collected?

A. Also the time.

Q. You put that on all the tags?

A. I tagged each bottle the same way.

Q. Now then, what did you do with these bottles, with the water in them after you had taken them, put the tinfoil around them and corked them up?

A. Well, the first two or thre days; I think it was the first three days, there was a wagon there, and I made that
965 drive and we took the bottles down and delivered part of them at the City Chemist's office and part of them to Dr. Kiser at Washington University, and the small bottles were taken to the St. Louis Medical College, to Dr. Ravold I believe, or his assistant.

Q. Now how soon after you had gathered the bottles before you wrapped them and put a tag on them?

A. Well, a period of fifteen minutes to half an hour; it would take that time.

Q. In other wards, just as soon as you could do it?

A. Just a soon as I could handle them.

Q. How long did it take you to take the bottles from that point at the Chain of Rocks, where they were taken, to the City Chemist's office here in the city of St. Louis and the different places where they were delivered?

A. About an hour and a half I think.

Q. State who you turned them over to at the City Chemist's office?

A. At the City Chemist's office I turned them over to Dr. Teichmann.

Q. Do you know what he did with them?

A. I do not.

Q. What did you do with those you took out to the St. Louis Medical college?

A. I turned them over to a doctor there, I don't know his
966 name.

Q. Under Dr. Ravold?

A. Under Dr. Ravold, I think, under his instructions.

Q. Now those that you turned them over to were there in a professional capacity?

A. One time Dr. Kiser and one time his assistant there at Washington University.

Q. First one and then the other?

A. Yes sir.

Q. Now were those small bottles prepared when you first got them, and where did you get them?

A. I got them at the City Chemist's office the same as the large bottles, and then after that they were sent out.

Q. What condition were those small bottles in; how were they wrapped, if they were wrapped?

A. They were wrapped in paper I believe.

Q. What kind of paper?

A. Tissue paper I believe. I am not certain of it any more.

Q. How deep under the surface of the water were those samples collected?

A. About two feet ten, or three feet.

Q. Now these various samples you said a few moments ago, were collected continuously from the time you commenced until you quit, each day?

A. They were continued from the time I started until I
967 quit.

Q. Did you take samples at any other place than what you took in this city in the river?

A. I did.

Q. Did you take any in the Intake tower?

A. Not in the Intake tower, but I took some of them in the Uptake tower.

Q. Where is the Uptake tower?

A. Right opposite the pumping house.

Q. What kind of samples did you take there, small bottles or large ones?

A. Large bottles I believe, but I am not certain about it.

Q. Now did you take any samples at the reservoir?

A. I took a sample at the reservoir, also.

Q. At the same time?

A. At the same time.

Q. What did you do with those?

A. I turned them over to the same place that I took the others, or turned the others.

Q. Did you take them in the same way you took the others?

A. I took them all the same way.

Q. In the same kind of bottles?

A. The same kind of bottles.

968 Q. What disposition did you make of them after you had gathered the samples?

A. I don't quite understand.

Q. State whether you wrapped them and put tinfoil around them and tagged them the same as you did the others?

A. I did, I used the same method with each bottle.

Q. And did you make the same disposition of them?

A. The same disposition.

Q. State whether or not the same time was employed in disposing of those samples that were collected in the reservoir as was employed in those that you collected in the river?

A. Well, those taken in the river were taken first and then I would take those in the resevoir and bring them all down together.

Q. But you prepared them and wrapped them just as soon as you took them out of the water?

A. Just as soon as I took them out of the water and got them in shape I wrapped them.

CROSS-EXAMINATION,

By Judge Springer.

Q. How long a period were you engaged, did you state?

A. About five days I think it was.

Q. What days were those? You haven't stated it I believe?

A. I think the first day I took them was the 23rd of
969 January.

Q. And five days after that consecutively?

A. Yes sir.

Q. Then you didn't take any samples subsequent to those five days?

A. No sir.

Q. You said you took some samples on the Illinois shore opposite the Intake, how far was that place from the Illinois shore?

A. Well, it was the Illinois side of the channel, I couldn't say accurately,—somewhere about three or four hundred feet.

Q. Three or four hundred feet from the shore?

A. Yes sir.

Q. What do you mean by saying on the Illinois side of the channel? In the channel of the Mississippi?

A. The channel of the Mississippi River, yes sir.

Q. Was it three hundred feet or 300 yards from Illinois shore?

A. Well I have no accurate way of measuring it, but just judging it, I should say 300 or 400 feet, may be further than that on water. I wouldn't be accurate about that.

Q. You didn't measure that distance?

970 A. No sir.

Q. Did you go over there at all, to the Illinois shore?

A. I didn't go to the shore.

Q. You didn't go to the shore; you simply went out in a boat to a point opposite the Intake towards the Illinois shore?

A. Yes sir, towards the Illinois shore.

Q. And you said you took the sample about 400 feet from the Illinois shore?

A. About that.

Q. That is your impression?

A. Yes sir.

RE-DIRECT-EXAMINATION,

By Mr. Jeffries.

Q. State whether or not you were working under the supervision of anybody, under the direction of any person, and who that was?

A. Dr. Teichmann.

Q. State what his instructions were to you?

A. His instructions were to take these samples according to the way I was directed, and he sent a man out with me,—I think his name was Unger, who was working in his office, and he showed me where to take the samples the first morning that I went out.

Q. That is, he showed you the particular place in the
971 river he wanted you to collect the samples each morning?

A. That's it.

Q. Now state whether or not you followed out those instructions?

A. I did follow them out as near as I could locate myself in the river. I tried to get the exact spot, as near as possible.

RE-CROSS-EXAMINATION,

By Judge Springer.

Q. How long a time elapsed between the time you took the sample nearest to the Illinois shore, and the time when you delivered them in the City Chemist's office or that other place, or the St. Louis Medical College in St. Louis?

A. Well from the time I took the first sample until I got to Dr. Teichmann's office, it was about two hours.

Q. Where did you take the first sample?

A. To Teichmann's office.

Q. Where did you take it in the river?

A. On the Illinois side.

Q. You began there?

A. Yes sir.

Q. And it was about two hours until you delivered that sample at the place designated in the City?

A. Yes sir.

EUGENE BRUNK.

972 JAMES GOLDEN,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT-EXAMINATION,

By Mr. Jeffries.

Q. What is your name?

A. James Golden.

Q. Where do you live?

A. 3010 North Market Street.

Q. St. Louis, Missouri?

A. Yes sir.

Q. How long have you lived in St. Louis?

A. Forty years, I was born there.

Q. You are about forty years old?

A. Yes, pretty near it.

Q. What business are you engaged in?

A. At the present time I am an inspector in the Sanitary Division of the Health Department.

Q. What were you doing between the months of May and July, 1900?

A. I was working under Dr. Teichmann at the Chain of Rocks getting samples.

Q. Who is Dr. Teichmann?

973 A. He is City Chemist.

Q. City of St. Louis?

A. Yes sir.

Q. What were you doing?

A. Getting samples of water for the City Chemist with Mr. Hart at the Chain of Rocks.

Q. When did you begin?

A. 8th of May, 1900, and I was getting samples until the 2nd of July. I used to transfer the wagon that held the samples in.

Q. Now state please where in the river you selected or collected the samples?

A. Well, I was taking out Mr. Hart and I together, on the Missouri shore about 300 feet from the bank. I used to get two large bottles, half-gallon, and then there was a small bottle for Dr. Ravold; then we went to the Illinois shore about the same distance from the shore.

Q. Three hundred feet or 300 yards?

A. Three hundred yards. Over there we took the sample at the Intake, floated down to the Intake, I should say two or three hundred yards north of the Intake in the river and get the next sample; then pull for the shore; then in the meantime we packed the bottles and they were corked like this (indicating).

That corked it under water. We would pull it up and 974 it would cork as we raised this machine. We took the bottle and sealed it and put a cloth on it, and tinfoil.

Q. Now just a moment. A few moments ago you said when you collected the sample on the Missouri shore, that it was three hundred feet from the shore.

A. Three hundred yards, more than three hundred feet; I know it was further than that.

Q. Look at complainant's Exhibit 15, and state whether or not that is a model of the instrument used in the collection of the samples?

A. That is the same kind of a bottle, and a larger one also.

Q. Now how far from the surface of the water did you collect the samples?

A. About three feet, three and a half feet.

Q. The full length of the instrument?

A. Yes sir.

Q. I understand you to say you collected the samples daily from three different places?

A. Yes sir, three different places in the river.

Q. State again clearly the place?

A. Three hundred yards from the Missouri shore, and the same distance from the Illinois shore, and about two or three hundred yards north of the Intake tower.

Q. Now then, the places were north of the Intake?

975 A. Yes, all north of the Intake.

Q. On a direct line with each other?

A. Yes sir.

Q. Now you say you commenced on the 8th of May, 1900?

A. Yes sir, and worked until the second of July.

Q. State whether or not these samples were collected daily and Sunday?

A. Daily, Sunday and every day.

Q. Where did you get the bottles that were used in collecting the samples?

A. We didn't get the bottles. We would go on the train and they went on the train with us in the morning, on the Burlington train.

Q. Where did they come from?

A. They came from the Chemist's office.

Q. What Chemist's office?

A. The City Chemist.

Q. Of the City of St. Louis?

A. Yes.

Q. Both large and small?

A. Both large and small.

Q. How were the small bottles packed?

A. They were wrapped in tissue paper.

976 Q. You put the small bottles in the machine, did you?

A. Yes sir.

Q. State how the water was kept out of the bottle until you got ready to fill it, and dipped it down into the river?

A. The bottles are air tight,

Q. What kind of a cork did you have?

A. The same kind of a cork that is in there now, a glass cork.

Q. There was no water went into the bottle until you wanted it?

A. Until this was raised (indicating).

Q. What do you mean?

A. Until the cork was raised.

Q. By the wire?

A. Yes sir.

Q. You pulled with your hand on the trigger?

A. Yes sir.

Q. Now after these samples were taken out of the river what did you do with them?

A. Immediately after taking them out we would take them out of the machine and they were wrapped and tagged.

Q. Wrapped how?

A. Wrapped with a cloth and tagged.

Q. Now then how about those small bottles?

977 A. There was tinfoil put over the bottle and a cloth and also wrapped in paper and tagged.

Q. What about being sealed?

A. Put a seal on them with sealing wax, and brought back to the Chain of Rocks and then to the City Chemist's office, St. Louis.

Q. What did you put on the tag?

A. Put the place that the water was taken from, the temperature of the water and the air and the time and by whom taken.

Q. Now then, if taken at the Missouri shore that would be three hundred yards out in the river?

A. Yes sir.

Q. And the same thing was true with reference to those taken on the Illinois shore and at the Intake?

A. Yes sir.

Q. How long did it take you to wrap and seal those samples?

A. Well, we would get out there at nine o'clock and bring them into the chemist's office around one o'clock. Mr. Hart had a good deal to do with it, and sometimes it would be three quarters of an hour longer, and would make it one or two o'clock.

Q. What did you do with them at the Chemist's office?

978 A. Bring them upstairs and unpack them out of the ice that they were on and Mr. Taylor would take charge of them, the large bottles, and the small bottles went to Dr. Ravold's laboratory.

Q. What was done with them?

A. Put on ice if he wasn't there.

Q. Well, if he was there?

A. He took charge of them himself, or his assistant did.

Q. Would he go right to work?

A. Sometimes he would and sometimes he wouldn't. As fast as we would come in. We were generally the first to bring the samples in.

Q. State whether or not you were instructed where to collect the samples?

A. We had instructions from Dr. Teichmann the City Chemist, where to take them, and we had detail instructions what to do with the bottles.

Q. You followed out the instructions the city Chemist gave you?

A. As closely as we could.

Q. Do you know whether or not Dr. Ravold gave you any instructions as to the small sample?

A. I couldn't say as to Dr. Ravold giving instructions, I think Dr. Teichmann's instructions covered it all.

979 Q. The instructions you received from Dr. Teichmann covered the taking of the small samples?

A. Yes, the small and large.

Q. You took them according to instructions?

A. Yes, according to instructions as near as it was possible to take them.

Q. And what you have said with reference to any particular sample taken here, as to what was done at that time, applies to every sample taken?

A. Every sample taken, the same thing was done with them.

Q. Did you state a few moments ago that these samples were packed in ice?

A. Yes sir, chipped ice.

Q. At the time they were wrapped?

A. They were wrapped and put in the ice immediately.

CROSS-EXAMINATION,

By Judge Springer.

Q. How long a time were you engaged in this manner?

A. From May 8th to July 2nd, I think it is July 2nd.

Q. Of 1900?

A. Yes sir.

Q. How long a time elapsed from the time you took the sample on the Illinois shore, nearest the Illinois shore, until you reached the Chemist's office in the city?

980 A. We generally left the Chain of Rocks, after we had the samples packed in ice, everything all packed and wrapped, at ten o'clock or a little after, and probably reached at one or half-past one the chemist's office.

Q. How long was it before you left the Chain of Rocks, that you had taken the sample nearest the Illinois shore?

A. Well, we had taken them probably an hour at the time they were packed in ice and everything packed.

We generally stopped over there an hour before we started in, to rest up the team.

Q. It is your opinion, as I understand it then, that the point at which you took these samples nearest the Illinois shore was about 300 yards?

A. About that to the best of my opinion, yes sir.

JAMES GOLDEN.

BENJAMIN FRANKLIN HART,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

981

DIRECT-EXAMINATION,

By Mr. Jeffries.

Q. What is your name?

A. Benjamin Franklin Hart.

Q. Where do you live?

A. Hotel St. Louis, Fourth and Locust.

Q. St. Louis, Missouri?

A. Yes sir.

Q. What business are you engaged in?

A. I am a water inspector for the water department.

Q. Of the City of St. Louis?

A. Yes sir.

Q. How long have you been engaged in that business?

A. I have been there about seven years.

Q. I would like to have you state what you were doing during the period of April to August, 1901.

A. Well, that is 1900, I was taking samples of water for Dr. Teichmann.

Q. Where were you taking those samples?

A. At the Chain of Rocks.

982 Q. Now when did you commence?

A. First of April, 1900.

Q. And when did you conclude?

A. The 15th of July.

Q. Now was it July or August?

A. The 15th of August, that's right.

Q. The same year?

A. Yes sir.

Q. State what particular place in the Mississippi River these samples were collected, place or places?

A. Well first we took the water from the Missouri side, about four hundred feet from the Missouri shore. We took that about eight o'clock in the morning, 8:00 A. M.; then we went across the stream and took the Illinois side, four hundred feet, that is, about nine o'clock A. M. Then we took at the Intake one bottle, on each side of the Intake, then we took a sample from the well.

Q. Where is that?

A. That comes from the Intake, into the tower house or pumping station.

Q. Before it is pumped into the reservoir?

A. Yes sir.

Q. From there where did you take the next sample?

A. Took a sample from one of the basins.

983 Q. One of the settling basins at the power house?

A. Yes sir.

Q. You say that the sample on the Missouri shore was taken 400 feet from the shore; do you mean 400 feet or 400 yards?

A. Four hundred feet.

Q. State whether or not you were directed as to the particular place the samples should be taken?

A. We had a stake driven on the Missouri side and on the Illinois side, and we were supposed to go into the channel. You see there are two channels there. Then, if the river was low we would have to take out where the channel was; we had a Missouri channel and a Mississippi channel.

Q. You always took it in the Missouri channel on the Missouri side?

A. Yes sir.

Q. Whether that would be 400 feet or 800 feet?

A. Well, if the water was pretty high.

Q. It depended on the stage of the water, did it?

A. Yes sir.

Q. Now with reference to the Illinois shore, state whether or not you always took the sample from the channel of the Illinois shore?

A. We always took it from the channel. We drove it down and took the water as we drove it.

Q. Now how far under the surface of the water did you

984 take it?

A. Three feet.

Q. I will ask you to examine Complainant's Exhibit 15, and state whether or not that is a model of the instrument used by you in the collection of these samples?

A. Yes sir. A small one of these for the City Chemist.

Q. For what?

A. For the City Chemist. We had three bottles in all, one directed to the City Chemist, and they were taken at the same time that the large ones were taken. They were taken in gallon bottles, a size a great deal larger than this.

Q. You don't know of your own knowledge that these small ones were taken for the City Chemist?

A. That is all I know, that we took them to the City Chemist.

Q. You took them all down there?

A. Yes sir, the big ones and little ones.

Q. That model 15 is the model of the instrument used by you in the collection of samples?

A. Yes sir.

Q. Both the large and small samples?

A. Yes sir.

Q. Now then, Mr. Hart, state what you did with those samples of water after you had gathered them; after you had taken them out of the river?

985 A. We put tinfoil on the small bottles; then we put a little piece of muslin over it, tied it around with a string and sealed it with the city seal; then the large ones the same way.

Q. Then what else did you do after you sealed it?

A. Packed them in a box.

Q. Did you put anything on it?

A. Put the wax and the seal on it.

Q. Then what else was there to indicate what it was?

A. That had a tag on it.

Q. What was on that tag?

A. First was the time and then the place where we took it; temperature of the water and the temperature of the air at the time we took it and the name.

Q. What name?

A. The inspsctor's name that took the water.

Q. The collector's name you mean?

A. Yes sir, the collector's.

Q. So if you took it you put your name on it?

A. Yes sir.

Q. Now then, where did you get those bottles?

A. They were sent up from the City Chemist's office in a 986 wagon.

Q. How were the small bottles wrapped?

A. Wrapped in tissue paper.

Q. Before they were used?

A. Yes sir.

Q. Now then, after these collections of water hal been prepared by you, wrapped, sealed and tagged, what else did you do with them?

A. We had wooden boxes, and there was a partition where we put the ice in between, and we put two big bottles on each side, which made four, and put the ice in the center.

Q. Upon them?

A. No, the ice was in a partition between them; it didn't touch them.

Q. You nailed those boxes up?

A. We had them locked; there was a spring lock on them.

Q. What did you do with them?

A. We sent them down to the City Chemist's office.

Q. Did you ever bring them yourself?

A. No sir, I loaded them on the wagon and sent them in. We were supposed to get them finished at eleven o'clock A. M. and have them all ready for the wagon.

Q. You were supposed to have them all ready for the wagon at eleven o'clock in the morning?

A. Yes sir.

Q. State whether or not you collected samples at any
987 other place than those two places in the river at this time?

A. Only the wet well.

Q. No other place?

A. The wet well and the reservoir.

Q. What kind of collections did you make in the reservoir and the wet well?

A. We had two large gallon bottles—we always took them every day.

Q. Did you make any smaller collections?

A. No sir.

Q. From the wet well?

A. No sir.

CROSS-EXAMINATION,

By Judge Springer.

Q. What period of time did you say your labors covered?

A. From the first of April to the 15th of August, 1900.

Q. And the places at which you took these samples were near St. Louis?

A. Yes sir, the Chain of Rocks.

Q. All at the chain of rocks?

A. Yes sir.

Q. How far did you state the stations at which you took the samples were from the Illinois shore?

988 A. It was about four hundred feet three or four hundred feet.

Q. From the Illinois shore?

A. Yes sir, but it was a good way from the Intake. It was about a half a mile up the river where these stakes were placed on both sides of the shore.

Q. Some of these witnesses stated that the place nearest the Illinois shore was about three hundred yards from the shore and you and one other witness testified four hundred feet. Now can you account for this discrepancy, or explain it?

A. I don't think the channel would allow it to be that wide. We had two channels there to take from. We had water coming from the Missouri River that clung to the Missouri side; then we had the Mississippi water that clung to the Illinois side, and we had to go into the channel of each one of those.

Q. Did you get in the channel of the Mississippi River when you were nearest the Illinois shore?

A. Yes sir, always; that was the Mississippi channel.

Q. Did you see anything of the Illinois River channel along there?

A. No, I don't know. We could always detect the dif-
989 ference because one was so much colored and the muddy river was on the other side of the river; that was the Missouri.

Q. The water on this side?

A. Was muddy water.

Q. It was the muddiest?

A. Yes sir.

Q. Was that water clean from the Missouri River?

A. Yes sir, dark.

Q. You are certain of that?

A. I know that, yes sir.

Q. In every instance did that occur?

A. Yes sir, when the river was high and low both; it was the same thing all the time over there.

Q. Where did the water come from the sample of which you took nearest the intake?

A. At the intake?

Q. Yes?

A. We got most of it from the Illinois side, because the opening of the intake was on the Illinois side.

Q. I mean what river did that water come from, the Missouri River or Mississippi River that went into the intake?

A. That was a sort of a mixture. It ground about three or four hundred yards, just in front of the intake, it
990 went around like a whirlpool.

Q. It seemed to be a meeting of the waters there?

A. Yes sir, a meeting of both of the waters.

B. FRANK HART.

ADJOURNED until 2:00 P. M., same day, Friday, February 27th, 1903, at Southern Hotel, St. Louis, Mo.

Southern Hotel, St. Louis, Missouri.
991 2:00 P. M., Friday, February 27, 1903.
Continuation after recess.

Present, the Commissioner, and same counsel representing the respective parties.

C. V. MERSEREAU,

called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, was examined in chief by Mr. Jeffries, and testified as follows:

Q. What is your name

A. C. V. Mersereau.

Q. Where do you live?

A. 3830 Shenandoah Street.

Q. St. Louis, Missouri?

A. Yes sir.

Q. How long have you lived in St. Louis?

A. About twenty years.

Q. What business are you engaged in, Mr. Mersereau?

A. Civil engineer.

Q. Civil Engineer?

A. Yes sir.

Q. What busness are you now engaged in?

A. Civil Engineering.

Q. In what capacity?

A. Assisstant Engineer in the water department.

Q. In the City water department?

992 A. Yes sir.

Q. Of St. Louis?

A. Yes sir.

Q. What were you doing from January 22, 1900, to May of that year?

A. I was working with men who were taking samples of water for the City Chemist.

Q. Where were those samples of water being taken?

A. Being taken at Bellefontaine bridge, from the Missouri River; at Alton from the Mississippi River; at Grafton, Illinois, from the Illinois River; from the Mississippi River, and for a short time at Elsah a short distance below Grafton. Also at Hartford about a mile above the mouth of the Missouri River. At the chain of Rocks, and at Peoria, and later on at Lockport.

Q. Now what particular part of that work did you have in charge?

A. I was supposed to look after the collectors and see that they took their samples correctly.

Q. State what directions you gave with reference to the gathering of samples of water at the Chain of Rocks?

A. Well the directions were plain to all the inspectors, but in regard to the location at the Chain of Rocks, they were to be taken about three hundred feet from the Missouri shore.

Q. Three hundred feet or yards?

993 A. About three hundred feet. Now that distance there may vary a little, according to the stage of the water. On the Missouri shore it was taken about 300 feet; at the Illinois shore at low stage of water, it would be about three hundred

feet from the sandbar; but at a higher stage of the water they may have taken them further from the bank.

Q. Now then, with reference to the channel of the river, where were those samples to the taken?

A. The samples were taken in good running water; the channel where the water was taken from the Missouri shore, is rather close to the Missouri shore.

Q. The channel is very close?

A. Yes sir. They went nearly over to the opposite side, and the samples were taken practically from the channel on the Illinois shore.

Q. Now then, where was the sample taken or where were your instructions given with reference to taking the sample at the Intake?

A. The samples at the Intake; they generally started to collect it about 100 feet,—about the in-let tower.

Q. Now do you know who you placed in charge at the Chain of Rocks to take those samples?

A. The first man there was Mr. Brunk, who was sent up there from the City Chemist's office,

994 Q. Do you know his initials?

A. Yes sir. Edgar B.

Q. Now was he there all the time that you had charge of this work?

A. No sir, he was only there for a few days.

Q. Then it was turned over to another party?

A. Then it was turned over to A. J. Winchell.

Q. Now who did you place in charge at Bellefontaine?

A. Fred Dieselhorst.

Q. Now what instructions were given him with reference to gathering these samples of water?

A. He was to take the samples about three hundred feet above Bellefontaine bridge, and get it out from the channel. When he first started taking those samples they were taken in that way, but part of them later were taken from the bridge.

Q. What were your instructions in taking all of these samples as to the particular depth below the surface of the water that they were to be taken?

A. When we first started, for a few days they had no machine then we had to reach down in the water uncork the bottle, let the water fill the bottle and then cork it under water; but after we received the machines the men were instructed to take the samples about three feet down below the surface of the water.

Q. Do you know the character of the instrument that
995 they used in gathering this water?

A. Yes sir.

Q. Is this it? (Indicating Complainant's Exhibit 15).

A. Yes sir.

Q. Now I will ask you to examine the complainant's Exhibit 15, and state whether or not that is the instrument or a pattern of the instrument placed in the hands of the water gatherers by you and your instructions to them when they were given charge of this work?

A. Those instruments were supplied to the collector; they were used, and instructions given.

Q. That is the pattern or model of the instrument you used?

A. That is the pattern, yes sir.

Q. Now do you know who had charge, or whom you placed in charge to gather samples at Grafton?

A. Wenzell,—the initials I am not sure of, but I think it was Albert J.

Q. Now at what place did he get samples of water?

A. At Wheelers' Ferry on the Illinois River.

Q. Now where is that?

A. It is about three miles above Grafton, three or three and a half.

Q. And about three miles—

A. About three miles above Grafton in the Mississippi River.

Q. Now what were your instructions to him with refer-
996 ence to where the samples should be taken, and how?

A. The samples in the Illinois River were to be taken far enough up the river to be sure to avoid any back water from the Mississippi. The samples from the Mississippi were to be taken far enough above Grafton to prevent any contamination from the Illinois River. A sample was also taken at Elsah, for a short time, about five or six miles down the river from Grafton.

Q. Now were those samples collected from these points during all the time that you had charge of this business?

A. The sample at Elsah I would not be sure, how long that was taken.

Q. Yes, but with reference to Grafton in the Illinois River?

A. Yes sir.

Q. And Grafton in the Mississippi River?

A. The samples were taken in the Illinois River and the Mississippi River at Grafton during the whole time that I had charge.

Q. When was the date that you commenced this work?

A. I believe I left the city January 21st, but January 23rd was the first sample.

Q. Now then when did your connection with this particular work cease?

A. First day of May.

Q. 1900?

997 A. 1900.

Q. And you commenced on the 23rd of January—of January, 1900?

A. Yes sir.

JUDGE SPRINGER: No. January, 1899, and May 1900, you say?

A. No, 1900 entirely.

MR. JEFFRIES: No, this is this man's particular period.

JUDGE SPRINGER: State that again.

A. From January 23rd, 1900, to May 1st, 1900, that was the period of time in which the work was being paid for by the water department direct.

Q. MR. JEFFRIES: Now you spoke of samples being collected at Hartford. Do you know whom you placed in charge there to collect those samples?

A. Mr. A. Huth.

Q. Now what was the character of the samples that were to be gathered by him with reference to quantity?

A. My recollection is that he was to take four bottles; they were to be five-pint bottles for chemical analyses and one for bacteriological samples.

Q. That was a smaller bottle?

A. That was a smaller bottle, yes sir.

Q. How much would those bottles hold?

998 A. The small bottles?

Q. Yes.

A. Oh, I should say a little less than—about a pint. That is one of the bottles (indicating).

Q. Now what you said with reference to the different characters or quantities of water that were selected by those men at Hartford, is also true with reference to these other collectors that you have also explained about; they not only took samples for the chemical analyses, but also for the bacteriological examinations?

A. Yes, they took both samples.

Q. In the small and large bottles?

A. Yes sir, at all places.

Q. Now do you know about what time they commenced to gather the samples at Hartford?

A. I think it was January 23rd or 24th.

Q. And they all commenced about the same time?

A. About the same time, yes sir.

Q. Now what were your instructions to this collector, with reference to how the collections should be made, and where?

A. They were to be made in the channel of the river which at Hartford is very close to the bank, and were to be taken as far under water as he could reach until the machine was obtained, and then they were to be taken three feet below the surface. The bottles were not to be opened in the air, but to
999 be opened under water and corked under water, as soon as the samples were taken.

Q. Now that was true with reference to the samples of water that were taken prior to obtaining this machine, known as Complainant's Exhibit 15, was it?

A. Yes sir.

Q. In other words, they were to do what?

A. They were to take the sample as far under water as they could reach.

Q. What about corking it under water?

A. They were to be corked under water.

Q. The empty bottle should be what?

A. Opened under water.

Q. And corked under water?

A. Yes sir.

Q. Uncorked under water?

A. Yes sir.

Q. And the water then let run in?

A. Yes sir.

Q. And corked up under water?

A. Yes sir. They were also instructed that if at any time the bottle should be partly filled with water and opened, that the bottle should be rinsed out, that is, with the river water and then cork the bottle and take the sample as though the bottle had not been opened.

1000 Q. You say you went up as far as Peoria?

A. Yes sir.

Q. Who did you put in charge at Peoria?

A. F. J. Brown.

Q. Now what were your instructions to him?

A. Similar to what I have already stated.

Q. Did you give him instructions as to the place in the Illinois river that he should obtain these samples?

A. We went to the bridge across the Illinois river at the upper part of Peoria and selected the place where the samples were to be taken and he was instructed to take all samples at that place.

Q. Now then, what were your instructions to all of these collectors with reference to the preservation of the water in its original state after it was taken out of the river?

A. As soon as possible the chemical sample was to be covered with cloth that was furnished for the purpose; it was securely tied, sealed and a tag put on the bottle.

Q. Now how about the bottle for the bacteriological department?

A. The bacteriological sample was to be covered with tinfoil; then with cloth and sealed.

Q. Were there tags or anything of that kind on these bottles?

A. Yes sir.

1001 Q. Now what was to be put on those—on the tags?

A. The date, the time of day, the point of collection, the temperature of the air; the temperature of the water, and the name of the collector.

Q. And what were your instructions to the collector or what instructions did you give your collectors in disposing of these samples of water?

A. As soon as they were sealed and tagged, that they were to be packed and delivered to the express office where they had to be shipped or brought to the city Chemist's office by the man who brought them in.

Q. To be packed how?

A. At first they had wooden boxes; they were packed in the wooden boxes with excelsior and delivered.

Q. Did you put anything in the boxes besides the bottles?

A. At the point when we started in, it was cold weather, and we didn't pack in ice, but later on there was an arrangement made that they were to be packed in ice.

Q. Now what were your instructions as to the time to be consumed in preparing these bottles of water for shipment, after they were collected?

A. They were to be delivered as soon as possible, and most of the inspectors—now you take the inspector for instance at Peoria, he generally made his collection in such time that he could then make connections with the train. The other men,
the men at Bellefontaine Bridge, Chain of Rocks, at Hart-
1002 ford, and at Alton, delivered the samples at the city
Chemist's office.

Q. Here in St. Louis?

A. Yes sir. And they generally collected the sample so that they just had time to prepare it, and catch the train and get to the City Chemist's office.

Q. Now at what other place did you station collectors, other than those you have mentioned?

A. Well, I believe about the first of February, I will not be sure of the date, Mr. Otten, who was collecting, was taken from Alton to Lockport, and two samples collected, one—or the first place was at the Bear Trap dam, right in front of the dam.

Q. Just above or below the dam?

A. Just above the dam. The second place was at the foot of McDonnough Street, if I remember rightly.

Q. Now what instructions were given him with reference to this?

A. The same instructions. He had also been taking samples at Alton, and followed the same system here.

Q. Now where did you get your instructions?

A. From Dr. Teichmann.

Q. Now in what way did you give these collectors their instructions?

A. Well all of us were given instructions in the first place
1003 by Dr. Teichmann, and then afterwards I simply went around to see that those instructions were followed out.

Q. State how often you would go to the respective collectors and see what they were doing, and how they were doing?

A. Well, I was going most of the time.

Q. State whether or not they knew exactly when you were coming to see what they were doing?

A. They did not; I had no regular routine of going around.

Q. Then state fully the purposes and objects of your visits to them after they had been stationed there?

A. To see that they were properly taking the samples, and to see that their expenses were being kept within proper limits.

Q. Now do you remember of any other collectors that were under your charge during that time?

A. I think I have mentioned Mr. Apel—Jacob Apel.

Q. Where was Mr. Apel stationed?

A. He went to Alton when Mr. Otten went to Lockport.

Q. How long did he stay at Alton?

A. Why he was still doing the work at Alton when I quit attending to the work.

Q. Now anybody else?

A. T. G. Ruff was sent to Grafton in place of Mr. Wenzell.

Q. Now do you know when Mr. Ruff was sent to Grafton?

A. Now I am under the impression that it was somewhere
1004 about the 6th of March—6th or 7th of March.

Q. Now state whether or not there were any others that you have not mentioned, that were under your charge?

A. Why, Mr. Winchell took the place of Mr. Brunk at the

Chain of Rocks, and later on Mr. Hart took the place of Mr. Winchell.

Q. What Mr. Hart?

A. B. F. Hart.

Q. Frank Hart?

A. No, I am mistaken about that; that is not B. F. Hart; it is Mr. E. Hart.

Q. Mr. E. Hart?

A. Yes, it was the one that testified this morning.

Q. Mr. Eugene Hart. Then it was Mr. Eugene Hart?

A. Yes sir.

Q. That took the place of whom?

A. Of Mr. Winchell.

Q. Now then, who took Mr. Hart's place if you know.

A. Mr. Hart, I think, was still working there when I quit.

Q. Now then, who else was under your charge in this connection?

A. Those were the only men.

Q. Now state the character of instructions that you gave each one of these collectors of samples of water. In other words, state whether or not the instructions that you gave to each one of them differs materially, or is not the same instruction that you gave to those that you explained in your testimony in the beginning?

A. The same instructions were given to all of the collectors.

JUDGE SPRINGER: Mr. Jeffries, the witness has not stated whether these instructions were in printing or not. The printed instructions would be the best evidence.

MR. JEFFRIES: Well I suppose we could get a copy of them.

THE WITNESS: When I started at work, we had no printed instructions.

JUDGE SPRINGER: You had none?

A. No sir, those came later.

Q. MR. JEFFRIES: Those instructions, you say, as to the precautions to be taken in the collection of these samples, were given to each one of the collectors?

A. Yes sir.

Q. Did you give them instructions as to where they would receive the bottles?

A. Yes sir. The men at Bellefontaine—at Alton and at Hartford received bottles at the City Chemist's office. The men at the Chain of Rocks, had the bottles delivered to them either at Baden or at the Chain of Rocks. At first—I am under the impression that for the first few days the bottles were obtained at the City Chemist's office.

1006 Q. That was for the Chain of Rocks?

A. That was for the Chain of Rocks, but later on they were either delivered at Baden or the Chain of Rocks.

Q. Now where were the bottles to be obtained for the collection of the samples of water at Peoria and Lockport?

A. At Peoria, Lockport and Grafton the bottles were sent by express.

Q. To the collectors?

A. To the collectors, yes sir.

Q. Where were they sent from?

A. From the City Chemist's office.

Q. State whether or not these collectors were instructed to use those particular bottles that were sent to them, or not?

A. They were instructed to use those bottles, but in case of accident they were instructed to buy bottles. I believe that one or two samples of water were sent in in bottles that had been bought.

Q. Now in those cases, the bottles were noted as having been bought?

A. I think so; I think the only case of that was at Peoria or Lockport, I have forgotten which it was.

CROSS-EXAMINATION, By Judge Springer.

Q. What is your occupation?

A. Civil engineer.

1007 Q. Civil engineer?

A. Yes sir.

Q. Did you have charge of all the samples that were collected between January 23 and May 1, 1900?

A. I think—It is my opinion that I had charge of all the samples that were collected during that time. That would be a matter of record, though, would it not?

Q. Yes. Did you prepare these bottles for use before they were sent out?

A. No sir, I did not prepare them for use, although I helped to pack a great many of them; also to send them out.

Q. Were these bottles sterilized before being sent out?

A. All of the bacteriological bottles were sterilized.

Q. Who did that?

A. I think that Mr. Taylor did that; he was the janitor in the City Chemist's office.

Q. You didn't do that yourself?

A. No sir, I did not.

Q. You know nothing about the method pursued?

A. No sir. All the work that I did in that connection was merely to expedite the work; it was really not part of my duty.

Q. Who furnished the collectors with the tags that they were to put upon the bottles?

1008 A. They came from the City Chemist's office.

Q. You didn't furnish them?

A. No sir; I generally saw that they had the tags when they asked for them.

Q. Yes sir, your business simply was to instruct the collectors as to what they should do with reference to taking these samples, and to send them to the different places?

A. To see that they did the work according to instructions, and to see that their expenses were kept within proper limits.

Q. Did you go to the places where the samples were taken at those times?

A. Yes sir.

Q. Where did you go personally?

A. I went to every place where samples were taken.

Q. You did?

A. Yes sir. Whenever I was at those places I helped the inspector take the sample.

Q. Do you know whether they were taken then in accordance with your instructions?

A. Yes sir.

C. V. MERSEREAU.

1009 **HENRY R. TAYLOR,**

Called as a witness in behalf of the complainant, being first duly sworn, by the Commissioner, testified as follows:

DIRECT EXAMINATION, By Mr. Jeffries.

Q. What is your name?

A. Henry R. Taylor.

Q. Where do you live?

A. 2659 Morgan.

Q. How long have you lived in St. Louis?

A. I have lived in St. Louis ever since March 6th, 1866.

Q. State whether or not you have ever been employed in the office of the City Chemist of the city of St. Louis?

A. Yes sir, I have.

Q. About when were you first employed in that office?

A. I think it was—about, well, 1895, I think.

Q. 1895?

A. Somewhere in there, I don't exactly remember.

Q. When did your connection with that office terminate?

A. It terminated the 13th—I don't exactly remember what day it was—the 13th about, a year ago, just about a year exactly, a little over a year.

Q. What were the duties that devolved upon you in that position? 1010

A. Well I was janitor of the building.

Q. I will ask you whether or not, if you had anything to do with the bottles that were sent out to the different persons who gathered samples of water from the Mississippi river and the Illinois river?

A. Yes sir, I did; I prepared all the bottles and shipped them.

Q. Now state how that preparation was done?

A. Well the bacteriological bottles, they were sterilized; they were washed and cleaned and dried and put in the oven at about 150 Centigrade, for an hour.

Q. Any longer than an hour?

A. Well some times; nothing shorter than an hour.

Q. Nothing shorter than an hour?

A. No, and sometimes longer.

Q. What was done with them after they were taken out of the oven?

A. They were left in there until they were cooled down, and after they were cooled, then they were taken out and wrapped in tissue paper, ready for shipment.

Q. Did you superintend the shipment of them?

A. Well, I did all the packing, and particularly most all the packing of those bacteriological bottles, shipped to all 1011 places.

Q. Now then, what was done in the preparation of the chemical bottles?

A. Well, they were cleaned and dried; they were not sterilized; they were cleaned and dried; they were air tight bottles; when they were brought to us, to see that they were air-tight, the corks were ground and the bottles numbered, and also the cork was numbered, the bottle and cork was numbered the same number, and then the cork was tied onto the bottle, so that in case that the string broke, or anything, they would always know where that cork belonged to and the chemical bottles were also air-tight—that is one of them now (indicating). That is the numbers (indicating). These are the bottles.

Q. Well never mind. How long did this work continue as your official duty there?

A. Well I was with it from the commencement until it was finished.

Q. You were there during the whole time of the investigation then?

A. Yes sir.

Q. In other words when you went into that office in 1895, you remained continuously there until—

A. About a year ago.

Q. February, 1901?

A. Yes sir.

1012 Q. What was the comparative size of the bottles that were sterilized and used for bacteriological samples?

A. They were about four ounces.

Q. What was the size of those used in the chemical department?

A. About gallons.

Q. What did you do with these bottles you say, after you had sterilized them?

A. They were allowed to get cold in the oven; after that they were taken out and wrapped in paper.

Q. What kind of paper?

A. Tissue paper.

Q. Then what was done with them?

A. Then they were ready for shipment; put in boxes for shipment.

Q. You put them in the boxes, did you?

A. Yes, I put them in boxes for shipment.

Q. Now what was done with those used in the chemical department?

A. We had a place for them; we kept them on the shelf, and packed and shipped them in the same way; we had both big and little boxes.

Q. Do you know who they were shipped to, or expressed to?

1013 A. To the collectors, whoever they were; I can't recall them all, I don't remember, but I know I shipped to all the stations that we had.

Q. Can you name some of those stations?

A. Yes, we shipped them to Chicago and some to Peoria, Grafton, and also prepared them for the Chain of Rocks. The bottles for the collectors that brought in the samples, of course they wasn't shipped; they took their bottles and brought them in, and the bottles were always ready for them.

Q. Now these chemical bottles were sent out also, were they not?

A. Yes sir.

Q. In the same way?

A. In the same way. Those were packed in boxes, four in a box, or four or two, whatever the station may require, the same number as the bacteriological bottles, whatever the station may require, whether it was two or four or more.

Q. I will ask you if you know what that is (handing witness a bottle).

A. That is one of the bottles that we used for chemical samples.

Q. Is that one of the bottles that was actually used in this work?

A. Yes sir.

Q. How do you know?

1014 A. From the number. I know every bottle that was in the business.

ATTORNEY-GENERAL CROW: Is the number on the bottle?

A. Yes sir, and the cork both.

Q. MR. JEFFRIES: What is the number on the bottle?

A. Fifty-three.

Q. What is the number on the cork?

A. The same.

Q. That is the same kind of bottle that was used for all the chemical experiments, was it?

A. Yes sir, excepting in a few cases, when we run short of them; then we used another bottle, a half gallon bottle.

Q. That was only in a few cases?

A. Yes sir, that was only in a few cases; but this is the same bottle.

ATTORNEY-GENERAL CROW: Made in the same way?

A. Yes sir—well, this is a mushroom top; some of the bottles didn t have the mushroom top; they had a square top.

Q. MR. JEFFRIES: They all had the number on?

A. Yes sir.

Q. Both on the bottle and the cork?

A. Yes sir. The cork was investigated to see if they were air-tight. If the corks wasn't air-tight they were ground.

1015 MR. JEFFRIES: The complainant now offers the bottle identified by the witness as having number 53 scratched on the body of the bottle, and number 53 on the cork, as complainant's Exhibit No. 16.

Said exhibit received in evidence and marked by the Commissioner "Complainant's Exhibit No. 16. Frank S. Bright, Commissioner."

JUDGE SPRINGER: Will you state that it is a glass bottle holding how much water?

Q. How much does this bottle hold?

A. About one gallon.

MR. JEFFRIES: He stated that before.

JUDGE SPRINGER: What kind of a stopper?

MR. JEFFRIES: Mushroom shaped glass stopper, is it?

A. Yes sir, we have others square shaped.

Q. Now I will ask you if the glass bottle attached to and forming a part of Complainant's Exhibit 15, is one of the bottles that was used in the bacteriological examination?

A. Yes sir, that same kind of a bottle.

Q. I will ask you if these were—if that is one of the pattern that you referred to in your examination and which you stated you sterilized?

A. Yes sir, that is the kind, sir.

1016 CROSS-EXAMINATION, By Judge Springer.

Q. How long a period does this time cover, in which you have been employed in the Health Department of St. Louis?

A. Well it covered from the time—from the commencement of the work until the practical ending of it.

Q. Give the dates, please?

A. Well, up to about a year ago. I went in the office about 1895, and that is about a year ago I quit, a little over a year.

Q. When did you begin to take samples of water for examination?

A. Well, I don't remember the dates that I commenced to take any of them. I used to take samples occasionally up to Grafton and Chain of Rocks, but I don't know the dates, because I didn't have that to do regularly; I would only do that occasionally.

Q. During the period to which you have referred were all the bottles used for the purpose of taking samples for examination, prepared by you?

A. Yes sir.

Q. You stated that they were sterilized. Explain that again, please?

A. The bacteriological were all sterilized, yes sir.

1017 Q. The bacteriological bottles were all sterilized?

A. Yes sir.

Q. What temperature did you state they were subjected to?

A. About 150 degrees centigrade.

Q. What would that be Fahrenheit?

A. Well I don't know; that is what I run them to.

Q. Do you know how to transpose them from Centigrade to Fahrenheit?

A. No sir, I don't.

Q. It would be about 270 degrees Fahrenheit, as I understand it. It would be above the boiling point anyway, wouldn't it?

A. Yes sir, oh yes,

Q. The Centigrade thermometer begins at freezing point and runs to boiling point, 100, isn't that right?

A. Yes sir.

Q. And Fahrenheit begins at 32 below freezing and runs to boiling point. What is that, 212 degrees?

A. Yes sir.

Q. This would be above the boiling point then?

A. Yes sir.

Q. And they remained an hour?

A. An hour or longer, but not less than an hour.

Q. Was that sufficient to kill all kinds of germs?

A. Yes sir, so I was informed by the bacteriological—by Dr. Ravold; that that was sufficient to kill them all. 1018

Q. That was according to his instructions?

A. That was according to his instructions, yes.

Q. You followed his instructions as near as you could—as near as possible?

A. Yes sir.

HENRY R. TAYLOR.

1019 FRANK J. BROWN,

Recalled as a witness in behalf of the Complainant, testified as follows:

DIRECT EXAMINATION, By Mr. Jeffries.

Q. What is your name?

A. Frank J. Brown.

Q. Now I will ask you to examine that and state what that is? (Handing witness paper.)

A. It is a tag that I put on the bottle that I shipped by express from Peoria, Illinois, to the City Chemist's office, city of St. Louis, on the 3rd of May, 1900.

Q. What do you say you put that on?

A. On one of the samples of water that I sent to Dr. Teichmann, City Chemist at St. Louis, from Peoria, Illinois, where it was shipped from. The sample was taken three miles above.

Q. Read all that there is on that card?

A. Date, May 3rd, 1900;
Time, 9:00 a. m.;
Location, Illinois river, three miles above Peoria, Illinois;
Temperature of air 52 degrees above;
1020 Temperature of water 61.
Name of collector: Frank J. Brown;
Gauge of the river that day was 34.30;
Weather clear.

Q. Was that temperature Centigrade or Fahrenheit?

A. That was Fahrenheit.

MR. JEFFRIES: Now we will offer this card or tag, identified by the witness, in evidence as complainant's Exhibit 17.

Said tag received in evidence and marked by the Commissioner "Complainant's Exhibit No. 17. Frank S. Bright, Commissioner." And is in words and figures, as follows:

"Date: 5/3/00.
Time: 9 A. M.,
Location: Illinois river, three miles above Peoria, Illinois.
Temp. Air: 52 above.
Temp. Water: 61 degrees above.
Name of Collector: Frank J. Brown.

On the opposite side appears the following:

"Gauge of River: 34.30,
Weather clear.
No. 1346."

Q. Now all samples collected by you were tagged with a similar tag to this?

1021 A. Yes sir.

Q. I will ask you whether or not the same data was put on those cards or on those tags by you as has been registered on this one?

A. Yes sir, same thing.

Q. Depending altogether on the variations of the temperature of the weather and the water?

A. Yes sir.

Q. And this practice you followed from the beginning of your connection with the work until the end?

A. Until the end of it, yes sir.

CROSS-EXAMINATION, By Judge Springer.

Q. Are those tags before you on the table those which you put upon the bottles and forwarded to the laboratory in St. Louis?

A. Why, they are the kind I put on, yes sir.

Q. And the one you have is a specimen of all of them?

A. Yes sir.

MR. JEFFRIES: That is the tag that you actually put on the bottle that you identified?

A. I actually put it on the bottle.

JUDGE SPRINGER: Just glance through those and see 1022 if they are, or appear to be the same kind?

A. Yes sir, there are several here that are in my writing, yes sir, that I prepared.

(Subsequently called again.)

1023

JACOB APEL,

Called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION, By Mr. Jeffries.

Q. What is your name?

A. Jacob Apel.

Q. Where do you live Mr. Apel?

A. I live now at 2026 South Second Street.

Q. St. Louis, Missouri?

A. Yes sir.

Q. How long have you lived in St. Louis?

A. All my life—thirty-three years.

Q. Were you ever connected with the water department of the city of St. Louis, or the Health Department?

A. Yes sir.

Q. Are you connected with them at the present time?

A. No sir.

Q. I will ask you if you were connected with the Water Department or the Health Department rather, in 1900?

A. Well, I don't know whether I was connected with the Health Department then; I was working for the Water Department when I first started to get this water.

1024 Q. What water?

A. The water that I got up the river at Alton?

Q. What did you get the water for?

A. Samples.

Q. Who had you get them; who employed you; under whose instructions were you?

A. Dr. Teichmann's.

Q. Dr. Teichmann's?

A. Yes sir.

Q. Now who is Dr. Teichmann?

A. City Chemist.

Q. Of the city of St. Louis?

A. Yes sir.

Q. Now then, when did you commence getting this water?

A. The 27th day of February, three years ago today.

Q. That would be the 27th of February when?

A. 1900—three years ago today, is the first day I went up there.

Q. Now then, how long did you continue your work of gathering samples?

A. Up until September. I don't know whether if was the 17th or 18th, was the last date I got water; in September of that year.

Q. Of that year 1900?

A. Yes sir.

1025 Q. Now state, Mr. Apel, where you got these samples of water?

A. Up in Alton, right about—well about half a mile above the Waterworks in Alton, or a mile above the Waterworks, out in the channel of the river.

Q. Now how did you obtain those samples?

A. With one of these machines, something like that there (indicating Complainant's Exhibit 15).

Q. Now I will ask you to examine Complainant's Exhibit No. 15, and state whether or not that is a model of the instrument used by you in gathering these samples of water?

A. Yes sir, that is the machine we used for to get the sample bottle of water.

Q. Now what difference was there between the machine used in obtaining the small bottles of water and the machine used in obtaining the large bottles of water?

A. What difference?

Q. Yes, was there any difference in the construction or in the size?

A. For the large bottles, the machine was larger, and the bottle was larger.

Q. And that was all the difference?

A. Yes sir.

Q. And the construction of the machine is the same?

A. Almost the same, I suppose, as I understand or know about it.

1026 Q. Now state how far under the surface of the water these collections were obtained?

A. Why, I guess it was about four feet.

Q. The full length of the arm of the machine?

A. The full length of the arm of the machine, yes sir.

Q. Where did you get the bottles that you got the water in?

A. At the City Chemists' office.

Q. Did you get them personally, or did he send them to you?

A. I got them myself, personally.

Q. How often would you get them?

A. Every morning.

Q. How long would it take you to make the trip?

A. I would get back around two o'clock in the afternoon.

Q. What time would you go there to make the collection?

A. Make the collection between ten and 10:30.

Q. Now what would you do immediately after you made the collection?

A. Seal up the bottle, go to shore at first, and seal up the bottles and then take them up in the Waterworks and fix it up —seal it up, and fix up my tag.

Q. These small bottles, what would you put around them first?

A. Tinfoil.

Q. Then what?

A. Seal it up.

1027 Q. Before you sealed it did you put something around it besides tinfoil?

A. I think I put a rag over it.

Q. You put the tinfoil on first?

A. Yes sir.

Q. Then the rag; then the seal?

A. Yes sir.

Q. Now then, what else would you do to it?

A. Fix up my tag; tie my tag around it.

Q. What was there on that tag? What would you put on that tag?

A. Take the temperature of the water and the temperature of the air, the time I got the water, and so forth.

Q. And the gauge of the river?

A. No.

Q. Then as soon as the package was prepared what would you do with it?

A. Put it in my box.

Q. Then what?

A. Take it back to the depot and go on home; when a train would come along—I would wait for the train to come.

Q. And you would go direct to the City Chemists' office?

A. Yes sir.

Q. What did you do with it?

1028 A. I gave it in the City Chemists' office; put it in charge of the man there.

Q. Now I will ask you to state whether or not the same disposition was made of every collection that you made?

A. Yes sir.

Q. You delivered them to the City Chemist's office?

A. Yes, every one of them.

Q. How many collections did you make? Did you make collections each day?

A. One. There was two or three days I made two. That is when the boat went up the river and dropped stuff into the water, and I had a boat and kept pulling in across the river, and just kept dipping up, dipping up, all the time. They dropped some stuff in there, but I don't know what that was for.

Q. Did you deliver the small bottles to the City Chemist's office also?

A. All of them; all of the bottles.

Q. How did you open the bottle to let the water in?

A. Opened it under water.

Q. Did you ever open it out of water?

A. No sir.

Q. Who were you working under; who instructed you about how to gather the samples?

1029 A. Why, Dr. Teichmann and this other man. I forget his name; I don't know his name.

Q. Did you hear him testify?

A. I came in just as he got through. I forget his name—Mersereau, I think that is his name; some name like that.

Q. Now, you carried out his instructions, did you?

A. Yes sir.

Q. And that was with reference to every sample that was collected?

A. Yes sir.

Q. How long did you say you worked?

A. I worked from February 27th up until September 17th or 18th; I ain't certain of that date—February 27th was my first trip.

Q. Did you get collections at any other place than at Alton?

A. No sir, that is the only place.

CROSS-EXAMINATION, By Judge Springer.

Q. How long a time elapsed from the time you took the samples from the river until you delivered them to the City Chemist's office, in St. Louis?

A. Well, until I would get down here; that would be about between ten and half-past ten I would get the water, and I
1030 would get down here about two o'clock.

Q. Then you left the samples with somebody in the City Chemist's office?

A. Yes sir.

Q. Well who was that person, if you know?

A. Well, I don't know exactly his name; I know him when I see him. Dr. Teichmann used to be there a whole lot of times, he would be there and receive it, or Mr. Thomas Buckland, the assistant. Either he or Dr. Teichmann received the samples.

Q. Did you use any ice in packing these samples?

A. Yes sir, when the water got warm—when the weather was hot. I didn't use it in February.

RE-DIRECT EXAMINATION, By Mr. Jeffries.

Q. I will ask you to examine Complainant's Exhibit 16, being the gallon bottle used in obtaining chemical samples, and state whether or not that is one of the same kind of bottles that you used in obtaining samples in the Mississippi river at Alton?

A. Yes sir; that there was used, and also this here one (indicating).

Q. Well, we are talking about this one now.

A. Yes.

Q. This is the particular bottle used?

A. Well, part of the time.

JACOB APEL.

1031 DR. WILLIAM C. TEICHMANN,

Called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION, By Attorney-General Crow.

Q. What is your name?

A. William C. Teichmann.

Q. How old are you doctor?

A. Forty-three.

Q. Where do you live?

A. 3624 Shaw Avenue.

Q. Whereabouts, at what place?

A. That is about a half a block west of Grand Avenue.

Q. Is it in London or St. Louis?

A. St. Louis.

Q. Do you occupy any office in the city government of this city?

A. Yes sir, I am City Chemist.

Q. How long have you been City Chemist?

A. Since April, 1893.

Q. Well, doctor, do you occupy now the position of City Chemist?

A. Yes sir.

1032 Q. Now do you have any recollection about the chemical and bacteriological investigation of the waters of the Mississippi and the Missouri river, and the Chicago Drainage Canal and the Illinois and the Des Plaines river having been begun along in 1899 and continued through 1899, 1900, 1901 and 1902?

A. Yes sir.

Q. What connection, if any, did you have with any of that work?

A. I had charge of the chemical part of the investigation.

Q. Well, when you say you had charge of it, just explain what you mean by that?

A. Well, I organized the system of the collection of the samples, and—

Q. Well, the chemical samples or the bacteriological samples?

A. The chemical samples.

Q. Well, go ahead and explain what you did, how you organized it?

A. Well, the system varied according to the period of investigation. The first period of investigation began on July—let's see, I will have to look up my data here to be absolutely correct. On August 23rd, 1899, the first period of investigation began which continued until January 22, 1900.

1033 Q. You say you organized the chemical portion of that; what do you mean by organized it; just tell what you did, who you had to work for you and how they operated. That is what I want to know.

A. I was ordered by the Health Commissioner of St. Louis, the superior official of my department, to take samples of water for chemical examinations from the mouth of the Illinois river and the Illinois river itself, as well as from a point in the Mississippi river not very far above the mouth of the Illinois, and then to take samples between the mouth of the Illinois river and the Chain of Rocks. These samples were not taken at regular intervals; they were only taken from the mouth of the Illinois river at such times when the harbor boat of the city of St. Louis was available and when the funds permitted us—the limited funds —to send a collector of samples to Grafton, and to take the samples there as directed by myself.

The total number of samples collected during this period was 142, and they were taken from the following points, shall I enumerate those points?

Q. Yes, just give the points.

A. Mississippi river, Chain of Rocks, near Intake Tower, of St. Louis, 26 samples. That is of the St. Louis Waterworks I mean, 26 samples.

1034 Mississippi river, Chain of Rocks, Missouri shore, three samples.

Mississippi river, Chain of rocks, Illinois shore, three samples.

St. Louis Waterworks, distributing well, 28 samples.

Q. What do you mean by distributing well? Explain that. I don't know what you mean. Do you mean the Intake?

A. No, the water enters the St. Louis Waterworks through the tunnel under the river.

Q. You mean what we call the Up-take?

A. Yes. After it has passed through the reservoirs, it goes in there, goes into the mains of the city of St. Louis, and the distributing well is where the water is distributed among the reservoirs, after it enters the waterworks from the river through the Intake, at the tunnel, called the distributing well.

Q. Well, you call that the Up-take; that has been explained; we know what that is, the Up-take.

A. Yes sir.

Q. Go ahead.

A. Mississippi river, Madison landing, between Chain of Rocks and the mouth of the Missouri river near the Missouri shore, three samples.

1035 Mississippi river, Madison landing, between Chain of Rocks and the mouth of the Missouri river, near the Illinois shore, seven samples.

Mouth of the Missouri river, ten samples.

JUDGE SPRINGER: Where is that—mouth of the Missouri river?

A. Mouth of the Missouri river?

JUDGE SPRINGER: Where is that? We never heard that before. Was this at Bellefontaine?

A. No, not at Bellefontaine; that was at the mouth, at the confluence of the Missouri and Mississippi rivers.

JUDGE SPRINGER: This is a place that has never been mentioned before.

A. No it has not. You see these samples were all taken on the trips made by the harbor boat, and we ran into the mouth of the Missouri river on such occasions.

Mississippi river points between Alton and the mouth of the Missouri river, thirteen samples.

Mississippi river, near Clifton Terrace, between Alton and Portage, six samples.

Mississippi river at Elsah, near Piasa Bluffs, between Portage and Grafton, five samples.

Illinois river at points located one, two, three and five miles above Grafton, 19 samples.

1036 Mississippi river at points one, two, three and five miles above the mouth of the Illinois river, 19 samples, which makes a total of 142 samples.

Q. With reference to the stream where were these taken; from the center of the stream or the channel?

A. Always taken from the stream, from the channel.

Q. From where the current ran?

A. Yes sir.

Q. Well now, who took those samples?

A. Those samples were taken either by myself or the assistants, or they were taken by Henry R. Taylor, Sr., the janitor who testified a short time ago, or his son, H. R. Taylor, Jr.

Q. Were you present when they were all taken?

A. No sir, I was not.

Q. Do you know what ones of them you took?

A. Yes, I can identify those from the tags, or they were taken from Assistant Collector of samples and helper at the distillation table, Herman Ungar.

Q. Where is Ungar?

A. He was at that time assistant collector.

Q. Where is he now?

A. He is in the city now, I presume.

Q. He is alive is he?

A. I don't know; I haven't seen him for a long time.

Q. Well now, what was done with those samples after
1037 they were taken?

A. These samples were taken to the City Chemist's office, St. Louis.

Q. What was done with them there?

A. They were analyzed by myself and my assistant, Mr. Thomas A. Buckland.

Q. In the first place, how did you take these samples? How did you take them? They were taken in bottles, weren't they?

A. Yes sir, I am just trying to recollect during what period they were taken in demijohns, and what periods they were taken in bottles with the machine.

When we began the work, August 23rd, and from that time on for about two months, we collected these samples in demijohns by holding the demijohn in the hand and filling the demijohn under the surface of the water. After two months we had certain machines made, and certain bottles placed in these machines, and the samples were then collected under the surface of the water, by dipping the machine under the water about three to four feet below the surface.

Q. What is the number of that exhibit, that bottle?

THE COMMISSIONER: That is Exhibit 16.

ATTORNEY GENERAL CROW: Is that exhibit No. 16 the character of bottle that you used?

1038 A. Not during that period; we used a smaller bottle, half gallon bottle for the machine.

Q. Were those bottles sealed when they were taken from the water?

A. Yes sir every sample.

Q. What were they sealed with?

A. There was always a rag tied over the stopper and the neck of the bottle or demijohn, and tied very closely around with a string, and a tag was attached to the neck of the demijohn or bottle, and sealing wax was used to attach the tag,—the string of the tag to the neck of the bottle, and the seal which we used at the City Chemist's office—City Chemist's office numbe so-and-so was pressed on the sealing wax, and thus the bottle identified. It was never opened—the seal could not be broken except by myself or my assistant, when we would proceed with the analysis in the laboratory.

Q. Well, who received these bottles when they were sent to the laboratory from August, 1899 up to what period did you say?

A. To January 22, 1900.

Q. To January 22, 1900, who received those?

A. Either myself, or my assistant, Mr. Buckland.

Q. Well, do you know whether or not you kept a record of the receipt of those bottles other than by the tags?

1039 A. No sir, we didn't keep a record of that kind; we had the record of the analysis.

Q. Well, now have you got those tags that came on those bottles?

A. Yes, I have them.

Q. Where are they? Here in the room?

A. Yes sir.

Q. Now these tags were taken off the bottles and numbered, were they?

A. Yes sir.

Q. To correspond with the number on the bottle?

A. Yes sir.

Q. That was done all the way through that period?

A. Yes sir, either by myself or my assistant, Mr. Buckland.

Q. Do you know whether these tags that you have here now are the identical tags that came on those bottles?

A. Yes sir, I have identified them as such today.

Q. Now were those bottles properly sealed and handled from the time that they were filled with water until the chemical examination was made in accordance with the proper rules for the conduct of chemical analyses of water?

A. Yes sir; whenever they were not, we would throw out the sample and not analyze it.

1040 Q. Well, answer my question Yes or No?

A. Yes sir.

Q. Now you are acquainted with what the proper method is in handling those things preparatory to making a chemical analysis of water?

A. Yes.

Q. You have had experience in the chemical examination of water?

A. Yes sir.

ATTORNEY GENERAL CROW: Now, Judge, this period now covers from the 10th of August, 1899, up to the 2nd of January, 1900. Now he testifies that he has got all the tags here numbered with the corresponding number on the bottle, and he or his assistant there in his office took them all and we can just let the record show that these are in evidence, but not made a part of the record proper, but can be used by either side as evidence if they want to refer to them.

JUDGE SPRINGER: That is satisfactory.

ATTORNEY GENERAL CROW: Then we will just consider them in evidence.

Q. Now go to the next period—the next period, Judge, begins on the 23rd of January.

JUDGE SPRINGER: Did you want to qualify him as an expert now, or leave that to some subsequent period?

ATTORNEY GENERAL CROW: Well, I have not asked 1041 him about any examination, you know; but I have qualified him as to his knowledge of the method to be pursued in taking care of water preparatory to its analysis. If you prefer, I can qualify him to speak on that.

JUDGE SPRINGER: You can pursue your own course;

I just wanted to know whether or not you were going to do that at this time.

ATTORNEY GENERAL CROW: My intention was to prepare him when I put him on the stand afterwards.

JUDGE SPRINGER: Just as you like.

Q. ATTORNEY GENERAL CROW: Where were you educated?

A. I was oringinally educated at the Washington University, academic department.

Q. Where did you receive your medical education?

A. I have no medical education; it is chemical.

Q. Chemical?

A. I left the academic department of the Washington University in 1875, and entered in the fall of 1875, the polytechnic College of Brunswick, Germany. I studied chemistry at that college from 1875 to 1879, until the summer of 1879. In the fall of 1879 I proceeded to Berlin and entered the University of Berlin.

Q. Berlin, Germany?

A. Berlin, Germany, yes, and studied chemistry and a
1042 number of other corresponding branches like history and
literature, for general educational purposes, in the University of Berlin from the year 1879 until 1881.

In Berlin I studied principally under Professor Ferdinand Tiemann, who is considered one of the leading authorities on water analysis, and the author of a well known standard work on water analysis.

In 1881, in the summer, I left the University of Berlin and studied what they call the Semester, that is a half year's course in the University at Liepsic, and in the spring of 1882—

Q. Well, what did you study at Liepsic?

A. Well there I studied history, and at the University of —Then I proceeded to the University of Munich in Germany and studied history from 1882 until 1885, and I graduated as a doctor of philosophy in chemistry and history in the year 1885, from the University of Munich.

Q. Munich where?

A. Munich, Germany.

Q. Well, then you have had practically ten years of education as a chemist and along the lines that a chemist is educated?

A. Yes, about six years, of which,—or five years strictly confined to the study of chemistry.

1043 Q. Now in your studies, did you make any specialty of the study of the analysis of water?

A. I did that at the University of Berlin, under Professor Tiemann.

Q. Now what experience have you ha since you left the University at Munich, Germany, in 1885?

A. In 1885 I returned to this country, and entered a literary career, that is, I was principally occupied in literary pursuits until 1890. I again took up the chemical pursuit and became the private assistant of Professor Charles O. Curtman, Professor of Chemistry in the Missouri Medical college.

Q. At St. Louis?

A. Yes sir. In 1891 I became the assistant instructor of chemistry, as assistant to Professor Curtman, in the Missouri Medical College, which position I retained until 1895. That is, both the position as private assistant to Professor Curtman, as well as assistant instructor to Professor Curtman in the Missouri Medical College, and as private assistant of Professor Curtman, I assisted in quite a number of analyses of water.

In 1893 I was appointed City Chemist of St. Louis and I have occupied that office since that time.

Q. Since 1893?

1044 A. 1893.

Q. Well now, as the City Chemist of this city, what line of work in Chemistry have you been called upon to follow?

A. The duties of the City Chemist are multifold. There is first of all, analytical work for the Health Department of St. Louis, which includes a constant analysis of samples of well water and of cistern water.

Q. That is continuous work, is it?

A. Yes, that is some branch of it; then the analysis of disinfectants used by the Health Department; the analysis of all kinds of medicines, of articles of food, which are purchased by the city institutions, and which require an analysis occasionally. That is the work of the Health Department. Then I perform the toxicological work for the police department—

Q. Now explain what you mean by that term?

A. Toxicological analysis would be the analysis of various kinds of articles, either in liquid form or in solid form, which involve some kind of foul play, that is the use of poisons, the use of knockout drops; samples of opium; samples of dynamite, on occasions of the use of such materials for criminal purposes. The analysis of blood-stains, etc.

Then another kind of work performed by this office is the toxicological work for the Corner's office, that is the an-
1045 alysis of viscera in cases of suspected poisoning, or an-
alysis of chemicals and of articles of food which are suspected of containing poison, in cases involving an accused murderer, and such things.

Then I also analyze or make analyses for the School Department of St. Louis, for the Board of Education, analyzing the air in the school rooms to find out the character of the atmosphere judged by the carbonic acid gas found, etc., by the impurity of the atmosphere.

Then, finally, I perform analytical work for the Water Department, that is in making a daily analysis of the water from the City water supply.

Q. When you use the term water supply, what do you mean? Do you mean the reservoirs, the Intake or the taps?

A. Well, in 1899, since this investigation began, I have analyzed the water from the Chain of Rocks, not only for this litigation, but also for the water department, in order to give them a correct daily record of the water supplied to the city.

Q. Prior to 1899 where did you take the water which you analyzed?

A. Well, in 1899, I took the water from the reservoir, one of the reservoirs.

Q. Prior to August, 1899?

1046 A. Well, prior to August, 1899, the analyses were more
of a sporadic character; that is, there weren't regular intervals—it was only at times when the Board of Health just wanted to know how the City water supply was; its chemical character, I was ordered to make analyses. I took samples then from the tap, and on one occasion, in the year 1893, in October, I took a number of samples from the mouth of the Illinois, and

from various points, about twenty-two samples, from various points between the mouth of the Illinois and the Chain of Rocks, but that was only one collection made, and I consider that analytical survey of a sporadic character, and I don't consider myself justified in drawing definite conclusions of the character of the water at that time from this sporadic series of collections. I wasn-t authorized, and not allowed to take more samples.

Q. Now you say samples taken from August 11, 1899 to January 22nd, 1900, were properly cared for chemically, as water should be that was going to be used for the purpose of making analyses thereof, from the time it was taken from the river to the time it was opened for the purposes of being analyzed?

A. Yes sir.

Q. Now go to the next period, doctor, beginning January 23rd, 1900.

A. This period begins on January 23, and ends for the
1047 larger part of the collection of the samples on October 11th.

Q. What year?

A. 1900.

Q. Well, do you know how many samples of water were taken?

A. Yes sir.

Q. How many?

A. Well now, I have not got the total figure. I have got the total number collected at each collection point during that period.

Q. Never mind the total number.

A. By the way, I have the number here,—3492 samples were collected from January 23rd until October 11th.

Q. Now where were they taken from, just give me the points.

A. They were taken from the following points—Shall I give the number of samples taken at each point?

Q. Oh, just as you like about that?

A. Well just as you direct.

Lake Michigan, Drainage Canal above the Bear Trap Dam at Lockport,

Des Plaines River at Joliet,

Illinois River, three miles above Grafton, Illinois,
Illinois River at Wesley, Illinois,
Illinois River at Pekin Bridge, Illinois,
Illinois River three miles above Pekin, Illinois,
Mississippi River, two miles above Grafton, Illinois,
1048 Mississippi River one mile above Alton, Illinois,
Mississippi River opposite Hartford, Illinois,
Missouri River opposite Fort Bellefontaine, Missouri,
Mississippi River near Missouri shore, at Chain of Rocks,
Mississippi River near Illinois shore at Chain of Rocks,
Intake tower, St. Louis Waterworks, Wetwell,
St. Louis Waterworks, outlet of reservoir,
Tap at City Chemist's Office at St. Louis,
Harbor boat and special samples.

Now this period extended for part of the points, these collections of samples therefrom extended until November 30th, by which I mean to say that there were samples outside, or samples continued after October 12th, or samples taken from the following points, until November 30:

Lake Michigan,
Lockport,
Illinois & Michigan Canal, Lockport,
River Des Plaines above the Chicago Drainage Canal, Lockport,
Ninth Street bridge, Lockport,
Drainage Canal, Bear Trap Dam,
Joliet—Des Plaines River,
1049 Illinois River three miles above Peoria,
Illinois River above Grafton—that is three miles above Grafton,
Illinois River three miles below Pekin,
Mississippi River two miles above Grafton,
Mississippi River one mile above Alton,
Mississippi River, Hartford,
Missouri River, Bellefontaine.

The entire number of samples analyzed from August 23rd, 1899 until January 1st, 1900, amounted to 4,000.

Q. Now do you know in what vessel those samples were taken; what kind of a vessel?

A. January 1st, 1901, all samples were collected by a collecting machine in bottles with glass stoppers.

Q. Were these bottles made especially for this purpose?

A. No, but the glass stoppers were all re-ground so that we would have an absolutely tight fit. They were specially reground before they were used.

Q. What was done with the bottles after the water was put into them?

A. Well, those bottles were numbered.

Q. Did you give any instructions to the people that took them?

A. Yes sir.

1050 Q. Was this work all done under your direction?

A. Yes sir.

Q. Were those instructions in writing?

A. Not during that period.

Q. Well, what were your instructions, doctor?

A. They were personal, verbal instructions that I gave to every collector, carefully designating how the samples should be taken; how the bottles should be sealed, and how they should be shipped, at what time, so that we would receive them as soon as possible after collection, and so forth.

Q. Well, what did you say to them. You say you gave them instructions; just tell us what you told them to do?

A. The first instruction was, that they should be careful to observe when they received their bottles, either at the City Laboratory, for those collectors who got their bottles every morning, and took them out to the station and filled them with water and brought them back personally, and to those collectors who were stationed at the various collection stations along the entire route from Chicago to St. Louis, the instructions were always to look that the bottle was clean; that if their personal inspection should notice anything in the bottle, that wasn't clean, or that the stoppers,—the glass stoppers didn't fit, so that there was a possibility of the water not being closed as air-tight
1051 as possible under the circumstances, that they should reject the bottle and call my attention to it and demand another bottle and not leave until the person who would give them the bottles,—the janitor,—until they had received the

proper bottle. Then that they should be careful when they used the machine, that the stopper was attached to the machine, the glass stopper, in such a way that the bottle could easily be closed. Then furthermore, that they should note on the tags that they attached to the bottle, they should note several things that were represented there in printed questions, the number of the bottle—

Q. When were they to be attached?

A. They were to be attached when they took the samples of water.

Q. Well, immediately, or an hour afterwards?

A. No, they were to be taken as soon as possible after they had filled the bottle, to put the tag on right away, and to seal it right there. They were to have sealing wax in their possession and were to have each one a seal, a numbered seal. I haven't got one here, but it is an ordinary stamp seal with the engraving "City Chemist's Office" and the number—giving the number of the collector.

Q. Stamping the number of the collector on the wax?

A. Stamping the number of the collector on the wax, yes.
1052 Now for instance the collector at Alton, I would say, might have seal No. 4, so that the seal would be numbered 4, and then not to deliver any bottle to the express office, —or if he brought the bottle to the City Chemist's office, not to carry it without having it sealed in such a way so that I would be absolutely certain that the bottle could not be opened en route from the collection point to the City Chemist's laboratory, and when the chemist would analyze each sample, he would have to open it.

Q. Now what did you instruct these water collectors to put on the card that they attached, or the tag,—to each bottle?

A. They were to put on their name—

Q. Well, whose name?

A. The name of the collector, the time and the hour of the collection exactly.

Q. What time?

A. By the minute, and the date of the collection.

Q. Day of the month?

A. Day of the month; they were to take the temperature—that is, that was optional with them, to take the temperature of the air and take the temperature of the water. For that purpose they all were provided with a thermometer which had been tested in the City Chemist's laboratory for its accuracy
1053 a thermometer that they would carry with them for the purpose of ascertaining the temperature of the water when taking the sample and the temperature of the atmosphere.

Q. And if they did take the temperature of the air and the water, that was to be placed on the card?

A. On the card, yes.

Q. Well now, do you know that these collections were made at these various places,—of the water?

A. Yes sir.

Q. And they were all made in bottles, were they?

A. Yes sir.

Q. Now where were they instructed to send those bottles, and how did they send them after they collected them—just take the various points there and tell how they sent them?

A. Well now, they had certain wooden boxes that were furnished us by the Water Department of St. Louis during this part of the investigation, and these boxes were to be carefully packed—the bottles were to be carefully packed into these boxes for the earlier part of the period, up to about May 1st, these bottles were simply put in the boxes and surrounded with excelsior,—what they call excelsior packing material.

Q. How many in a box?

A. Well, that depended upon the number of samples taken. Usually there were taken from January 23rd on, duplicate
1054 samples. That is, on January 23rd began a duplicate chemical investigation of samples of water taken from these points, in the laboratory of the Washington University, under the supervision of Professor Edward H. Kiser. Every collector was instructed every time that he would collect samples to collect at least two bottles, each one sealed in the proper way, as explained, and these bottles to be delivered at the City Chemist's laboratory, and to the clerk who had charge of that work, —that is to receive and enter those bottles. After that I and

my assistant, the Assistant City Chemist, found that our time was too valuable to receive those bottles, and enter them ourselves on the record books,—what I call the register of the sample, up to that time. After that we had a special clerk for that, who attended to that work.

Q. Under your supervision?

A. Yes sir, under my supervision and responsible to me.

Q. How much water did these bottles contain?

A. Originally we had half gallon bottles.

Q. During this period?

A. Yes, because we could not obtain the larger sized bottles, and for several months we were confined to what we call five pint bottles, and four pint bottles.

Q. Have you got one of those there?

A. Yes sir.

1055 Q. Well, just put it up there and we will offer it as an exhibit.

A. This is one of the four pint bottles (indicating). That is a half gallon (indicating).

Q. That is what you used in the earlier part of 1900?

A. In addition to these bottles—we were unable to obtain a sufficient number of bottles to supply our demands of those kinds here,—the white bottles—

Q. Well, the four pint bottle?

A. The four pint bottle, and we used the five pint bottles for a certain period until—I don't recollect exactly when that was—until we received a large assortment of the gallon bottles and used those. The machine was so constructed that we could easily alter the mechanism so as to put the gallon bottle into the machine. I have the machine here; we have two sizes, but they don't vary much.

Q. They are constructed on the same principle as Exhibit No. 15?

A. Yes sir. This was more adapted for the smaller bottle, but it was finally changed so that we could use the larger bottle on it too.

Q. Well now, have you—

A. I beg you pardon—

Q. What were you going to say?

A. I wanted to say, regarding the packing of these samples in ice, that when the warm weather set in, beginning 1056 with May 1st, 1900, we began to require our collectors to provide themselves with ice at all the stations where they were permanently located, and to pack every sample in ice when they would ship them to St. Louis, and those collectors who received their bottles every morning in St. Louis and went out to the Chain of Rocks, or to Alton, to Hartford or Bellefontaine, those collectors received the ice at the City Chemist's office, and packed their bottles in ice from the beginning, and took them to the stations. That is for a time, for a part of the period, the collectors at Alton and at Hartford would buy their ice there, but the other collectors took the ice from the City Chemist's office and took the samples along in that way, or at the Chain of Rocks for a time,—the period I don't recollect, they were provided with ice, but the object was attained throughout the entire route of the stations everywhere during that summer, the samples were packed in ice, and no samples were accepted unless they arrived in a condition that we could see that the ice had not melted entirely and that the water was ice cold. That was beginning with May 1st, and while we didn't begin the packing of the samples in ice at every station on May 1st, it was practically accomplished throughout those spring months.

Q. Well how about the summer months; was that continued throughout the summer months? 1057

A. All throughout the summer months.

Q. And up to what period?

A. That was continued up to the time of the cessation of the collection of samples outside of St. Louis.

Q. On what date?

A. On October 12th, for the daily samples and for the weekly samples, and for the semi-weekly collections on November 30th. This period of investigation from January 23rd, 1900, to October 12th, 1900, really covered a period of daily collection of samples from all these points, with the exception of a number of samples taken from Lake Michigan and from a few points near Peoria. But the principal object was a daily collection of samples from these points. October 12th this daily collection of samples outside of St. Louis ceased, and we only collected weekly or semi-weekly samples after that period.

Q. Until what time?

A. Until November 30th.

Q. 1900?

A. 1900. After November 30th, no more samples were collected outside of St. Louis until October, 1901, at another period of the investigation which I have not reached yet.

Q. Now then, do you know whether or not each and every 1058 one of those bottles thus packed and shipped in ice during the warm season and without the ice in the cold season as you have described, when it was not necessary to pack them in ice—were received at the laboratory of the City Chemist's office in the City of St. Louis, Missouri, with tags attached thereto?

A. Yes sir.

Q. Have you got each and every one of those tags?

A. Yes sir. Now I will not say every one of them, because a small number of them here and there, breaking the consecutive number are missing—that is, in the removal from the Old City Chemist's office quarters to the new quarters last summer a few of these were lost, I will admit that.

Q. Well, how many of them?

A. Well, I don't think that they would exceed 100 tags. I have not counted them, but I don't think they would exceed 100 tags.

Q. And how many tags were there altogether?

A. Well, this investigation has been practically continued until the present day, although the data to be presented in this litigation—

Q. Well, but tell me how many tags there were?

A. I will tell you, because it depends upon when we shall terminate the data to be presented to this Court—

Q. I don't care when you terminate it. How many tags 1059 have you got here?

A. Well, I presume we have analyzed 8,500 samples—

Q. Well, have you got 8,500 tags, less what you lost? That is what I want you to answer yes or no to.

A. I have not seen all the tags, I couldn't say positively, but I gave orders this morning at my laboratory to turn all the tags that we had over to yourself this afternoon.

Q. What do you know about those tags? Have you got any idea of about how many you have got?

A. As I say, I have not had the time this forenoon to identify them sufficiently so as to say that there are 8,000 here. But I gave orders to present 8,500.

Q. Oh well, estimate them. How many have you got there do you think?

A. Well,I can't honestly estimate them, because I have not gone over them to see how many have been delivered.

JUDGE SPRINGER Just give your opinion?

A. Well I expect 8,500 tags to be included in this bunch.

ATTORNEY GENERAL CROW: Less what were lost last summer?

A. I mean deducting perhaps 100 that have been lost last summer.

Q. Well that is what I say, less what were lost last summer?

A. Yes sir, that would be 8,400, yes sir.

1060 Q. Well, did those tags have any numbers on them?

A. Yes, everyone.

Q. What did those numbers represent?

A. These numbers represent every one, one bottle of water analyzed in the City Chemist's office, and for such parts of the investigation where duplicate work was performed by Professor Kiser of the Washington University it represents also a duplicate bottle of water analyzed by Professor Kiser and his assistants.

Q. Well now, to get back to the original question that I asked you; do those numbers correspond with numbers anywhere else, the numbers on the tags?

A. Beginning with Number 148, those numbers all correspond to an official register of the samples of water, which was kept at the City Chemist's office in which was registered every—

Q. What is the date of the beginning of number 148?

A. Tuesday, January 23rd, 1900.

Q. Then it is at the beginning of the second period?

A. Yes sir, until the present day; every sample of water collected and analyzed—that is every sample.

Q. Now don't get off—the number of the tags corresponds then to the records that you have entered on the book there,

ATTORNEY GENERAL CROW: Now, Judge, I want to
1061 just have those books considered in evidence. You can
consider them in the record too, so that if you want to refer to them for any specific purpose, it can be done. I don't think it will be necessary. I don't want them.

JUDGE SPRINGER: It is agreed that these books are to be considered in evidence, but not to be printed. Any of the counsel for either side may examine them at any time when they see fit.

(The books are before the commissioner at this time, but were retained by witness. F. S. B., Com'r.)

Q. ATTORNEY GENERAL CROW: Now these books contain what?

A. These books contain the official register of the City Chemist's office, of all samples of water beginning with sample No. 148, until the present date, which have been collected from the—

Q. Wait now; you can explain that briefer than that. Here is what I mean: Don't the entries in the record correspond with the memorandum on the tags?

A. Yes sir.

Q. Well, that tells the whole story—that is what that is a record of then?

A. Yes, but in addition to what is contained on the tags, this register also states in every case that whenever duplicate sample was turned over to Professor Kiser—or a bacteriological
sample had been collected at the same time by that col-
1062 lector, that the duplicate chemical sample was turned
over to Professor Kiser and that the bacteriological sample was turned over to the bacteriologist. That is the additional information that this official register of samples contains, which is not stated on the tags.

ATTORNEY GENERAL CROW: Now I think he has explained what is in that book sufficiently. Now that agreement there, Judge, you had probably better change the phraseology of that so as to show that they are in evidence.

It is agreed that tag Exhibit No. 17, is a sample of all these tags.

It is agreed between counsel that these tags referred to, numbering in the neighborhood of 8,000, and a representative sample of which has been introduced in evidence and marked Complainant's Exhibit No. 17, shall all be considered as evidence offered in the case by the complainant, but the same need not be printed in the record of the evidence of either side, but counsel on either side may refer to any or all said tags, or any memorandums thereon for any purposes whatever. F. S. B., Com'r.

JUDGE SPRINGER: That is satisfactory.

ATTORNEY GENERAL CROW: Now I think we will put in these bottles.

Three of said bottles received in evidence and marked
1063 by the Commissioner respectively "Complainant's Exhibit
18, 19 and 20. Frank S. Bright, Commissioner."

Q. Now you have got another period there?

A. Yes sir, there are five periods of investigation altogether.

Q. Well go ahead with the others.

JUDGE SPRINGER: What were these periods?

A. This was the first and second period.

ATTORNEY GENERAL CROW: Before we go any further we might just as well state that those tags just put in evidence will cover all the periods.

THE WITNESS: Yes sir.

ATTORNEY GENERAL CROW: We can let the record show that, Judge.

JUDGE SPRINGER: Yes.

Q. ATTORNEY GENERAL CROW: Now then, go ahead with the next period.

A. The next period, I haven't got my report here; that is up in your room.

Q. Well, go down there and get it.

A. That was the report that was presented for last November to you. It is in Mr. Jeffries' room. I would need that in order to get the corect data of the investigation.

MR. JEFFRIES: What is that?

1064 A. That is the supplemental report, presented last November.

(Witness procures the report refered to).

Q. ATTORNEY GENERAL CROW: Just go on doctor, with your next period. Now this is the third period.

JUDGE SPRINGER: Just give the date.

Q. ATTORNEY GENERAL CROW: Go ahead, doctor, and give the dates now, that you commenced—

A. This is the third investigation, the date particularly as far as the collection of samples at the Chain of Rocks is concerned, was from October 12th, 1900, to September 30, 1901. During this period of collection analysis of samples was confined to such as were taken from the Mississippi River at the Chain of Rocks daily, from the following points:

Illinois shore,
Missouri shore,
Intake tower.

In addition thereto, one daily sample was taken—

Q. Wait a minute, that kind of location put into the record wouldn't convey anything to a man's mind that didn't understand the location. What you mean to say when you say Illinois shore, is that it was taken at points opposite the Intake tower, on the Illinois shore, in the Mississippi River?

A. Yes sir.

Q. Well, just say that?

1065 A. At the chain of rocks—

Q. Leave out the Chain of Rocks, just say at the Intake Tower: Everybody understands that in this record.

A. Yes sir.

Q. Then another sample was taken from the Missouri shore?

A. One sample was taken near the Intake tower and one was taken opposite the Intake tower from the Illinos shore, and another sample was taken from the Missouri shore, Intake tower.

Q. How often were those samples taken?

A. Also every day a sample was taken from the outlet chamber of the St. Louis Waterworks, that is after the water enters the Intake and passes through the tunnel or distributing well, and from there it goes into the reservoirs and after it leaves the reservoirs it passes through the chamber which is called the Outlet Chamber, and from there is sent through the mains of the city water supply.

Q. And were those samples taken daily?

A. And from the tap of the City Chemist's office,—every day, yes sir.

Q. During that period of time mentioned?

A. Yes sir.

Q. From what time to what time?

A. From October 12, 1900 to September 30, 1901.

1066 Q. Now, who took these samples?

A. Those samples were collected by collector Charles F. Werner.

Q. Were they collected in a manner similar to what you have heretofore described?

A. Yes, sir, according to similar instructions, as described previously.

Q. Well, were they taken from the current of the stream? How far from the shore were those, on the Illinois and Missouri shores taken?

A. Well, they were taken as close to the Illinois shore and as close to the Missouri shore as in the judgment of this collector was necessary in order to get the characteristic water flowing at the shores, and also to get at the Intake tower which is located at the edge of the channel, to get the water from the edge of the channel just as it flows into the Intake.

Q. Did you give this collector any instructions?

A. Yes, sir, personal instructions.

Q. Well, what were the instructions you gave him?

A. The instructions were—shall I describe—

JUDGE SPRINGER : Were they the same as they were before?

A. Yes, sir.

1067 Q. ATTORNEY-GENERAL CROW: Well, just say they were the same as given before.

A. The same as before.

Q. As given to the other collectors heretofore mentioned?

A. Yes, sir.

Q. Now, what was done with these bottles after they were taken from the water?

A. After they were taken from the water, this collector brought them down to the city chemist's office every day.

Q. Brought them himself?

A. Yes, sir, carried them down every day.

Q. Now, during the warm season did they come with ice, or without ice?

A. They came with ice.

Q. With ice?

A. Yes, sir, they came with ice all the time during this entire period; they were packed in ice at the Chain of Rocks.

Q. Well, was there any record entries made of those bottles when they arrived at the laboratory?

A. Yes, sir.

Q. Of the city chemist's office?

A. Yes, sir.

Q. Who made that record?

1068 A. The record was made by myself or my assistant, Mr. Buckland, and by a clerk who officiates in the city chemist's office.

Q. Well, you know that that record was made?

A. Yes, sir.

Q. It was kept in the books heretofore introduced in evidence?

A. Yes, sir, in the register of samples.

Q. Now, was there anything put on those bottles when they were sent down?

A. Yes, they were covered—that is the stopper and the neck were covered with a piece of muslin, around which string was tied, and a tag was attached in the manner and form previously described, and sealing wax was applied to the string and the muslin so that they could not be disconnected in any way from the bottle, and a seal pressed on the sealing wax every time a bottle of water was collected in that manner by the collector.

Q. Were the bottles numbered?

A. Yes, sir.

Q. Was there any numbers on the tags?

A. Yes, sir.

Q. Was there any correspondence between the numbers on the bottles and the numbers on the tags?

A. No, sir; the number on the tag is to correspond with the number of this glass stopper. The object of this cor-
1069 respondence of the two numbers is that in cleaning the bottles, sometimes the stoppers would get changed and they would not fit so tight, and it was my earnest desire to obtain samples only that had been collected in bottles where the glass stopper was as tight as possible—air tight as could be, and every one of those stoppers was reground when the bottle was sold to the City, so that we were anxious to have the same stopper on the same bottle, so strings were tied to them and they were tied—the stopper was tied to the bottle that way; but the consecutive number of samples of water collected for this investigation was entered on the official register every time a sample was brought in by Mr. Woerner.

Q. Well, did the numbers on the tags correspond to the number of the entry in the books heretofore introduced in evidence, and in which is recorded a record of the bottles?

A. Yes, sir.

Q. Now, what was on the tags?

A. On the tags was the name of the collector, the date and the time of collection. There was also given the temperatures and place where the sample was collected from.

Q. Well, you have got those tags here?

A. Yes, sir.

1070 Q. They are part of the tags heretofore introduced in evidence?

A. Yes, sir, they are all here today.

Q. Now, go to your next period?

A. The next period was the investigation from October 1st 1901, to November 30th, 1901. This was the most extensive period, or the period of the most extensive investigation connected with this litigation.

Q. Well, was it a daily collection of samples?

A. It was principally a daily collection of samples with the exception that at some points, cross-sections were taken and for special scientific reasons connected with the investigation samples at random had to be taken, but not consecutively every day, from day to day, but there was from a large number of points during this two months, daily samples were collected.

Q. Well, now, what points were they?

A. Chicago, Illinois & Michigan Canal at Bridgeport.

Chicago Drainage Canal at Bridgeport.

Lockport, Chicago Drainage Canal, Bear Trap Dam.

Lockport, Illinois & Michigan Canal.

Des Plaines River above Bear Trap Dam at Lockport.

Des Plaines River at Ninth Street Bridge, Lockport.

1071 Des Plaines River at Ruby Street Bridge, Joliet.

Des Plaines River at Brandon's Bridge, Joliet.

Illinois River at LaSalle, Illinois.

Illinois River at Peoria, Illinois, three miles above the railroad bridge.

Illinois River at Pekin, Illinois.

Illinois River at Kingston, Illinois, eight miles below Pekin.

Illinois River at Beardstown, Illinois.

Illinois River at Grafton, Illinois.

Mississippi River at Grafton, Illinois.

Mississippi River at Alton, Illinois.

Mississippi River at Hartford, Illinois.

Mississippi River at Chain of Rocks, St. Louis, Illinois shore.

Mississippi River, Chain of Rocks, St. Louis, midstream.

Mississippi River at Chain of Rocks, St. Louis, Intake of Waterworks.

Mississippi River at Chain of Rocks, St. Louis, Missouri shore.

Missouri River at Fort Bellefontaine.

St. Louis Waterworks at outlet screen or outlet chamber.

1072 St. Louis Waterworks, from tap in city chemist's office.

Those were daily collections.

Tri-weekly samples were collected from Lake Michigan at Chicago during this period.

Q. Have you given the period to the stenographers?

A. Yes, this is the fourth period of investigation, from October 1st, 1901, to November 30th, 1901. As I said before, the most comprehensive investigation—

JUDGE SPRINGER: That is one month?

A. Two months, October 1st, 1901, to November 30th, 1901. As I said, tri-weekly samples were collected from Lake Michigan at Chicago; semi-weekly samples were taken from the south branch of the Chicago River at a point near the Chicago & Alton Railroad bridge; also at Wesley, Illinois, left, right and center section of the Illinois River.

JUDGE SPRINGER: Where is Wesley located? Locate that. I know where it is, but the record doesn't show it?

A. Wesley is south of Peoria.

Q. South of Peoria, how far?

A. Three miles. Between Peoria and Pekin, yes, it is south of Peoria about three or four miles.

Four samples were collected during this period from the Missouri River at Omaha, above and below the City of Omaha.

1073 Four samples from the Missouri River at Kansas City, above and below the city.

Four samples were collected from the Missouri River at Jefferson City, above and below the city.

Four samples from the Missouri River at Hermann, Missouri, above and below the city.

Four samples from the Missouri River at St. Charles, Missouri, above and below the city.

Two samples were collected from the Missouri River at Wathena, Kansas.

Two from the Missouri River at St. Joseph, Missouri.

Two samples from the Kaw River, near Argentine, Kansas.

During this period occasional cross-sections of samples were taken at various points. These cross-sections at a certain point —I will say at Alton, for instance, right across the river, at equal distances between the various points from twelve points across that river. Samples were taken ten or twelve points, or more, just according to the requirements. Cross-sections of such samples were taken at Pekin Bridge, Illinois River, at Kingston, Illinois River at Peoria, Illinois River. At Joliet, Des Plaines River,

At Alton, Mississippi River,

At Chain of Rocks, Mississippi River,

1074 At Hartford, Mississippi River,

At Chain of Rocks, Mississippi River, St. Louis Waterworks, and at Fort Bellefontaine, Missouri River.

During this period the daily collections at Grafton were extended. To December 1st, or November 30th, all the daily collections outside of St. Louis ceased. We still continued the daily collections at Grafton, until December 18th.

Q. ATTORNEY-GENERAL CROW: Now, that is the only places you made collections at during this period—those are the only places?

A. Yes, sir.

Q. These collections were made in bottles, were they?

A. Yes, sir.

Q. And made under your supervision?

A. Yes, sir.

Q. And how were they shipped to you? Just tell it in a general way; don't go into the details?

A. Now, a certain number of the samples that were collected at Fort Bellefontaine, at Alton and Hartford, those samples were carried by the collectors from those points of collection to the City Chemist's laboratory; they were collected in the morning and delivered to the City Chemist's office at noon time for analysis, on the same day. The samples at all 1075 the other points between Grafton and Chicago were shipped by express from those points to St. Louis by collectors that were stationed at those points.

Q. Well, were they packed in ice or otherwise?

A. All of them were packed in ice, and all the samples brought to the laboratory by the collectors from the points at Fort Bellefontaine, Hartford, Illinois, and Alton were brought packed in ice, and the same applies to the samples collected at the Chain of Rocks; they were also packed in ice.

Q. No use repeating that. How about the Missouri River points, were they all packed in ice too?

A. Yes, they were all packed in ice too.

Q. They were all taken under your supervision?

A. Yes, sir.

Q. Was there anything put on those bottles?

A. Yes, sir.

Q. What was it?

A. There were tags attached to the bottles, and the bottles were properly sealed, and the tags were sealed onto the muslin cover of the stoppers in the same manner as described heretofore.

Q. The bottles were all received at the laboratory of the City Chemist's office in the City of St. Louis?

1076 A. Yes, sir.

Q. You know that?

A. Yes, sir.

Q. And they all bore these tags?

A. Yes, sir.

Q. Was there a record made of these bottles?

A. Yes, sir.

Q. Where is that record?

A. The record is contained in the Register—Official Register of Samples.

Q. Heretofore introduced in evidence?

A. Yes, sir.

Q. Now, have you got those tags?

A. Yes, sir.

Q. Where are those tags?

A. They are in the bunch that was presented today.

Q. That was offered in evidence heretofore?

A. Yes, sir.

Q. Now, what is your next period?

A. This period extended properly from December 1st, 1901, to July 1st, 1902, and represents a daily collection of samples by collector Charles F. Woerner, from the Mississippi River at the Intake Tower of the Waterworks, and from the Missouri and Illinois shores, opposite, or from the Mississippi near 1077 the Illinois and Missouri shores opposite the Intake tower, and also from the outlet chamber of the St. Louis Waterworks, and from the tap in the City Chemist's office.

Q. Well, these were all taken under your supervision?

A. Yes, sir.

Q. Done under the same method, and in bottles, as heretofore described for the other periods of time?

A. Exactly.

Q. How were they shipped?

A. They were collected early in the morning by collector Woerner and they were brought to the laboratory at noon time on that same day.

Q. By whom?

A. By Woerner personally.

Q. Personally?

A. Yes, sir, every day, including every holiday.

Q. Was the bottle sealed?

A. Yes, sir.

Q. In the manner you have heretofore described?

A. Yes, sir.

Q. Were they tagged?

A. Yes, sir.

Q. In the same manner as heretofore described for the other periods during which you received bottles?

1078 A. Yes, sir.

Q. Have you got those tags?

A. Yes, sir.

Q. They are part of the tags heretofore introduced in evidence?

A. Yes, sir.

Q. Have you got a record of the tags?

A. They are all entered on the Register of samples.

Q. These books already introduced in evidence?

A. Yes, sir.

Q. Now, those are all the periods of time during which you have had samples collected?

A. I had samples collected from July 1st to January 1st, but I will not present those in evidence.

Q. Have you got a record of them?

A. I have got a record of them and they are included in the official register there, presented today.

Q. You mean July 1st, 1902?

A. Yes, sir, July 1st, 1902.

Q. Well, have you got the tags?

A. Yes, sir.

Q. Where are the tags?

A. The tags are included here in the bunch that was presented today.

Q. Well, were these various bottles, for all these five
1079 periods, were they all examined chemically in that laboratory that you had charge of?

A. Yes, sir, except the duplicate samples that were sent to Professor Kiser during those periods.

Q. Well, who did the examination of this work?

A. The examination was made by a corps of assistants—

Q. Well, was it done under your supervision?

A. Yes, sir, all of it.

Q. Well, you kept a record of that?

A. Yes, sir.

Q. And those are the samples that constitute your record of the chemical analyses of these various waters?

A. Yes, sir.

Q. That have been mentioned?

A. Yes, sir.

Q. Have you got a list of the men that collected these water samples for you?

A. Yes, sir.

Q. And they all worked under your instructions?

A. Yes, sir.

CROSS-EXAMINATION, by Judge Springer.

Q. Were any of these samples to which you have referred during these five periods used for bacteriological examinations?

A. No, sir, not the samples of water collected in the
1080 bottles as described today.

Q. These were only used for chemical analyses?

A. Yes, sir.

Q. You spoke about having collected during these various periods something like 8,000 samples?

A. Yes sir.

Q. Did you superintend the analysis of those 8,000 samples yourself?

A. Well, I superintended them in so far as that the analyses were in—they were not performed by myself, or parts of the analyses not performed by myself; they were performed by my assistants under directions and instructions presented by me.

JUDGE SPRINGER: The manner of making these analyses will properly belong to the next time this witness is introduced, I presume, General?

A. ATTORNEY GENERAL CROW: Oh yes, I didn't go into that at all.

JUDGE SPRINGER: I will not ask him anything about that then. That is all.

Q. JUDGE SPRINGER: I will ask the professor one question. Did you indicate the places near the Chain of Rocks at which the samples should be taken?

A. Yes sir.

Q. How far was the first place at which samples were to 1081 be taken from the Missouri shore—I mean the State of Missouri shore?

A. You mean the point of collection?

Q. Yes.

A. From the Missouri shore?

Q. Yes.

A. Well, that was—

Q. Chain of Rocks?

A. That was supposed to be anywhere from 25, to fifty or seventy-five yards. It is impossible to designate a particular point there on account of the current, but the general instruction was that the collector was to get a sample from the Missouri River current, which is generally supposed to hug the Missouri shore very closely, to get a sample of that current.

Q. Now what were your instructions with regard to the point on the opposite shore or, the Illinois shore?

A. Exactly the same, only applied to the general supposition of a certain current hugging the Illinois shore there.

Q. How far was that point from the land, from the shore on the Illinois side?

A. Well now, that varies very much according to the 1082 point taken at the shore, and it has to be left to the judgment of the collector largely.

Q. What were your instructions in regard to it at that particular point?

A. Well they were to get water that was close to the Illinois shore, a certain current there with which the collector would very soon become familiar after entering upon his duties.

Q. Was there any distinction at that point between water which it was supposed by you or your collectors to come from the Mississippi River proper, or from the Illinois River in part —in other words, had the Illinois and Mississippi waters commingled at that point so that they could not be designated or separated from each other by the eye?

A. Well we could only determine by the chemical analysis,—that is, the results of the chemical analysis would demonstrate that.

Q. I thought you were speaking of physical conditions, of the commingling of the various waters here?

A. No, I was only referring to a current always existing there close to the Illinois shore, and that from that current the samples were to be taken. What kind of water that is of course only chemical analysis could determine.

Q. Well, wouldn't that chemical analysis tell whether that
1083 water came from the Illinois River or the Mississippi River proper, above the Illinois River?

A. Well, that would depend entirely upon conditions of mixtures prevailing at certain times, and which vary very considerably. It is hardly possible to make a direct assertion there which would be a condition applicable for all times. It varies very much.

Q. Have you visited the point of confluence of the Illinois River with the Mississippi River?

A. Yes sir, quite a number of times I have been up there.

Q. In ordinary stages of water, what would be the relative volume of water from each of those streams?

A. Well now that depends again upon the volume of water coming down those watersheds. It varies very much.

Q. The volume of water depends upon the amount of water that is coming down I suppose?

A. Well, you wanted to have an approximation, which is difficult to give.

Q. Well, I ask you if you could state the relative amount, or the proportionate amount of water which came together there from the respective streams, how much of the volume was contributed by the Missouri River and how much by the Illinois River?

A. You mean at the confluence of the two rivers?

1084 Q. Yes sir.

A. At Grafton?

Q. Yes.

A. Well now, I don't think that any fair average can be drawn there, because it varies so much at times.

Q. I spoke of the ordinary condition or stage of the rivers.

A. Well, one never is sure.

Q. The Mississippi River is much larger than the Illinois River, that is certain.

A. The Mississippi River is larger. There is always a swifter current in the Mississippi River. The average rate of flow of the Mississippi River is larger than that of the Illinois river. Those are general facts which—

Q. Then from your personal—from the appearance of the two streams, you couldn't state what would be the difference between the volume of water carried by one as compared with the other. You couldn't state that?

A. No, not from my own personal observation, that is right.

RE-DIRECT EXAMINATION,

By Attorney General Crow.

Q. You stated in answer to one of Judge Springer's questions that there were no bacteriological collections of water made, that is to say, water for the purposes of bacteriological examination during the five periods that you mentioned. Did you mean to testify to that? 1085

A. No, I meant to say that I didn't collect any bacteriological samples.

JUDGE SPRINGER: My question was confined to the samples that he took himself; not to any other.

THE WITNESS: I didn't take any bacteriological samples. I took quite a number of samples myself in 1899.

ATTORNEY GENERAL CROW: There were also bacteriological samples collected by those various collectors a good deal of the time during these five periods?

A. Yes sir.

Q. And these samples were sent along with the chemical samples to you?

A. Yes sir.

Q. In the same manner and at the same time and received at the same place that you received the chemical samples?

A. Yes sir.

RE-CROSS EXAMINATION,

By Judge Springer.

Q. Well do these tags represent the bacteriological samples as well as the chemical?

1086 A. The collector that collected the two kinds of samples delivered them at the City Chemist's office and they were—they were numbered in the consecutive order of the official register and this number was also placed on the tag from the bacteriological bottle.

Q. The same number?

A. Yes sir, the same number.

Q. So that the numbers then would be duplicate?

A. Yes sir.

Q. In case one sample was to be used for bacteriological purposes and the other for chemical—

A. Yes, that is the same number was placed on the tag for the bacteriological bottle, and the bottle turned over to the bacteriologist. This had that same number on that was copied in the official register, but whether he followed a different numbering, that of course I can't tell. It is my impression that that was done; that they had separate numbering.

ATTORNEY GENERAL CROW: Well do you know what was done with these bacteriological water samples after they were sent to your office?

A. They were—

Q. Where were they sent to?

A. They were sent to the bacteriologist, who had charge of that work. For a time they were sent to the St. Louis

1087 Medical College where Dr. Ravold and his assistants, who had charge of the bacteriological work performed their work.

Q. Was that done under your supervision—I mean were those bottles sent up there under your supervision?

A. Yes sir.

Q. By employes in your office?

A. Yes sir. Then for a certain period of this entire investigation bacteriological work was performed in the Old City Hall in certain quarters, and the samples were sent over there then.

JUDGE SPRINGER: Were all the chemical analyses made of these various waters to which you have referred, made in the City of St. Louis?

A. Yes, all made in St. Louis. The work conducted in the City Chemist's office under my supervision, as well as the separate chemical work performed in the laboratory of the Washington University under the supervision and responsibility of Professor Kiser.

ATTORNEY GENERAL CROW: Now Judge, we will just let the record show that he is withdrawn for the present after having given this preliminary testimony.

JUDGE SPRINGER: Witness withdrawn for the present and to be introduced later for the purpose of explaining his chemical analyses, is that right?

ATTORNEY GENERAL CROW: Yes, of continuing his testimony.

WILLIAM C. TEICHMANN.

1088 CHARLES F. WERNER,

called as a witness on behalf of the plaintiff, now being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION

By Attorney General Crow.

Q. What is your name?

A. Charles F. Werner.

Q. You live in St. Louis, Mr. Werner?

A. Yes sir.

Q. Were you employed by Dr. Teichmann to collect water samples?

A. Yes sir.

Q. From what points, in what streams did you collect samples?

A. I collected water at Joliet.

Q. Sir?

A. I collected water at Joliet.

Q. Out of the Illinois River?

A. Out of the Illinois River.

Q. Where else?

A. Lockport, at the Bear Trap Dam.

Q. At what period of time did you make that collection?

A. That was in 1900.

Q. 1900?

A. But what date I could not say.

Q. Did you collect water at any other place?

1089 A. Yes, sir I collected water at Peoria, Illinois, that is, three miles above Peoria.

Q. At any other point?

A. At Chain of Rocks.

Q. At Peoria you collected in the Illinois River?

A. At Peoria I collected in the Illinois River, yes sir.

Q. Three miles above Peoria in the Illinois River?

A. Yes sir, I collected three miles above Peoria. Peoria is where I was stationed at.

Q. At the Chain of Rocks what river did you collect in?

A. Mississippi River, Illinois shore; Missouri Shore and In-take Tower.

Q. Do you remember when you began work?

A. Well, 1900, I believe. It was in March, if I am not mistaken, the latter part of March, if I am not mistaken.

Q. Did you work continuously?

A. Yes, sir.

Q. When did you quit?

A. I think January, 1903.

Q. January, 1903?

A. Yes, sir.

Q. And you have been collecting water continuously for Doctor Teichmann?

A. Yes. sir.

Q. Up to January, 1903?

A. Yes sir.

1090 Q. Now, any other place besides these you mention that you collected water?

A. Well, occasionally I would go up to Hartford.

Q. Hartford, Illinois?

A. Yes sir. I went up there two or three times, that I went up there.

Q. Where did you collect water from there?

A. I collected right in the channel of the Illinois.

Q. Where?

A. At Hartford, Illinois.

Q. Now, what did you collect this water in, bottles?

A. I collected that water in these gallon bottles (indicating).

Q. Collected it on the surface of the water or underneath?

A. No, sir, two and a half to three feet about as far as I could reach the machine down. I had it corked. I placed the machine down under water, then when I would get it down as far as I could, if the current was not too strong, I would push up the cork and let the water in and when I thought it was full I would cork it and raise it up.

Q. Were these samples taken out in the stream each time?

A. Every time.

Q. What did you seal the bottle with?

A. I would take a cloth and wrap it up around the bottle and tie it down, tie it with string or twine, and take sealing wax and seal it up, heating it up and then I would 1091 take my sealer and press down on it, and that would answer the purpose for the city chemist of St. Louis. Well, I don't know which I had, I had a number and I think I had number five sealer.

Q. Now, did you put any tag on the bottle?

A. Yes, sir, I put a tag on there, put on the date that I collected the water.

Q. Put that on the tag?

A. Yes, sir, put that on the tag and the hour I collected and the notation where I collected the water, the temperature of the air and the temperature of the water and my name on every tag.

Q. Now, when you collected at any other place than the In-take Tower at the Chain of Rocks, or opposite the In-take Tower on the Illinois shore of the Mississippi River or at Bellefontaine, did you ship the bottles?

A. Well, at Chain of Rocks, no, or either at Hartford, I never did. I carried them home in my own hands.

Q. Well, you did not carry them from Joliet?

A. No, no, I shipped them from there.

Q. Now, from what places did you bring them in personally to the laboratory?

A. Well, from Hartford.

Q. From Hartford, Illinois?

A. Yes, and from Chain of Rocks and I have been twice,
1092 two or three times, that I have been up at Bellefontaine.
I carried them from there. That is to the train and had them in my possission in front of me so they wouldn't get out of my reach, and I took them right to the City Chemist's; take them out of the cans and place them on the table, and have one of the chemists to know it, or Dr. Teichmann, and they would number that and start to work on it. If they wouldn't work on them right away, they would lay them right in ice boxes.

Q. Were these bottles packed in ice at any time?

A. In the warm spells they were.

Q. When you collected up the Illinois River, Bear Trap Dam, etc., how did you get them down here then?

A. I collected the water and placed them back into the boxes; there was a tin box, kind of a refrigerator we called it, packed with ice and then on the sides of it to keep it from warming, we packed excelsior, and the bottles were placed in the refrigerator to keep them cold. I sealed the boxes with a wire seal and then put the tag on with string,—with twine and sealed that with wax the same way as I did with the sealer, with the lead seal, and sealed it right on the box, on the lid, so in case she was opened up, or that they wasn't there, they would know that it was opened up by someone.

1093 Q. Then what did you do with it?

A. I took it to the express office and had it shipped to St. Louis.

Q. Where did you ship it to?

A. To the City Chemist.

Q. Now any other places than those you have mentioned, that you took samples?

A. No sir.

Q. Were those samples taken daily or weekly by you?

A. Every day.

Q. Every day?

A. Sundays, holidays and every day.

Q. Did you take any bacteriological samples?

A. Yes sir.

Q. During what period did you take them?

A. Well I have taken some of them up at the Bear Trap Dam in 1900.

Q. March, 1900?

A. Well, I wouldn't say for sure whether it was March; it was around that time, anyway, March, February, January, or April.

Q. Did you take any at any other time or place?

A. Yes, I have taken them up at Hartford, Illinois and Peoria, Illinois.

1094 Q. At what times?

A. Well, whenever I would take the big sample I would take the small sample.

Q. Always?

A. All the time.

Q. Did you do that throughout all your collections of water?

A. Yes sir.

Q. Up to what period?

A. Let me see; that was until about 1902, if I ain't mistaken, around December; I ain't right certain,—or November, something like that.

Q. November, 1902?

A. Yes, around November, 1902.

Q. Around November, 1902?

A. Yes sir.

Q. What was the size of the bottles that you took the bacteriological samples in?

A. They were about the size,--about this size; we had an extra machine for that.

Q. Just indicate; state about the size, about how much would they hold?

A. About half a pint, I guess, something similar to it;
I ain't right certain. Those are the machines we used
1095 (Indicating Complainant's Exhibit 15.) I don't know
what they should hold; I ain't got an idea.

ATTORNEY GENERAL CROW: Get it into the record that it was a bottle the same as is in Exhibit 15.

Q. Now what did you do with those samples when you took them?

A. I took them the same as I did the Chemical samples; took them under water—not to get no air, and in case the cork should come off, to put it to one side and not use it. Send it back. I would place the machine in the water about that depth (indicating).

Q. About what depth?

A. About two and one-half feet, is it not?

Q. That is about three feet.

A. I had hold like this and—

Q. Right hand on the top of it, and left hand horizontally on the bottom.

A. Then I would raise this—

MR. JEFFRIES: What do you call that?

A. Well, the trigger, the spring of it, or lever, I call it.

Q. ATTORNEY GENERAL CROW: Well, what did you do with those samples you collected?

A. I would take them and put tinfoil right over them,
1096 I mean I would take them out of the machine and place
a rag around it,—tie the rag around here and seal it up.

Q. Then what did you do with them?

A. Placed them back in the boxes, until I got to pack them away.

Q. Put them in the same box with the Chemical samples?

A. Yes, that is if I was to ship them, yes sir, put them right against the refrigerator to keep them cold.

Q. Well, what you call a refrigerator was a box of ice?

A. Yes sir, with ice.

Q. In which you shipped them?

A. Yes sir.

Q. Then you put these bacteriological samples in there with the chemical bottles?

A. Yes sir.

Q. And then what did you do with them?

A. I shipped them.

Q. Shipped them where?

A. To the City Chemist.

Q. Right with the chemical samples?

A. Yes sir.

Q. In cases where you didn't ship them what did you do with these bacteriological bottles?

I carried them home—carried them down to the City 1097 Chemist's office.

Q. And delivered them at the same place?

A. And delivered them at the same place, only the bacteriological bottles, I turned them over to Dr. Ravold, or either of his assistants.

Q. You did turn them over to Dr. Ravold?

A. I turned them over to him.

Q. At the City Chemist's office?

A. At the City Chemist's office.

CROSS EXAMINATION.

By Judge Springer.

Q. When did you begin your work of taking samples of water for examination?

A. 1900.

Q. What part of the year?

A. Well, say about the latter part of March.

Q. And you continued up to—

A. 1903.

Q. 1903?

A. Yes sir.

Q. Did you take samples for bacteriological examination during this period?

A. Yes sir.

1098 Q. Did you take any samples for bacteriological examination in the Chicago Drainage Canal and the Des Plaines River.

A. Yes.

Q. How?

A. Yes sir.

Q. And in the city of Joliet?

A. Yes sir.

Q. How long a time was it after those samples were taken until they arrived in St. Louis?

A. How long?

Q. Yes.

A. They would arrive either—They would arrive in the evening. I would collect them in the morning, something around half-past seven or eight o'clock was the latest; then as quick as I would have them collected and packed away, put in ice, and put a tag on and sealed it up with the lead seal, and had the box sealed and ready to be shipped, and about twelve, something around twelve o'clock I believe, the train backed in there and they loaded up.

Q. Back in where?

A. Back into the express office, or at the depot.

Q. At Joliet?

A. Yes sir, and they would be on the way to St. Louis—
1099 now what time they arrived, I couldn't swear to. I think
they arrived in the evening or either in the morning.

Q. Next morning?

A. Because they were delivered to the express—they should have been in the City Chemist's office early in the morning. Now whether they were delivered at night or early in the morning, I could not say.

Q. But they were sent by express?

A. Yes sir.

Q. Upon the date on which they were taken?

A. Yes sir, shipped the very same day.

Q. And you think the train left Joliet about twelve o'clock on that day?

A. Something around that time.

Q. That applies to the samples taken in the Drainage Canal and Des Plaines River, and at the City of Joliet itself, too?

A. Yes sir.

Q. Did you take any samples above Peoria, at a place called Shady Beach?

A. Yes sir, that is Averyville.

Q. What did you do with those as far as shipping them is concerned?

A. Shipped those the same way. Took them to the Adams Express Company.

1100 Q. What time in the morning, did you take them?

A. Took them down around half-past seven or eight o'clock.

Q. Then what did you do after taking them at Peoria?

A. Carried them to the express office, and in the warm spells packed them in my cans, packed in ice, then took a street car and rode to the express office, and then I packed them in the shipping box with ice another time and placed my bottles up against it, and packed them with excelsior on the sides to keep them from breaking.

Q. What time would that express package leave the City of Peoria that day?

A. Well, let's see; sometimes one o'clock; sometimes before; sometimes at one; sometimes a little earlier than one.

Q. How?

A. Sometimes at one, and sometimes a little earlier than one.

Q. Do you know what time those were examined in St. Louis?

A. Well that I couldn't state, because I haven't been there then.

Q. You wouldn't get into there that day, I presume?

A. I was stationed right there at Peoria.

1101 Q. I mean they wouldn't get into St. Louis in time to be examined the same day; it would probably be the next morning?

A. That is something I couldn't state for certain.

Q. Now those samples that you took at Grafton, what did you do with those?

A. At Grafton?

Q. At Grafton, Illinois River, mouth of the Illinois River?

A. I guess I did go up there too, I just collected one, I believe one or two samples at Grafton.

Q. How?

A. I believe I only collected one or two samples at Grafton, Illinois. I brought them with me.

Q. Brought them with you?

A. Yes sir.

Q. Did you take any samples at Omaha, Kansas City, or Jefferson City?

A. No sir.

Q. You didn't take those?

A. No sir.

Q. Did you observe strictly the instructions which had been given you in regard to taking these samples, both for chemical analyses and bacteriological examinations?

A. Yes sir.

CHAS. F. WERNER.

1102 DR. W. C. G. KIRCHENER,

Re-called for further direct-examination by Attorney General Crow, testified as follows:

Q. The samples which you received at the laboratory, how did they come there, for bacteriological examination?

A. The bacteriological. Are you referring to what place?

Q. Well, any of the laboratories that you used to work at—where did you get the samples that you analyzed?

A. With the exception of those samples taken at the Chain of Rocks in the first period of examination, in 1899; and with the exception of a few samples taken at the first period of my examination at Joliet, the samples came to me through the collectors.

Q. Well, who did you receive them from?

A. I received them from collectors, or in case they were shipped from other sources, from a person properly designated for that purpose.

Q. What do you mean by that?

A. The samples—those samples that were shipped to the City Chemist's office, and from there were sent either to the medical college or to the old City Hall.

Q. By whom, by some employe?

A. By some employe whose business it was to transport these samples.

1103 Q. Do you know who it was that brought them, usually?

A. I don't know.

Q. At what period of time did you receive any of these samples yourself in the laboratory?

A. At the medical college between the period of January 23rd and May 1st, 1900, the samples were received by myself, or by Dr. Rush, or by an assistant which—who is employed in the laboratory.

Q. What condition were these bottles in when you received them from the collectors, or when you received them at the laboratory, with reference to being open or otherwise?

A. The bottles were properly sealed and had attached to them the label.

Q. You mean the tags?

A. The tags.

Q. Examine those tags in front of you and see if those are similar to the tags on the bottles delivered to you?

A. Those tags are similar to those that were attached to the bottles.

Q. Did you have any instructions about receiving the bottles or refusing to receive them or analyze them as to whether or not they ought to be in a certain condition?

A. Well, in all this bacteriological work, notes were taken of the condition in which the sample was received. If a 1104 sample in a bottle—if a bottle would be broken, a note would be made of that particular sample, or if they would contain sediment, or the stopper would contain some evidence of contamination—all of these samples would be properly noted, and a record and special reference would be made, and if the bottle would be contaminated the results would not be recorded as the official result.

Q. Well, were these bottles packed in ice, any of them?

A. They came to me packed in ice.

Q. Those that were received at the laboratory?

A. Those that I received, were packed in ice.

JUDGE SPRINGER: I don't care to ask him anything.

WALTER C. G. KIRCHNER.

1105 LOUIS SAUER,

called as a witness in behalf of the complainant, being first duly sworn, by the Commissioner, testified as follows:

DIRECT EXAMINATION.

By Mr. Jeffries.

Q. What is your name?
A. Louis Sauer.
Q. Where do you live?
A. 2000 South Second.
Q. St. Louis, Missouri?
A. St. Louis, Missouri.
Q. How long have you lived in St. Louis?
A. All my life, 34 years.
Q. What business are you engaged in, Mr. Sauer?
A. Saloon business at present.
Q. Were you ever employed by the City government here?
A. Yes sir.
Q. In what connection?
A. In the City Chemist's office.
Q. What particular work did you have to do with reference to the City Chemist's office?
A. Why I made a collection of water.
1106 When?
A. 1900, about September 17th or 18th, somewhere about that, for about one month.
Q. From September 17th or 18th?
A. Somewhere about that.
Q. 1900, extending through a period of about a month?
A. One month, yes sir.
Q. Who employed you?
A. Dr. Starkloff.
Q. Who is Dr. Starkloff?
A. He is health commissioner for the City of St. Louis.
Q. Who did you make reports to?
A. To Dr. Teichmann, City Chemist.
Q. Under whose supervision were you?
A. Dr. Teichmann's.

Q. Who is Dr. Teichmann?

A. He is City Chemist of St. Louis.

Q. Now state at what particular point you made collections of water?

A. Here at the Alton Waterworks; that is out in the river.

Q. How far out in the river?

A. Well out about where the current was about the strongest.

Q. That is the Mississippi River?

1107 A. Yes sir, about half a mile above the Waterworks.

Q. Now then, how often did you gather these samples?

A. Every day during that period.

Q. How far under the surface of the river did you go to get them?

A. Why, I would use that machine and go down as far as I could with it.

Q. Do you mean Complainant's Exhibit 15 (Indicating)?

A. Yes sir, this one and the smaller one.

Q. And the machine you used then was patterned after complainant's Exhibit 15?

A. Yes sir.

Q. And the bottle that you used in collecting the sample was a bottle similar to the one found in this machine?

A. Well one of those and two, gallon bottles.

Q. Well with reference to this particular sample?

A. Put it in the same bottle.

Q. Do you know what those samples were collected for?

A. I haven't the least idea.

Q. You don't know whether it was for chemical or bacteriological examination?

A. Didn't pay any attention to that, no sir.

Q. In addition to collecting these smaller samples, you
1108 collected larger samples too, did you?

A. Yes sir.

Q. What was the size of those larger bottles?

A. Half gallon,—the size of that larger bottle there (indicating).

Q. Complainant's Exhibit 16?

A. Yes, sir.

Q. Now, you collected the water in those larger bottles by means of the machine, one similar to the—

A. Similar to the smaller machine.

Q. Similar machines to complainant's Exhibit 15?

A. Yes, sir.

Q. You say you made collections every day?

A. Every day.

Q. Of both kinds of samples?

A. Both kinds.

Q. How many samples would you take each day?

A. That is, one sample each day, that is one small sample bottle and two large ones.

Q. One small bottle and two large ones?

A. Yes, sir, at one time.

Q. What would you do after you had collected those samples. In the first place state how you collected them?

A. I placed the bottle in the machine, the large bottle
1109 first, and then I would sink it down as far as I could; then draw up the stopper and fill the bottle and then drop it back onto it again and take it out of the water.

Q. In other words, you would open and close the bottle underneath the water?

A. Underneath the surface of the water, that is right.

Q. At that depth?

A. Yes, sir.

Q. Three feet?

A. Yes, sir.

Q. Now, what did you do after you took that bottle out?

A. Took it back to shore and sealed it.

Q. At once?

A. Well, I would put canvas over it.

Q. That is, the larger bottles you would?

A. The larger bottles I would put string around it, tie it up and seal it, and the seal was from the City Chemist's office; then I would put on the date, place of collection, my name, temperature of the water; temperature of the air and point it was collected at.

Q. Now, what would you do with it?

A. Bring it back to the City Chemist's office.

Q. Do that at once, would you?

A. Why, take the first train that I could and get back to the City here—get back about two o'clock.

1110 Q. How long would it take you to go out and get back to the City, after you left there?

A. I would make the collection of the water about ten o'clock, and get back to the City Chemist's office, about two o'clock, or five or ten minutes after two.

Q. Now, then, after you brought the bottles back to the City Chemist's office, what then did you do?

A. Turned them over to Mr. Teichmann, or Mr. Buckland, his assistant.

Q. What did they do with them?

A. That I don't know.

Q. Did you pack them in ice?

A. Put them into a can and packed them with ice and excelsior.

Q. Now state what you did with the smaller bottles when you collected them?

A. I put a piece of tinfoil over the top of it and then pasted canvass over it, put on the address, sealed it and put a tag on it similar to the one I put on the larger bottles.

Q. And put the same facts on the tags?

A. Put the same facts on the tags as on the others.

Q. What disposition did you make of it?

A. I placed it in with the other bottles in the chest.

Q. You made the same disposition of it?

1111 A. Same disposition that I made with the larger bottles.

Q. Did you make these collections on Sunday?

A. Every day, yes, sir.

Cross-examination waived.

LOUIS SAUER.

1112 DR. W. C. G. KIRCHNER, re-called for further direct-examination by Attorney-General Crow, testified as follows:

Q. These tags that I show you, what are they?

A. They are the tags that were attached to bottles that were collected for the Joliet station for bacteriological samples.

Q. Well, at what time?

A. From the period of November—of October to November.

Q. What year?

A. 1901.

Q. Are these tags from the bottles that were sent to you for your chemical or bacteriological analyses there, of the water?

A. Yes, sir.

Q. You know those are the same tags?

A. They are the same tags.

Q. What have they got on them?

A. They have on them the date; location of the places from which the sample was taken, the condition of the temperature; record of the water and the air; name of the collector and such other information as the collector would gather.

1113 Q. Did you inspect the work of those collectors up there while they were under your supervision at Joliet, and along the Illinois River up there, with reference to how they were doing their work?

A. I did.

Q. Well, how did they follow their instructions?

A. They followed their instructions very closely. I made frequent tours of inspection.

Q. You say you did make frequent tours of inspection?

A. I made frequent tours of inspection, yes, sir.

ATTORNEY-GENERAL CROW: Now, Judge Springer, let the record show the same thing with reference to this bunch of tags as the other; that they are offered in evidence, but not to be printed.

JUDGE SPRINGER: No objection.

No cross-examination.

WALTER C. G. KIRCHNER.

Adjourned until 9:30 a. m., following day, Saturday, February 28th, 1903, at same place.

Southern Hotel, St. Louis, Mo.

1114 9:30 a. m., February 28, 1903.

Continuation pursuant to adjournment.

Present, the Commissioner and the same counsel representing the respective parties.

ALBERT WINSCHELL,

a witness on behalf of the complainant, after being duly sworn by the Commissioner, was examined by Mr. Jeffries and testified as follows:

Q. What is your name?

A. Albert Winschell.

Q. Where do you live?

A. 3006 Missouri avenue.

Q. What city?

A. St. Louis, Missouri.

Q. How long have you lived in St. Louis, Missouri?

A. Eight years.

Q. Have you been engaged with the water works department of the city of St. Louis?

A. I have.

Q. What business are you in now?

A. Barber business.

Q. What were you from January 7 to March 28, 1900?

A. I was collecting water up on the river of the city of St. Louis.

Q. At what particular point of the Mississippi river?

A. It was at the Chain of Rocks.

1115 Q. Who were you collecting or making these collections for?

A. The city chemist, Dr. Tiechmann.

Q. When did you commence?

A. I think it was about the 6th of January, 1900, up until the 28th day of March, I think, something like that. I am not very sure, but it was between the 6th of January and the 28th of March.

Q. How often did you make collections?

A. I made collections every day.

Q. Sunday also?

A. Sunday and every day, yes sir, from the time I started until I finished.

Q. What was the character of the samples you collected, as to quantity?

A. Well, it was taken from the Missouri side.

Q. No, I mean the quantity, how much?

A. I guess a half a gallon bottle or a gallon bottle, I forget which. I don't know which. That is it right there (pointing to complainant's exhibit 15).

Q. I will ask you if complainant's exhibit 18 is a pattern or sample of the bottles you used in making collections?

A. Yes sir. That one and the other one too.

Q. Also complainant's exhibit 20?

A. Yes sir.

Q. Those are samples of the bottles you used?

A. Yes sir.

1116 Q. In addition to this size did you make any other collections?

A. Yes sir, the small size.

Q. Now I will ask you if the bottle complainant's exhibit 15 is a sample of the bottle used?

A. Yes sir.

Q. Where did you get the bottles that you used?

A. They were sent up, I suppose, from the city chemist's to Baden. I got a train there, you know, and went out from there. They were delivered there.

Q. Did you know they came from the city chemist's office?

A. Yes sir. The driver was ordered to deliver them there. I put them on the train myself.

Q. The driver was in the employment of Dr. Teichmann, was he?

A. Yes sir.

Q. Under whose instructions did you work?

A. Mr. Teichmann.

Q. Now state the particular places in the river you gathered these samples?

A. Well, the first sample started on the Missouri side about 400 yards above the Intake tower.

Q. How far from the shore?

A. About 300 feet.

Q. It would always be 300 feet?

A. No, it would vary sometimes. I would come as close to the same place as I possibly could, but on account of the ice I could not take it at the same place. Then I would go
1117 right straight across to the Illinois side and take on the Illinois side, and I would come back from the Illinois side and take it as I was coming down to the intake tower.

Q. Now with reference to the channel in the river, where would you take the sample?

A. Well, I would try to get as close to the Illinois side as possible, say 200 yards from the tower.

Q. Would you get in the channel?

A. Yes sir. There would be times I could not very well do it. The ice would be so, great chunks of ice would take me on the other side. I would try to get in the channel on the Illinois side.

Q. Now with reference to the intake, where would you take the sample?

A. About 100 or 200 feet from the tower, right straight from the intake tower as I was coming down.

Q. Now how deep under the surface of the water would you take the sample?

A. I supose it would be about two feet, a foot and a half or two feet.

Q. Now I will ask you to examine complainant's exhibit 15 and ask you whether or not that is a model of the instrument used by you in collecting this sample?

A. Yes sir.

Q. You used both of these sizes and a larger size?

A. Yes sir.

1118 Q. You used this size for one sample of bottles and the larger size for the larger bottles?

A. Yes sir.

Q. Now state just exactly in your own way how you worked this instrument, how you collected these samples?

A. Well, when I started out I took the temperature of the air in the first place, and when I got ready with my bottles I would take the temperature of the water.

Q. Did you open the bottle before putting it under water?

A. No sir. I had to take the temperature of the air first. As soon as I got the temperature of the air I had to put my bottles down and pull out the cork.

Q. Now state whether or not you put the bottle down under the water before pulling the cork out?

A. Yes. I took the temperature of the water and put this in there; after I had it under the water I pulled the cork out with a wire that was connected with one of those things.

Q. Then what did you do?

A. After it was full, when I thought it was full, I would let it fly back again and pull it out.

Q. Let the cork fly back?

A. Yes.

Q. Now you did that with reference to all these samples?

A. Yes sir.

Q. Both large and small?

1119 A. Yes sir.

Q. Now after you drew the machine with a bottle of water in it out of the water, what did you do with it?

A. I took the temperature of the air and water and the time of taking it out.

Q. Before that what did you do with the bottle?

A. I put it back in the little box I had.

Q. What did you wrap it with?

A. With some cloth or something, I don't know what it was. A piece of cloth.

Q. You wrapped it and sealed it then, did you?

A. Yes sir.

Q. Then what did you put on it after you had sealed it?

A. Well, I would not seal it until I got to the shore, because I had no chance of sealing it. Then I had a piece of sealing wax.

Q. After you had sealed it what did you do?

A. I would take it over to the depot.

Q. Did you tag it?

A. Yes sir.

Q. What did you put on the tag?

A. The date and the time of taking it out, and the temperature of the air, with my name on it.

Q. And the place?

A. Yes sir, the place.

1120 Q. That is the place where it came from?

A. Yes sir, the Illinois or the Missouri side.

Q. What did you do with them after that?

A. I would take them over to the office over there and seal them and put them in a little box and wait for the train to come down and take them down. I went down with them to the city chemist's office.

Q. You took them to the city chemist's office yourself?

A. Yes sir.

Q. Whom did you deliver them to?

A. There was a buggy waiting for me at Baden when the train got down, and I delivered it directly to the city chemist.

Q. Now you made the same disposition of all the samples you collected?

A. Yes sir.

Q. From the 6th day of January to the 28th day of March, 1900?

A. Yes sir.

CROSS-EXAMINATION,

By Mr. Springer.

Q. You stated, I believe, that the places on the Missouri 1121 shore were 400 feet from the land?

A. No, it varied.

Q. 400 yards, you said?

A. No sir, from the intake tower up above. I went from the intake tower that far above on the river, you know, to take my samples. Then I went out 100 or 200 feet from the shore to take the water from there.

Q. How far from the Missouri shore was it that you took your samples?

A. It varied from 100 feet to 200 feet.

Q. I thought you said 400 feet?

A. No sir.

Q. I think you said 400, and I thought you were mistaken.

MR. JEFFRIES: He says he said 400 feet above.

THE WITNESS: I went from the tower.

MR. SPRINGER: 400 feet above the intake tower—above what did you go 400 feet?

A. The intake tower. I took the water 100 or 200 feet from the Missouri shore up. Sometimes I took the same place, but the ice was so heavy I could not get out to the same place, and it would be 100 or 200 feet.

Q. How far from the Illinois shore was it that you took the samples?

A. It would be about the same thing as on this side. I
1122 could not get near to the shore. The ice would not let me go over. If I got over there I would have a time getting back. It would be about the same distance. I would try to get as close as I could. It would sometimes be 100 feet and sometimes 200 feet.

Q. From the Illinois shore?

A. Yes sir.

Q. Where is Baden—is that the place you mentioned?

A. Yes sir. Within the city limits, I guess.

Q. On this side of the river?

A. Yes. Right at the end of the Broadway car line.

Q. How long from the time you took the first sample until these bottles would reach the city chemist's office?

A. About four o'clock I would come in. I would get through with the bottles about two o'clock or half past one, and I would try to catch that train that comes in there a quarter to three at the Chain of Rocks. I would have my samples there and come down with them. Sometimes it would take me a little longer to get my boat through the ice.

Q. What time in the morning did you take them?

A. Why, I left—or started at nine o'clock, generally.

Q. And generally you would reach the city chemist's office at four o'clock?

A. Four o'clock or half past four.

1123 RE-DIRECT-EXAMINATION,

By Mr. Jeffries.

Q. You mean you would leave St. Louis at nine o-clock in the morning?

A. Yes sir, I would start at nine o'clock. I would catch that train at Mound street here. ALBERT J. WINSCHELL.

1124 FRED DIESELHORST,

a witness called on behalf of the complainant, after being duly sworn by the Commissioner, was examined by Mr. Jeffries, and testified as follows:

Q. What is your name?

A. Fred Dieselhorst.

Q. Where do you live?

A. 1222 Hebert street.

Q. St. Louis, Missouri?

A. Yes sir.

Q. How long have you lived at St. Louis?

A. All my life, 31 years.

Q. State whether or not you ever collected any samples of water out of the Missouri or Mississippi or Illinois river for Dr. Teichmann of the city chemist's office?

A. Well, I collected from the Missouri river for about five months I guess every day.

Q. Well, when?

A. I cannot just remember the date, whatever time they started—When was that, in January, 1901—from January until—

Q. January 1900 until when?

A. From January 1900 for about five months straight, I guess, from the Missouri river.

Q. Then where did you go?

1125 A. Then they had me one day at Grafton, one day at Alton, one day at Hartford, and the next day at Bellefontaine, four times a week, one day at each place.

Q. Each week?

A. Each week, yes sir. That was for about two months I guess I went up there. tt was about eight months all told, all the time I went there.

Q. Now whom did you work under?

A. Well, for the first couple of months I worked under Flad.

Q. The water commissioner?

A. Yes sir, for a couple of months, and after that for a couple of months I worked under the city chemist.

Q. During all the time, who gave you instructions as to the manner of collecting these samples?

A. Why some engineer by the name of Mercereau, I believe.

Q. Do you know his first name?

A. No sir.

Q. Now after Mr. Mercereau quit issuing orders whom did you work under?

A. Under Dr. Teichmann.

Q. State the particular place that you obtained the samples in the Missouri river?

A. Why, right at Ft. Bellefontaine, Missouri.

Q. You say you commenced in January 1900 and for five
1126 months you took samples?

A. For five or six months at the same place.

Q. How often?

A. Every day.

Q. How many samples did you take each day?

A. When I first started I took four big bottles, I believe, and two small bottles, and afterwards only two large bottles and one small bottle.

Q. Now state the manner in which you took those samples?

A. It was with these machines here.

Q. I will ask you if complainant's exhibit 15 is a pattern of the machine used by you in taking the samples?

A. Yes sir. And a machine the same as this was used for the small bottle.

Q. The small bottle in one of these machines is one of the bacteriological samples you collected daily?

A. Yes sir.

Q. Now the larger bottles were taken in the larger pattern of machine?

A. Yes sir.

Q. Now what time of day did you generally take those samples?

A. Well, different times. Usually catch the Burlington train here at 8:20 and get up there about 9:30; generally got
the train back, the first train to leave, about 1:10, I think,
1127 and I took them any time in between, generally took the
Burlington back. Sometimes took the 10 o'clock, sometimes maybe the 11.

Q. And start back at one o'clock?

A. Start back at one o'clock. 1:09 I think it is.

Q. Now state the manner in which these collections were made and the particular places in the river you took them?

A. Why we took the sample right at the channel of the river.

Q. How deep under the surface of the water?

A. About three feet, I guess.

Q. The full depth of the machine?

A. About three feet down in the water. Just kept our hand from getting into the water.

Q. Just state whether or not you would open the bottle under the water or out of it, to pull the cork out?

A. Always supposed to cork them under water.

Q. To open them and cork them under water?

A. Yes sir.

Q. You always did that?

A. We always tried to, when I was there; sometimes it would not work. The ice would be coming down and the water would get in there and it would not work, and you could not close them.

Q. What did you do after you brought the samples out?

A. Up on the bank there was a little shanty, and we
1128 would go right up there and get a piece of white cloth and
put it around the stopper and seal them, and put them on tight, and take the temperature of the air and the water and the place where it was taken, and sign our name to it on the tag.

Q. That is what you did with the larger bottles?

A. The large and the small bottles too.

Q. Did you put tin foil around the small one in addition to the rag?

A. Didn't put any rag around the small ones at all. Just the tin foil.

Q. And then you wrapped them?

A. Wrapped them and sealed them.

Q. What did you do with them after that?

A. We had these tin boxes that we placed them in, and we put them in ice and had them right there; they would not get out of our sight until the train came.

Q. After you did that what did you do?

A. Put them in the box and when the train came along brought them down to the chemist's office.

Q. What did you do with them then?

A. Turned them over to some fellow by the name of Taylor, who took them in charge.

Q. Both the chemical and bacteriological samples?

A. Yes sir.

1129 Q. Now that same routine of work you went through every day during the whole time of your employment?

A. Yes sir.

Q. Now what did you do with the samples that you collected at Grafton?

A. Just the same way.

Q. And you brought them right down to the chemist's office?

A. Yes sir.

Q. The same day?

A. Yes sir.

Q. How about the samples collected at Hartford?

A. They were all taken the same way, Hartford, Grafton and Bellefontaine.

Q. Now did you work at any other place collecting samples?

A. No sir. The time I went to Bellefontaine, though, there were some days the river was so bad I could not go out on it. The machine would not work. There was so much ice coming, down, so I got me a bucket and we took the water out of the bucket, but only certain days the river was so bad up there and the ice was coming down. I would not go out there for anybody when that ice was coming down. Then we dropped the bucket right from the bridge. The watchman there used to help me drop the bucket.

Q. In the channel?

A. Right in the channel, yes sir.

1130 Q. What did you do with the samples after you brought them to the city chemist's office? Did you see them do anything with them?

A. There was a fellow there by the name of Taylor who took charge of them.

Q. Did he put the bottles in the refrigerator?

A. Yes sir.

Q. Did you always see him do that?

A. Not always, but sometimes.

FRED. DIESELHORST.

1131 THOMAS A. BUCKLAND,

A witness called on behalf of the complainant, after being duly sworn by the Commissioner, was examined by Mr. Jeffries and testified as follows:

Q. What is your name?

A. Thomas A. Buckland.

Q. Where do you live?

A. St. Louis, Missouri.

Q. How long have you lived in St. Louis?

A. Very nearly all my life.

Q. What is your business or occupation?

A. Assistant city chemist.

Q. How long have you been assistant city chemist?

A. About ten years.

Q. Do you mean assistant city chemist of the city of St. Louis?

A. Yes sir.

Q. You are under Dr. Teichmann?

A. Yes sir.

Q. How many years, did you say?

A. About ten.

Q. You have been assistant city chemist continuously during that time, ten years, down to the present time?

A. Yes sir.

1132 Q. I will ask you what you know about receiving various samples of water that were brought to the city chemist's office for chemical and bacteriological analysis, from January, 1900, down to September, 1901, or during the whole time of that investigation?

A. Well beginning, I think it was, about January 23—

the "Register of samples" will show the exact date. I could identify it.

Q. I will ask you to examine these tags, showing the registry of samples so collected from the various records, and state whether it is a correct record of the various samples that came to your office?

A. I can identify this one. Do you want me to look over them?

Q. You can tell by looking at them?

A. Yes, I can tell. This shows the receiving of the samples for analysis during this entire investigation.

Q. Now then, as these samples came in, what was attached to the bottle?

A. Tags.

Q. What was on the tags?

A. The tag contained the date, place of collection, the name of the collector, the temperature of the air and the temperature of the water; the place of collection, indicating the river and the location on the river, as far as I remember, in most cases.

Q. Now state where these collectors obtained the bottles
1133 that were used in collecting the samples?

A. They obtained them from the city chemist's office.

Q. Were these particular bottles subjected to any particular treatment before sent out?

A. Well, they were thoroughly cleaned.

Q. How about the bottles for the bacteriological samples?

A. The bottles for the bacteriological samples were thoroughly cleaned and sterilized.

Q. Now state whether or not these samples were sealed when they came in?

A. Yes sir.

Q. Always?

A. Always sealed with sealing wax, and the seal prepared for the purpose by the city chemist's office.

Q. What was the object in having them sealed?

A. To prevent the possibility of any tampering with or contamination of the sample.

Q. You assisted in keeping this record of samples as they came in, did you?

A. Yes sir.

Q. And saw that it was done?

A. Yes sir.

Q. Now I will ask you to examine this bunch of tags, and ask you if these are a part of the tags received in your office, attached to the bottles of samples of water?

1134 A. Yes sir. I can say this, that I have examined the tags.

Q. I will ask you to examine complainant's exhibit 17 and state whether that is a sample of the tags that came in on the bottles?

A. Yes sir.

Q. Now what disposition was made of the smaller bottles of water, the bacteriological samples?

A. The bacteriological samples were turned over to Dr. Ravold and his assistants for bacteriological examination.

Q. Now whom did you turn them over to?

A. Well, part of Dr. Ravold's work was done at the office of the city chemist; that is in the quarters connected with the office of the city chemist, adjacent to the office of the city chemist, and I believe that the first lot that was received were examined there.

Q. They were always turned over by you or someone in charge, were they?

A. They were either turned over personally or placed in the ice chest.

Q. Where they came in and got them?

A. Yes sir.

Q. What does the 2L and 1L on these different tags mean?

A. Well, I can't say that I remember just what it does mean.

1135 Q. State whether or not you received any bottles that were unsealed. If so, what disposition did you make of them?

A. What is that?

Q. Suppose a bottle would come in with the seal broken or unsealed?

A. If they were not immediately turned over to someone responsible present, it would be sealed. That is my recollection.

Q. Supposing it would come in from the collector unsealed, take these samples that were shipped in or expressed in.

A. Well, I could not say that I remember.

Q. Were they thrown out, the bottles thrown out, or not?

A. Well, I know sometimes they were thrown out, and I presume they were, any one that happened to come unsealed, but I cannot remember.

Q. State whether or not you know that the bottles were sterilized before they were sent out?

A. Well, that was a part of the bacteriological work with which I was not connected, but I saw the bottles in process of sterilization frequently.

Q. They were sterilized there in your office, were they not?

A. They were sterilized in the adjacent quarters, not in the rooms in which we worked. I do not believe the bottles got out without being sterilized.

1136 CROSS-EXAMINATION, By Mr. Springer.

Q. Mr. Buckland, did you assist in the chemical analyses of these waters?

A. Yes sir.

Q. What part of this work did you perform yourself?

A. Well now, Dr. Teichmann wishes me to reserve my testimony.

ATTORNEY-GENERAL CROW: You answer his question. Never mind Teichmann or what Teichmann wants.

MR. SPRINGER: What part of the work did you perform?

A. Well, I had more or less work in all various estimations, the ammonias I worked on mostly at first and the nitrites later.

Q. How long a time elapsed after the samples were received at the city chemist's office, until you made the chemical analysis?

A. Well, the analysis was commenced frequently almost immediately after the samples were received. A very short time after the samples were received.

Q. Those witnesses who took the samples stated that the samples generally arrived in your office between four and five o'clock in the afternoon?

A. Yes sir.

Q. Were those examined that day or later?

A. Well, the analysis was commenced that day as a rule.

Q. What were your office hours for that purpose?

1137 A. Well, probably the first period of investigation, that is commencing I think January 23, we frequently worked until twelve o'clock at night, and later.

Q. What year?

A. 1900, I believe that was January 23.

Q. When these bottles contaning samples of water were received at the city chemist's office, what was usually the condition as far as the temperature was concerned?

A. As a rule they were cold.

Q. What do you mean?

A. Right cold. I mean they were cold to the touch of the hand.

Q. What temperature about?

A. I could not say. I did not take the temperature.

Q. You did not take the temperature?

A. No sir.

Q. Were they in ice at the time they were received at your office?

A. Well, I think most of the time they were.

Q. How long a time was required for the analysis of each particular sample?

A. Well, certain portions of the analysis were done immediately. That is, those in which changes were likely to take place; and with other portions it was immaterial how long a time elapsed.

1138 Q. What portion did you regard as material to be taken up at once?

A. The nitrites and the ammonia were the most important.

Q. State what you did in regard to the analysis for the purpose of ascertaining the amount of ammonia in the water?

A. Well now, gentlemen, I would like to have my testimony in this respect put off until after Dr. Teichmann testifies. I have absolutely no memorandum—

ATTORNEY-GENERAL CROW: He means the method you followed. He don't mean for you to give any minute analysis of what you did.

A. In estimating the ammonia we used the general and usual ammonia method. The first time we used the modification recommended by Mr. Mason.

Q. Who is he?

A. He is the author of a book on water analysis and is connected with the Rensselaer Polytechnic Institute. And a part of the time the original method of Wankly and Smith was used.

JUDGE SPRINGER: It is understood that these gentlemen will be recalled.

ATTORNEY-GENERAL CROW: Yes sir.

JUDGE SPRINGER: Gentlemen, I would like for the record to show that Attorney-General Hamlin of Illinois may have the privilege of recalling any of these witnesses when the 1139 investigation is resumed, if he desires to ask any questions in behalf of the State of Illinois.

ATTORNEY-GENERAL CROW: Yes, I have no objection to that. I do not suppose he will want to ask any questions.

JUDGE SPRINGER: I do not know that he will, but he might.

THOS. A. BUCKLAND.

1140 EDWIN A. SLUDER,

A witness called on behalf of the complainant, after being duly sworn by the Commissioner, was examined by Mr. Jeffries, and testified as follows:

Q. What is your name?

A. Edwin A. Sluder.

Q. Where do you live?

A. 3707 Page Bl.

Q. How long have you lived in St. Louis?

A. All my life.

Q. I will ask you if you have done any work in the way of collecting samples here in the Missouri river under the direction of Dr. Teichmann, city chemist, city of St. Louis?

A. Yes sir.

Q. State the particular points from which you gathered this water?

A. Above and below Omaha, Nebraska, and above and below St. Joe, above and below Kansas City, Missouri, on the Missouri river, and on the Kaw river, above Kansas City, Kansas.

Q. When you speak of Omaha and Kansas City, you mean in the Missouri river?

A. Yes sir. On the Kaw river, there was one taken right near the Missouri river, just up the Kaw river some distance.

Q. Up the mouth?

A. Yes sir.

1141 Q. What other places?

A. Jefferson City, and near Herman.

Q. In Jefferson City and at Herman?

A. And Herman, Missouri, and St. Charles, Missouri.

Q. When was it you took the samples at Omaha?

A. I have a record of it here, if I can look at that.

Q. You made those things at the time you took the samples?

A. Yes sir.

Q. You can refresh your recollection.

A. November 13, 1901.

Q. How many samples did you take at Omaha?

A. I took two samples, one above the city and one below the city.

Q. Now then, what particular part of the river did you take them in, with reference to the channel of the river?

A. Well, a copy of the tag reads like this: That was on the bottle I shipped to St. Louis. The date, 11/13/01. Time, 5:45 p. m. Location, Bellevue, Nebraska. Nebraska bank current. Temperature of air, 7; temperature of water, 5½. Collector, Ed. A. Sluder. Sample taken in current about 75 feet from Nebraska bank, 1½ miles below Bellevue, Nebraska.

Q. That temperature was Fahrenheit, was it?

A. No sir, that was Centigrade.

Q. Did you make any other collections there than those 1142 two you mentioned?

A. Not at Omaha that first trip. Later on I made some.

Q. When did you go back?

A. November 24, 1901. I was in Omaha and took a sample at the Omaha waterworks.

Q. You took it out of the waterworks?

A. No sir, out of the channel near the waterworks.

Q. Now coming down to St. Joe, when did you take the sample out of the river at St. Joe?

A. On the 14th of November, 1901.

Q. Now state the particular place in the river that you got that sample?

A. Just out from the pumping house about three feet deep, it was taken in the channel; that is above St. Joe.

Q. How far above?

A. By water or by land?

Q. By water?

A. By water it is about 16 or 17 miles. Or two miles and a half by land.

Q. Now how many trips did you make to St. Joe?

A. Two.

Q. When was the second trip, or was that the second trip you gave there?

A. No sir. November 25 was the second trip.

1143 Q. Did you collect water at the same place you did at the first trip?

A. Yes sir.

Q. Now state when you made a collection of the samples at the Kaw river, in the Kaw river.

A. On November 17, 1901.

Q. Now at what particular point on the river did you take that sample?

A. Above Argentine, Kansas, on the Kaw river.

Q. How far is that from the mouth of the river approximately?

A. About four miles, I think.

Q. Now where did you make the collection, what part of the river?

A. In the channel of the river, 3½ feet deep.

Q. How many collections did you make there?

A. One large and five small samples.

Q. Now how many trips did you make?

A. I made two.

Q. Now when was the second trip?

A. November 29, 1901.

Q. Now how many collections did you make then?

A. I made one.

Q. In the same place, was it?

A. Yes sir. One large sample made in the same place, 1144 and five small ones made in the same place.

Q. That is, you made those collections the last trip in the same place in the river, or at the same point in the river, that you made the collections on the first trip?

A. Yes sir, as near as I could get it.

Q. Now then, the Kansas City—when did you make that trip and where did you make collections?

A. In the Missouri below Kansas City.

Q. How far below, do you remember?

A. Ten miles below Kansas City. About ten miles.

Q. What part of the river with reference to the channel?

A. In the channel of the river.

Q. How many collections did you make?

A. One large bottle and five small ones. The small ones were taken across the river, all the way across.

Q. You cross-sectioned the river?

A. Yes sir.

Q. With these small bottles you cross-sectioned the river?

A. Yes sir.

Q. How far apart did you take these samples?

A. I tried to take them in equal distances across the river.

Q. So that you got five of them?

A. Yes sir.

Q. How wide was the river where you took the samples?

A. Nearly half a mile wide.

1145 Q. How far from the shore did you take the first samples, or did you take the samples? The first sample of the cross-section, how far was it from the shore?

A. Well, I tried to divide it up. I would not take it in shallow water where there was no current at all. I got out where the water was running, and I would begin there.

Q. The samples then were taken from the current, running water?

A. Yes sir, running water.

Q. When did you go back there for the second trip?

A. I took them above that on that same trip.

Q. How far above?

A. At the waterworks.

Q. Did you cross-section the river there?

A. Yes sir.

Q. How many samples did you take there?

A. Five small samples and a large one.

Q. Were the small samples taken in the same way?

A. Cross-section samples.

Q. They were cross-section samples and taken in the same manner as this taken ten miles below Kansas City?

A. Yes sir.

Q. How many large samples did you collect?

A. One.

Q. Now then, after that, when did you go back to Kansas City?

1146 A. On the 28th of November, 1901.

Q. Where did you take the sample?

A. I took one large sample and five small samples. Cross-sectioned the river there.

Q. In the cross-sections were the samples taken in the same manner as the cross-sections on the first trip?

A. Yes sir.

Q. How far above or below the city?

A. This one was taken at the waterworks. And then there was one set of samples taken at the waterworks, and one set of samples taken about ten miles below.

Q. Now then, each trip you collected samples, cross-section samples, numbering five of the small bottles and one sample of the larger bottle?

A. Yes sir.

Q. Now then did you go back to Kansas City any more?

A. No sir. That was my second trip. I only made two trips.

Q. Now coming on down the river to Jefferson City, state from what particular place in the river those samples were taken, and when?

A. November 19, 1901, one mile above the waterworks, Jefferson City, Missouri, in the channel six feet deep. The channel was six feet deep. The sample was taken about three.

Q. How many samples did you take there?

1147 A. One large sample only.

Q. Did you go back there any more after that? First I will ask you, when was that sample taken?

A. That was taken on the 19th.

Q. Now then, did you go back there?

A. Yes sir.

Q. When?

A. December 1, 1901.

Q. When did you take the sample then?

A. I took the sample in the same place.

Q. As the previous sample?

A. Yes sir.

Q. Was it a large sample or a small one?

A. A large sample.

Q. That was all the samples you took at Jefferson City?

A. No sir. I took a sample below the city.

Q. Now when did you take that, at the same time?

A. Yes sir, the same dates.

Q. How far below?

A. Five miles below Jefferson City.

Q. Almost to the mouth of the Osage. Do you know where the Osage goes into that?

A. Yes sir.

Q. Was it below or above that?

A. It was above that. I tried to go down the Osage and could not. 1148

Q. Now where did you take those samples, with reference to the channel of the river?

A. In the channel of the river three feet deep. The channel there was about 12 feet deep.

Q. Did you take large or small samples?

A. Large samples only.

Q. How many times did you visit that place and take samples?

A. Twice.

Q. The samples were taken at the same place both times?

A. Yes sir.

Q. And you took only large samples?

A. Yes sir.

Q. Now coming on down the river to Herman.

A. November 20, 1901, was one large sample taken, and one mile above Herman, the south shore, in the channel.

Q Any small samples taken there?

A. No sir.

Q. Now then, where was the next sample taken?

A. On the same day there was one large sample taken about three miles below Herman.

Q. Did you go back there any more after that?

A. Yes sir.

Q. When?

A. On December 1, 1901.

Q. How many samples did you take and where?

1149 A. One mile above Herman, Missouri. One large sample in the channel, on December 1, 1901, about three miles below Herman, one large sample.

Q. Those samples were taken out in the Missouri river?

A. Yes sir, in the Missouri river.

Q. Now were those all the samples you collected in the Missouri river near Herman on that trip, those two trips?

A. Yes sir. I made two trips there.

Q. Now coming on down the river, where were the next samples collected?

A. At St. Charles, Missouri.

Q. State what you did at St. Charles.

A. November 22, 1901, location, one-half mile above St. Charles, Missouri, in the channel. One large sample taken; that was all.

Q. Now there was no other place in the river you collected any samples at all?

A. Yes sir, on the same day, 1½ miles below St. Charles, Missouri, there was one large sample taken.

Q. No small ones?

A. No sir.

Q. Did you go back there?

A. Yes sir, I went back there, December 3, 1901, and took one large sample at a mile and a half below St. Charles, and I took a set of cross-section samples at the same place.

1150 Q. How many trips did you make there?

A. Two.

Q. You cross-sectioned at both trips?

A. No sir, only the last trip. Then I took a set of cross-section samples and one large sample 1½ miles above St. Charles, Missouri.

Q. Now these cross-section samples were all selected from running water, were they, in the channel?

A. Not in the channel, no sir. They were collected in running water. They were not collected where the water was lying stagnant or anything of that sort. Simply where the water was running all the time, if it was right up against the shore and six inches deep it was taken there, to start with, and if it was 40 feet away from the bank it was taken there. I took them in that way.

Q. Now these samples that you took running across the river, cross-sectioning the river, were small samples?

A. Yes sir.

Q. Now those were all the samples you collected from the Missouri river and the Kaw river, that you have just stated?

A. Yes sir.

Q. Who sent you up there?

A. Dr. Teichmann.

Q. Who is Dr. Teichmann?

1151 A. The city chemist of the city of St. Louis.

Q. Who instructed you how to do the work, did he?

A. Yes sir, he gave me instructions how to take the samples.

Q. I will ask you to examine complainant's exhibit 15 and state whether or not this is a model of the machine used by you in collecting these samples?

A. Not on the Missouri river, not that size.

Q. You had a larger size?

A. I had one larger than that, but it worked about the same as that, in taking the bottles, like that.

Q. Take the size of samples known as complainant's exhibit 16.

A. Yes sir, that is the bottle.

Q. And when you spoke of the larger samples, you had reference to bottles of this character and size, did you?

A. Yes sir.

Q. Now when you spoke of the smaller samples, or the small samples, you had reference to bottles of the size contained in complainant's exhibit 15, did you?

A. No sir.

Q. Similar to that?

A. No sir, it is larger. I think it holds about a pint. There was no machine or apparatus to put them in, used to hold them in at all. I had to hold them in my hand.

Q. How far down under the surface would you go?

1152 A. Some were taken as deep as I could reach with my arm, some of them, and the others were taken on the surface.

Q. Right on top of the water?

A. Yes sir. Let the surface water run into it.

Q. Now the larger samples were taken three feet under the surface of the water?

A. About three feet under the surface of the water.

Q. And in the channel?

A. Yes sir.

Q. Now after those samples were collected by you, what did you do with them?

A. They were all sealed and cloth put over them and tied with a string and sealed, packed in ice and shipped to the city chemist's of St. Louis.

Q. Now how soon after you collected the samples before you shipped them?

A. Why, the first train that I could ship them on.

Q. How soon after they were collected before you packed them?

A. That would depend upon how far I had to travel to get back to the hotel.

Q. What I want to know is, you did it at once, did you?

A. I did it immediately, as soon as I could get where I could.

1153 Q. When you shipped them you directed them to whom?

A. The city chemist's, St. Louis, Missouri.

Q. Did you ship or express small bottles the same way?

A. Yes sir.

Q. From the same place?

A. Yes sir.

Q. Now how did you seal those, or wrap them?

A. There was a piece of cloth put over them and tied.

Q. Any tin foil put on them?

A. No sir, not over the cross-section samples.

Q. Now what you said with reference to sealing or tying these bottles applies to all the samples you collected, does it?

A. On the Missouri river, yes sir.

Q. And you shipped them all, or expressed them all to the same place?

A. Yes sir.

Q. Now in addition to this work, state whether or not you did any work in the way of collecting samples, and if so where and when?

A. I collected samples in the Mississippi river above Alton.

Q. When?

A. I think it was begun in September, 1901.

Q. How long a time?

A. And lasted until about the first week of November, 1901.

Q. Now how far up the Mississippi river from Alton did 1154 you collect those samples?

A. About a mile and a half, I think or two miles.

Q. What part of the river did you take them from?

A. From the channel.

Q. How deep under the surface of the water did you collect?

A. About three feet deep.

Q. Did you use the machine to collect this?

A. Yes, all except the cross-section samples I took there.

Q. Did you use or take the cross-section samples daily?

A. No sir, only part of the time, whenever I had instructions to take them.

Q. Now you collected daily samples, didn't you, of a particular kind?

A. Yes sir.

Q. What were those?

A. That was the large gallon bottles, collected two of them. I collected one small sample like you showed me the apparatus and bottle of.

Q. Well, you collected one small sample in the bottle similar to the bottle contained in complainant's exhibit 15, did you?

A. Yes sir.

Q. And used the machine of the same model?

A. Yes sir.

1155 Q. Now what did you do after you pulled the samples out of the water?

A. I saw they were thoroughly corked, and then there was a piece of tin foil that had been dipped in a solution of carbolic acid that was put around the stopper, and a piece of cloth put over that and tied. Then they were sealed, packed in ice and brought down to St. Louis.

Q. And where delivered?

A. To the city chemist.

Q. When you put the machine in the water you uncorked the bottle and corked it before you drew it out, did you?

A. Yes sir.

Q. What did you do with the larger samples, the same thing?

A. No sir, the larger samples we didn't use any tinfoil.

Q. Did you pack them in ice?

A. Packed them in ice and brought them down to the city chemist's office here in the city.

Q. How often did you take those samples?

A. Daily.

Q. You made the same disposition of them every day?

A. Yes sir.

Q. Sundays included?

A. Sundays included.

Q. You say you worked under instructions?

A. Yes sir.

1156 Q. From whom?

A. Dr. Teichmann.

CROSS-EXAMINATION, By Judge Springer.

Q. You spoke about taking samples at cross-sections below Kansas City, and some other places; what do you mean by that?

A. There were five samples that were taken across the river. There was surface water in four of them, and in the channel it was taken below the surface. A small bottles that held about a pint. I would go straight across the river.

Q. Did you take those in the Missouri river, did you take those cross-section samples?

A. Two places on the first trip, that was above and below Kansas City. And the second trip I took them at Omaha, above and below Omaha; above and below St. Joe, above and below Kansas City; and then at St. Charles, Missouri, I took them above and below St. Charles.

Q. You stated the last time you took them in St. Charles you didn't take cross-sections from above or below?

A. The last time I did take samples there.

Q. When was it you didn't take them?

A. On the first trip.

Q. Why didn't you take them?

1157 A. I didn't have instructions to.

Q. How long after you took these samples in the small bottles was it, from the time you took them up until the time they reached the city chemist's office in St. Louis?

A. From where?

Q. Beginning with Omaha.

A. I do not know just how long it took the express company to get them there or what time they were delivered.

Q. You put them in the express office the day you took them?

A. Yes sir.

Q. How many hours after taking them before the train would leave, carrying them to St. Louis?

A. From the time I took them until they were on their way here, on the train, do you mean?

Q. Yes.

A. One was taken at 10:30 in the morning and the other at 4:30 in the afternoon the same day. And I think the train left between seven and eight that evening.

Q. They would reach St. Louis the next day or the next morning sometime?

A. I think they arrived here sometime the next day.

Q. How were those small samples packed, do you know?

A. Thoroughly packed in ice.

Q. Were those small samples intended for bacteriological examinations or chemical?

1158 A. I could not say. I was not told.

RE-DIRECT EXAMINATION, By Mr. Jeffries.

Q. Where did you get these bottles you collected the samples in?

A. For where?

Q. For the various places, where did you get the bottles?

A. Some I took with me from the city chemist's office and others were shipped to me from the city chemist's office.

ATTORNEY-GENERAL CROW: Now I would like to have an understanding with you, Judge, and that is if we want to we can make this time up at nights. I do not expect we will need it.

JUDGE SPRINGER: That will be all right.

ED. A. SLUDER.

Whereupon an adjournment was taken until ten o'clock Monday morning, March 9, 1903, at the Southern Hotel.

1159 Southern Hotel, St. Louis, Mo. 10 a. m., March 9, 1903.

Present, Frank S. Bright, Esq., Commissioner of the Supreme Court of the United States, Attorney-General Crow, S. B. Jeffries, Esq., William F. Woerner, Esq., representing the complainant; Attorney-General Hamlin, W. C. Johns, Esq., representing defendant, State of Illinois; Judge William M. Springer, representing defendant Sanitary District of Chicago.

1160 Session resumed at the Southern Hotel, St. Louis, Mo., pursuant to the following order of the Supreme Court of the United States

On the consideration of the stipulation of counsel as to the taking of testimony in this case, filed and submitted herein on March 2nd, 1903.

It is now here ordered by the Court that in addition to the testimony heretofore taken herein the parties may resume the taking of testimony on March 9th, 1903, and proceed with all convenient speed, so that all the testimony shall be filed in the office of the clerk of this Court on or before Monday, October 12th, next.

March 3rd, 1903.

1161 THEODORE G. RUFF, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION, by Mr. Woerner.

Q. Your name is Theodore G. Ruff?

A. Yes, sir.

Q. What is your business, Mr. Ruff?

A. I am porter and grain sampler for the John Wall Commission Company, St. Louis.

Q. What was it prior to that time?

A. Up to that time I was travelling for a wholesale grocery house, Wolffing & Co.

Q. Wholesale grocers?

A. Yes, sir.

Q. Were you in the employ of the City of St. Louis at any time?

A. Yes, sir.

Q. When?

A. I was employed by the City of St. Louis under Mr. Holmes—I had an appointment as clerk of the settling basins.

Q. Clerk for the settling basins?

A. Yes, sir.

Q. Did you have anything to do with the collection of water samples?

A. Yes, sir.

1162 Q. State when?

A. I think it was on the 6th of March.

Q. Of what year?

A. 1900, that Mr. Fladd sent for me, and Mr. Adkins had sent me up to Grafton to sample water in the Illinois and Mississippi Rivers.

Q. Mr. Fladd is the Water Commissioner and Mr. Adkins is his assistant?

A. Yes, sir.

Q. What year was this, are you sure?

A. 1900.

Q. Now, are you sure?

A. Pretty positive.

Q. About the year I mean?

A. Three years ago.

Q. Do you mean two years ago last fall?

A. Now, you have got me right there on that date.

Q. Three years ago was it or two?

A. Three years ago.

Q. Well, then it was 1900, wasn't it?

A. I followed Mr. Wenzel, I think it is.

Q. Well, you are sure it was three years ago?

A. About three years ago.

Q. Now, Mr. Ruff, state what you did?

A. I used to leave at a certain time every day and travel
1163 up to Wilson's Ferry and draw the water from the Illinois channel and come back and go up the Mississippi about three miles north of Grafton and draw about two bottles, two one gallon bottles, and two small bottles, about 3½ feet under the water. We corked and uncorked under the water and brought them back to the hotel and sealed them and put them into a box, packed in ice, and then got up the fish from the fishermen which he had caught, live fish, and also put them back in this package, sealed this package and sent it to the Health Commissioner of the City of St. Louis.

Q. During what period of time did you do that?

A. From the 6th of March to the 1st of October in the same year.

Q. And how often during that time, every day?

A. Every day, Sundays, holidays, rain and shine.

Q. You say you sent them to the Health Commissioner?

A. Yes, sir, to the city chemist, Mr. Teichmann, is what we addressed them to.

Q. Now, Mr. Ruff, just state at what points you took this water?

A. In the Illinois River at Wilson's Ferry and the Mississippi River.

Q. Now, wait a minute. Just state where Wilson's Ferry is, on the shore of the Illinois?

A. Three miles above Grafton.

1164 Q. And at what other points?

A. And Mississippi River 3 miles above Grafton.

Q. Any other points?

A. No, sir.

Q. Well, what part of the river did you collect them from?

A. From the channel.

Q. How far from the shore and which shore?

A. From the shore—in those rivers, why it is generally almost the center of the river.

CROSS-EXAMINATION, by Judge Springer.

Q. You were engaged in collecting samples of the water in the rivers at these two places you state?

A. Yes, sir.

Q. What did you say you did with these samples?

A. I had a sort of a driver, what you might call it, an instrument which held the bottle, with a wire which would uncork the bottle and cork it under water, and after I had them filled, why I would bring them back to Grafton, to the hotel and seal these bottles and pack them in the box and ship them to the city chemist.

Q. How did you ship them?

A. Shipped them in a wooden case packed in excelsior and ice.

1165 Q. In what way I mean, by express?

A. By express.

Q. By express?

A. Yes, sir.

Q. What time in the morning would you collect these samples?

A. That would be about two o'clock in the afternoon, just before train time.

Q. Just before train time?

A. Yes, sir, just so I could make the trip before train time.

Q. What time did the train leave Grafton?

A. Five-thirty.

Q. And what time would they be due in St. Louis according to that?

A. I couldn't tell you.

Q. You didn't know anything about that after they left you?

A. No, sir, not after they left me.

Q. Did you pack them in ice?

A. Yes, sir.

Q. Were you acting under instructions from any one, and if so, from whom?

A. From Mr. Teichmann, city chemist.

Q. Did you have written or verbal instructions?

1166 A. Written instructions.

Q. Did you follow those instructions?

A. Yes, sir.

Q. Strictly?

A. Yes, sir.

JUDGE SPRINGER: That is all.

THE COMMISSIONER: Did you give the stenographers your address? You know you will have to sign your evidence.

THE WITNESS: 1110 Mallinkrodt street. You can catch my address at the John Wall Commission Company, that is on Main and Market. THEO. G. RUFF.

1167 ED. BOCHERT, called as a witness on behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION, by Mr. Jeffries.

Q. What is your name?

A. Ed Bochert.

Q. Where do you live, Mr. Bochert?

A. 2514 North Market.

Q. St. Louis, Mo.?

A. St. Louis, Mo.

Q. State whether or not you ever got any samples of water for the city chemist's office of the City of St. Louis, Mo.?

A. I didn't gather any samples. I received the samples—I drove the wagon—I received the samples at the Chain of Rocks, got them from the collectors that were up there getting the samples and delivered them to the city chemist, and from the city chemist—

Q. You delivered them to the city chemist, where?

A. City chemist.

Q. In the City of St. Louis?

A. City of St. Louis.

Q. At his office?

A. At his office.

1168 Q. On Market street?

A. On Market—12th and Market.

Q. Now, when was that, that you did this work?

A. That was in 1900.

Q. How long did you work at it?

A. I don't exactly remember how long. It was about eight or nine months. Exactly I couldn't say how long.

Q. Do you remember about the time that you commenced?

A. It was in November, I think it was.

Q. You commenced in November 1900?

A. Yes, sir.

Q. And you continued then in that work for eight or nine months?

A. Yes, sir.

Q. You don't know exactly when you quit?

A. It was some time in October when they done away with it, or that it was all off.

Q. Well, that would be over a year. Was there any time between then, the time that you commenced and the time you quit, that you did not work?

A. No. I don't remember how long I hauled, but I know I did haul about that time.

Q. Where were you stationed?

1169 A. I was stationed at the city chemist's office, 12th and Market.

Q. Who brought those bottles to you, those samples?

A. There was a collector there by the name of Mr. Hart, Mr. Toohey, and after that there was a collector there by the name of Mr. Werner. That is at the Chain of Rocks, getting the samples.

Q. Now, then, what did you do with reference to their work?

A. Well, all I done was receive the samples from them and put them in the wagon and haul them down to the chemist's office.

Q. You hauled them down, did you?

A. I hauled them down to the chemist.

Q. What kind of bottles were they?

A. They were gallon glass bottles.

Q. Any small bottles?

A. And small bottles.

Q. How small were the small bottles?

A. They were about 4 or 8 ounce bottles, I don't remember now.

Q. What was in them, do you know?

A. I couldn't say what was in them.

Q. What did it look like?

A. It looked like water.

1170 Q. How were they fixed?

A. They were sealed and packed and put in wooden boxes—tin boxes—and ice around them.

Q. You brought them from the Chain of Rocks down to the city chemist's office?

A. Yes, sir.

Q. What did you do with them there?

A. Brought them upstairs and laid them all out on the table.

Q. What was done with them after that?

A. They would take one sample of each for themselves. Whatever they done with it I don't know. And the other one they would give me one sample back to deliver to the Washington University and to the St. Louis Medical College.

Q. That is, one sample of each?

A. Yes, sir.

Q. The small or large bottles, or both?

A. Both, large and small.

Q. Did you receive any of the samples in the express office?

A. Yes, sir.

Q. Where did they come from?

A. They come from Grafton, Peoria, Joliet, Lockport.

Q. Now, where did you receive those?

A. Received those some times from the Adams Express, sometimes from the Pacific.

1171 Q. How were they packed?

A. Same way.

Q. Packed in ice?

A. All packed in ice.

Q. Tagged and sealed?

A. Tagged and sealed.

Q. What did you do with them when you received them?

A. I brought them down the same as I did those Chain of Rock samples.

Q. They had the same disposition?

A. Same thing, and I shipped the empty cases out every morning.

Q. What was in those empty cases?

A. There was nothing in them but the empty bottles tha. I shipped away.

Q. Where did they come from?

A. From the city chemist's office. They had them all washed out, had the bottles all laying in a rack there washed out.

Q. That was the large bottles?

A. Large and small, both.

Q. Do you know whether the small ones were sterilized or not?

A. I couldn't say anything about that.

Q. They were simply put there for you to get?

1172 A. They were put there for me to get.

Q. And you took them?

A. I took them and put them in the boxes and shipped them to the different collectors.

CROSS-EXAMINATION, by Judge Springer.

Q. What time did you say was it that you obtained these bottles from the express office in this city?

A. Well, sometimes it was in the morning and sometimes in the afternoon, just the way the train was, if it was delayed, if the train was delayed, I got them in the afternoon, if it was not delayed I got them in the morning.

Q. What time in the afternoon?

A. Well, about two o'clock--two or three o'clock.

Q. Those that came from Grafton and above there, what time did those arrive?

A. They came in the morning.

Q. You got those the next morning after they were taken?

A. Yes, sir.

Q. What is your address?

A. 2514 North Market.

EDW. BOCHERT.

1173 ANTON KREH, called as a witness on behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT EXAMINATION, by Mr. Jeffries.

Q. What is your name?

A. Anton Kreh.

Q. Where do you live, Mr. Kreh?

A. I live at 2827 S. Jefferson avenue.

Q. St. Louis, Mo.?

A. St. Louis, Mo.

Q. How long have you lived in St. Louis?

A. I have lived all my life in St. Louis.

Q. State whether or not you ever got any water for the city chemist's office in the City of St. Louis?

A. Yes, sir, I did.

Q. Where did you get this water?

A. I got some at the Chain of Rocks and some at Alton.

Q. Now, when was this?

A. I started the second Monday in October.

Q. What year?

A. 1901. And I left the Department the first of December, 1901.

1174 Q. Now, you were working continuously at this work? Yes, sir.

Q. From the time you commenced until you left?

A. Yes, sir.

Q. State how often you gathered the samples of water?

A. Every day, Sunday included.

Q. Now, taking the work at the Chain of Rocks, state the particular place as near as you can in the river that the samples were gathered?

A. Well, we used to take a boat out every morning and go up, I think almost a mile, and we would start on the Missouri side about, say 30 feet, between 50 and 75 feet; we would gather there two large bottles and one small one. Then we would pull out to the center and get one large one, then we would go to the Illionis side almost between 200 and 300 feet and gather two large ones and one small one. Then we would pull down to the Intake tower and gather two large ones—one large and one small.

Q. That is at the Intake tower?

A. At the Intake tower.

Q. Do you remember the stage of the river at this time?

A. Well, no, I don't remember.

Q. Was it low or high?

A. Well, it was kind of low.

1175 Q. Low?

A. Low.

Q. In gathering these samples, on either shore, or on either side of the river, state whether or not you got them from the channel of the river or from the running water?

A. Well, we gathered them from the running water—no from the channel, in the channel as it was coming down stream.

Q. From the channel?

A. Channel, yes.

Q. Now, state whether or not you gathered any samples from the reservoir?

A. Yes, I gathered one bottle and one small bottle at the outlet at the reservoir.

Q. One large bottle?

A. One large bottle and one small bottle.

Q. At the outlet?

A. At the outlet.

Q. Now, did you get any from the well?

A. From the well?

Q. Yes?

A. At the outlet, right there.

Q. At the outlet?

A. Yes, sir, at the well.

Q. Just before it goes into the reservoir or basin?

1176 A. No, after it goes out.

Q. As it comes out of the reservoir?

A. As it comes out of the reservoir, and goes to the city.

Q. Now, how often did you gather these samples?

A. Up at the Chain of Rocks I gathered them for about two weeks.

Q. Yes, but how often; every day?

A. Every day.

Q. What time of the day generally?

A. Well, at the Chain of Rocks we would go out about eight o'clock in the morning.

Q. Now, what kind of an instrument did you use to gather these samples?

A. Well, we used to have an instrument that held the bottle at the neck and a stand underneath it held it tight, and then a spring held to the cork and as we would lower it about three feet under the water we would raise up the cork, and as soon as we saw it was full, drop it down, shut it down tight and bring the bottle up immediately and tag it.

Q. So you opened and closed the bottle under the water?

A. Under the water.

Q. About how far?

A. Well, about three feet under the water.

Q. The full length of the instrument?

1177 A. Full length of the instrument.

Q. Now, you brought those bottles up—what did you say you did?

A. We put a tag on where it was taken from; then we would take the bottles and bring them over to the little office we had there and seal them and pack them into boxes, and put ice in between them, and pack them and ship them on the wagon to St. Louis.

Q. Now, then, what did you put on the tag?

A. We put on the tags the Missouri side, center. Illinois side—

Q. It depended on the sample?

A. It depended on the sample.

Q. In other words, you put the place where the sample was collected?

A. Yes, sir.

Q. On the tag?

A. Yes, sir; took the temperature of the water.

Q. Did you put that on?

A. Yes, sir, and the air temperature; we would put that all on the tag.

Q. Where did you get the thermometers that you used?

A. Mr. Teichmann gave us the thermometer.

1178 Q. Who is Mr. Teichmann?

A. City chemist.

Q. Of the City of St. Louis?

A. Of the City of St. Louis.

Q. Now state whether or not you wrapped anything around the smaller bottles?

A. Yes, sir; I wrapped some tinfoil.

Q. Then what did you wrap around them?

A. Then I tied the rag around it and tied it up tight, so that nothing could be destroyed while it was going—sealed the string.

Q. Sealed the string?

A. Yes, sir.

Q. Where did you get the bottles used in collecting these samples?

A. At the city chemist's office, between Eleventh and Twelfth on Market.

Q. And you turned them over to the water carriers?

A. Yes, sir.

Q. That brought them down?

A. Yes, sir.

Q. What time would he get up there?

A. He would get up there about half past ten, ten o'clock and so on—well, sometimes half past nine.

Q. You would have them ready for him when he got there?

1179 A. I would have them ready for him when he got there; I stayed there with the box until he came, and put them on his wagon and let him go ahead.

Q. Now, then, while gathering at Alton, state the particular places in the river that you gathered the samples of water at Alton?

A. Well, I would go to Alton every morning; get up there about nine o'clock and would take a boat and go up about a mile above. I would go up to the waterworks and at the dike there, and pull up above the upper portion of the dike and there about 100 feet from the Illinois side I would collect a large bottle and a small one underneath the water, and would do the same thing about one hundred feet on the Missouri side, a large and a small one.

Q. Now, you made the same disposition of these bottles that you did with those others at the Chain of Rocks?

A. Yes, I brought them down myself; I didn't ship them.

Q. And you wrapped them and sealed and tagged them?

A. Yes, sir, wrapped them and sealed and tagged them.

Q. And put on the tag what?

A. The temperature of the air and where the water was collected.

Q. And the name of the collector?

1180 A. And the name of the collector.

Q. That would be your own name?

A. That would be my own name.

Q. And you made the same disposition of those that you did with the others?

A. Yes, sir, I also used to get five bottles, skimming the top of the river.

Q. At Alton?

A. Yes, sir, at Alton; go right straight across the river in one straight line.

Q. And you made the same disposition of those?

A. The same disposition.

CROSS-EXAMINATION, by Judge Springer.

Q. You stated that you took some samples on the Illinois shore above the St. Louis Intake. Will you describe that place as near as you can, and the distances from the Illinois shore?

A. Well, of course I couldn't get exactly to the feet of it. My idea would be about 100 feet.

Q. From the Illinois shore?

1181 A. Yes, sir, between 100 and 75 feet.

Q. How far would that be above a line drawn across the river at right angles to the current, through the Intake?

A. Well, that of course—I couldn't get down to the exact number of that.

Q. Your best judgment, of course?

A. Well, I would say it would be about four hundred, five hundred feet, something like that—six hundred.

Q. Six hundred feet?

A. Yes, sir.

Q. Above a line drawn through the Intake from shore to shore?

A. From shore to shore, at the Intake tower; I would take it right in the center.

Q. I am speaking of that taken on the Illinois shore?

A. Well, that would be about six or seven hundred feet—I couldn't tell exactly—from the shore.

Q. I thought I understood you to say you went up the river about a mile?

A. I did go up the river about a mile to get the first bottles on the Missouri side and on the Illinois side.

Q. I am speaking about the Illinois side. How far was that above the intake?

A. That was about a mile.

Q. Above?

1182 A. Above.

Q. From the appearance there could you tell whether that water had come from the Illinois River, or the Mississippi River?

A. Yes, sir, because the Missouri River was very muddy, and the Illinois water was clear.

Q. The Illinois water was clear?

A. Yes, sir.

Q. Well, was this apparently Illinois water that you took over on that side?

A. Yes, sir, it was Illinois water we were taking.

Q. And you could see the difference, you state, by the appearance of the water?

A. Yes, you could see the difference.

Q. Did you notice that difference where you took these samples at Alton?

A. Well, Alton, it was the same there; it was both clear.

Q. How?

A. They were both clear there because it was just coming all the way from the Mississippi, all the way down, you know.

ANTON KREH.

1183 FRED B. WENZEL, called as a witness in behalf of the complainant, being first duly sworn by the Commissioner, testified as follows:

DIRECT-EXAMINATION, by Mr. Jeffries.

Q. What is your name?

A. Fred B. Wenzel.

Q. Where do you live, Mr. Wenzel?

A. 4653 Michigan avenue.

Q. St. Louis, Missouri?

A. St. Louis, yes, sir.

Q. How long have you lived in St. Louis?

A. Twenty-seven years.

Q. What were you doing in February, 1900?

A. Working for the St. Louis Water Department.

Q. What particular work were you engaged in?

A. I was at that time collecting samples.

Q. Where—samples of what?

A. Water, in the Illinois and Mississippi Rivers.

Q. Where?

A. I was stationed at Grafton.

Q. Now, then, what time did you gather these samples?

1184 A. I would gather them about nine o'clock in the morning; I would start at nine o'clock and I would finish about—

Q. Now, during what time of the year—the date of your employment in this work?

A. It was either on the 5th or 6th of January, 1900, that I started, and I continued until the last day of March, or last day of February, 1900, and came back to the city then and stayed there.

Q. You discontinued gathering water?

A. I discontinued gathering water, yes, sir.

Q. Now, then, state the particular place in the river that you gathered these samples at Grafton; that is, in the Mississippi River?

A. The Mississippi River—why, I guess I had better tell you the trip I would take every morning, the regular route—

Q. Yes?

A. I would start away from the hotel about nine o'clock in the morning, and during the weather that would allow us taking a skiff or boat, we would pull up the Illinois River in the neighborhood of say three or four miles to a place there they called the Ferry; we would pull above the ferry about half a mile, and we would take a sample—the first sample.

Q. What ferry is that, do you know? Wheeler's Ferry?

1185 A. Wheeler's Ferry. We would take two large bottles and a small bottle.

Q. Well, can you—now how did you take these samples?

A. We was furnished a machine by the city chemist's office.

Q. Now, how deep under the surface of the water would you take them?

A. We would leave the machines down about three feet, or the instrument.

Q. Tell what you did when you got this sample, what did you do with the machine?

A. The machine was fixed so that we could place a bottle. It had a stand there, there was an attachment, or wire tied to the cork. Just as soon as we got the bottle down into the water we would raise up the cork—pull up the cork—

Q. In other words, you opened the bottle?

A. Opened the bottle underneath the water.

Q. Now, then, how would you close it?

A. We would close it underneath the water, just as soon as we seen we had it full, we could just about guess after you had taken a few of those samples, a man could just about tell the time that the bottle would be filled.

Q. What did you do with it after you took the samples; after you drew them out of the river?

A. Drew them up to put them in the boat, put a tag on
1186 them and kept the bottles separate so we would know
where we took the sample.

Q. What did you do with the bottle?

A. Put it in the boat; put it in a box we had—we had tin boxes with excelsior and we packed those two large bottles in there.

Q. Did you wrap them with anything?

A. Not at that time. We couldn't wrap—well, sometimes we wrapped them when the water would permit, but sometimes it was so cold that you couldn't—at that time it was cold—so cold that your fingers would get numb on you.

Q. What did you finally do with them in the way of wrapping and packing them?

A. Took them down to the hotel then, just as soon as I could, all the samples together, and put cloth around the large bottles, tied them and then sealed the strings, the ends.

Q. What did you do with the small bottles?

A. I put tinfoil around the small bottles.

Q. And then the tag?

A. And then the tag, yes sir.

Q. And then sealed them?

A. And then sealed them.

1187 Q. What did you put on the tag?

A. We put on the tag the date, place,—the location and—

Q. These places where the sample was taken?

A. These places where the sample was taken, yes sir, and the temperature of the air and my name.

Q. Temperature of what?

A. Temperature of the water.

Q. And the temperature of the air?

A. And the temperature of the air.

Q. And your name?

A. And my name.

Q. Then what did you do with them?

A. We would see that they were in first class shape for shipment, pack the boxes and lock them. These tin boxes, we would only take them with us after we got the samples. After we had the bottles in the tin boxes then we would have another wooden box for these tin boxes. Set these tin boxes in the wooden box and secure them and deliver them to the express company and ship them down to St. Louis to the City Chemist's office.

Q. Now, then what particular place in the Mississippi river did you get samples?

A. We would pull up about three miles or four miles above
Grafton, before where the Mississippi river and Illinois
1188 river come together, and I would get a sample there, and
I would do the same thing I done at Illinois.

Q. In other words, it would be three or four miles above the mouth of the Illinois river?

A. Exactly, it would be about 3 or 4 miles above the mouth of the river.

Q. What kind of samples did you get there?

A. I got one large and two small.

Q. And you made the same disposition of those?

A. Made the same disposition of those.

Q. And you got them in the same way?

A. I did, sir.

Q. How often did you get the samples?

A. Once a day.

Q. Sunday included?

A. Sunday included, yes.

CROSS EXAMINATION,

By Judge Springer.

Q. At what time in the day did you ship these samples to St. Louis?

A. I would deliver them to the express company in the neighborhood of 3 o'clock every day.

Q. What time would they leave Grafton?

1189 A. They would leave there about 5:30.

Q. That day?

A. That day.

FRED B. WENZEL.

1190

WILLIAM TOOHEY,

called as a witness on behalf of the complainant, being first duly sworn by the Commissioner, testtified as follows:

DIRECT EXAMINATION,

By Mr. Jeffries.

Q. What is your name?

A. William Toohey.

Q. Where do you live, Mr. Toohey?

A. 2323 Olive St., St. Louis, Mo.

Q. How long have you lived in St. Louis?

A. Nine years.

Q. State whether or not you ever got any samples at the Chain of Rocks.

A. I did for about five months in 1900.

Q. Who did you gather them for?

A. The City Chemist.

Q. Of the City of St. Louis?

A. Yes sir.

Q. When did you say you gathered these samples?

A. I am not positive, it was in the first of June, I believe until the 15th of October.

Q. What year?

1191 A. 1900.

Q. Now, what was the character of samples of water that you gathered with reference to quantity?

A. Well, I had every morning—well not every morning, I might miss one or two mornings, but every morning that I did go out, I went up about a mile on the Missouri side and took two samples there of the large bottles and one small one. I crossed the river then as near that point as we could possibly get opposite across the river going up and got nearest opposite that point as we could possibly get and took the same number of samples there. Then dropped down to the Intake tower and took the same number there. Then go in and take two samples out of the basin and one at what thy call the screen house--I don t know just exactly what it is, they call it the screen house.

Q. You took one sample there?

A. Two samples there.

Q. One each?

A. One each.

Q. What did you say the quantity of the large bottle was?

A. About a gallon.

Q. And the small one?

1192 A. Well, about four or six ounce bottles, about that, along there.

Q. Give the means that you used in selecting these samples, the instrument, what kind of an instrument?

A. They had an instrument made out of gas pipe It had a spring on it. They would set the bottle in it and fasten it and put the cork into this little spring and close it. Put that down in the water where they had it marked on the machine, 3 ft., and after they got it down that far they would pull the cork out and as quick as the bubbles stopped coming up pushed that back down again.

Q. Why did you wait for the bubbles to stop?

A. Well, that was natural that it was filled then?

Q. When you brought it up what did you do?

A. We took and put heavy pieces of linen, I guess it was, took and wrapped that around it and tagged it, put a tag on it—

Q. You put the tag on it?

A. I put the tag on.

Q. What did you put on the tag?

A. The time it was taken.

Q. What else?

1193 A. Temperature of the water and the temperature of the air.

Q. Anything else, did you put your name on?

A. Yes, I never put my name on. Mr. Hart was with me; he always wrote the tag.

Q. Mr. Hart was with you?

A. Yes, he always wrote the tag. I would tie them on.

Q. You say you gathered them with the exception of one or two days, every day?

A. Sundays and all.

Q. Were samples gathered those days that you were not there?

A. Yes sir.

Q. And they were turned over to Mr. Hart?

A. Two or three times I would miss the train and I could not get out there in time. I always tried to get the water at a certain time in the morning.

Q. How long would it take you to get them down to the City Chemist's office?

A. Well, we would take the water on the road and carry them down there, the driver would be there at half past nine, and we would have everything ready, and he would rest his team a few minutes and load up the wagon and he would start right back in again. When he didn't bring the water in on the wagon we would ship it in on the train in the afternoon.

1194 Q. What did you put around the small bottles?

A. We tied them up and put tinfoil around them and packed them in in tin boxes with ice and then packed the tin boxes in the wooden box.

Q. And you tagged those the same way?

A. They were all tagged, every bottle.

CROSS-EXAMINATION

By Judge Springer.

Q. When did you say you took these samples and at what places?

A. On the Missouri side; on the Illinois side; at the Intake tower; at the settling basin and what they they call the screen house. That is the only name I ever heard given it. It is where all the water goes into the water works.

Q. What period of time did you cover when you were taking these samples?

A. From June 1st about until October 15th.

Q. 1900?

A. 1900, yes, sir.

Q. What was the stage of the river at that time, of the water in the river?

1195 A. Well, the stage in which way, rough?

Q. High water or low water?

A. Well, no not very high.

Q. Ordinary stage?

A. Ordinary stage, yes.

Q. How far from the Illinois shore was it that you took the sample to which you have referred as having been taken on the Illinois side of the river?

A. How far from the shore we would take the sample?

Q. Yes?

A. Well, I never measured, but I would naturally think we never went any closer than 20 or 30 ft.

Q. Never went closer than 20 or 30 ft.

A. No sir.

Q. Did you observe the appearance of the water at that point as compared with the water on this side of the river, on the Missouri side?

A. Yes, sir, naturally.

Q. Well, could you tell whether that water had come from the Illinois river or from the Missouri river?

No, I couldn't.

1196 Q. Was there any difference in color or appearance?

A. Yes sir.

Q. What was it?

A. The water that we got on this side was muddy and dirty looking and the water on the Illinois side was clear looking.

WILLIAM TOOHEY.

1197

DR. AMAND NICHOLAS RAVOLD

resumed the stand for further direct examination by Attorney General Crow, and testified as follows:

Q. Do you remember the last question, Dr. that was asked you?

A. No, sir.

Q. Wasn't it about Lausen?

A. No, I think it was about Plymouth. We were through with Lausen and we had begun with Plymouth, Pa.

Q. Well, now in the first place I will ask you if you are familiar with the history of that epidemic at Plymouth, Pa.?

A. I am familiar with L. H. Taylor's report to the City Board of Health of Plymouth, Pa. I never was in Plymouth.

Q. Well, have you investigated that epidemic as a bacteriologist and as a physician also?

A. More as a hygienist. I was looking over the classic cases in literature epidemics of typhoid fever caused by dejecta from a typhoid fever patient getting into the water supply.

Q. Well, you have investigated that epidemic then, from a sanitary standpoint and from the standpoint of a hygienist, and from the standpoint of a bacteriologist?

1198 A. Yes sir.

Q. Now, I will ask you to state if you know, as a bacteriologist and as a hygienist, what is assigned as the origin of that epidemic?

A. Why, it seems from the report—

ATTORNEY GENERAL HAMLIN: Doctor, as I understand it, you get this from a report.

A. I got it from a report, yes sir.

ATTORNEY GENERAL HAMLIN: That is objected to as not being relative and proper evidence in support of this bill.

ATTORNEY GENERAL CROW: Well, of course that is coming, that evidence, we can put it in the record.

Q. All right, Doctor, go ahead.

A. Plymouth is a small town in Pennsylvania on the Susquehanna River. It has two sources of water supply. Water is pumped from the Susquehanna river in the winter time, but not in the summer time; during the spring and summer time water is taken from a reservoir system that is situated in the hills above the town.

There are four reservoirs, one above the other. The lowest reservoir, which is the distributing reservoir, holds 300,000 gallons, the second one above holds 1,700,000 gallons, the third, 3,000,000 gallons and the fourth 5,000,000 gallons.

1199 In 1885 a typhoid fever epidemic broke out in this town

of some 8000 inhabitants, the first case appearing on April 9, 1885, and in a very short time there occurred in this town, 1104 cases of typhoid fever with 114 deaths, a death rate of 10.3 per cent. Dr. Taylor investigated the epidemic and discovered this fact, that a man living above the reservoir on the hill had visited Philadelphia in December and no doubt there contracted typhoid fever. He came home and was sick in January with diarrhea, fever and other symptoms of typhoid fever and was sick for quite a while. His dejecta urine and feces were thrown out upon the side of the mountain towards the reservoirs. Here in the ice, but exposed to the sun, it remained frozen until March. Early in March when the spring rains began and the thawing of the ice on the mountains occurred, the water ran down, containing the feces, into the reservoir, and when the superintendent of the reservoir found the lowest reservoir full enough to permit him to turn the water into the water supply system of the town, the pumping was stopped from the Susquehanna river and this water supplied. Within an incubation period of from two to three weeks thereafter, April 9th the first case of typhoid appeared, and the epidemic followed. The amount of water in the reservoir was probably about 5,000,000 gallons and
1200 was infected by the discharges of one person.

Q. What was the population of that town?

A. 8000.

Q. How many cases were there?

A. 1104.

Q. How many deaths?

A. 114.

Q. Have you ever been to Hamburg, Germany?

A. Yes sir.

Q. Do you know whether or not they have a water filter there?

A. Yes sir.

Q. For their city water supply?

A. Yes sir.

Q. What is that water filter?

A. The water is pumped from the river Elbe, the Norder Elbe.

Q. The what?

A. The North Elbe. And first it is carried into a series—

or rather two sedimentation tanks, very large ones. I think each tank is about 1000 feet long by 300 or 400 feet wide. There
are two of these tanks, these sedimentation tanks or res-
1201 ervoirs and together with the filters are on an island in
the river. In the reservoirs the water is allowed to settle from 24 to 36 hours. It is then carried across a series of sand filters. These sand filters probably—they are of different size and forms—

Q. How are they constructed?

A. They are rectangular reservoirs of masonry and cement floors with a drain through the middle and lateral veins running into it.

Q. On a small, level bed?

A. No, that is on the bottom of the reservoir. The filters beds are made of layers of rather large rocks or boulders, heavy sand, coarse sand and very fine sand finally comes on top of these sand layers, making a bed of 40 to 50 inches in depth.

Q. In thickness?

A. In thickness, yes. Filtered water is admitted slowly from below.

Q. From below?

A. Yes, sir, slowly admitted from below until the sand
in this whole mass of rock, etc. is wet, saturated with
1202 water. The water is allowed to cover the surface of it.
Then the unfiltered water is run in, so as not to disturb the filter bed too much and anywhere from 30 to 50 inches of water are allowed to stand on top of the sand. The water that first passes through the filter is bacteriologically practically the same as that which runs into it, that is, contains the same number of bacteria.

Q. They each come from the settling basins?

A. They each come from the settling basins, but after a time the filter begins to filter, to do as I have explained before, by the action of the bacteria upon the sand grains. Each bacterium has a little gelatinous capsule on its cell wall which permits it to adhere to a grain of sand or to one another and in this way a glue-like mass forms in the sand layer of the filtering tank, or as the Germans call it, a smutzdecke is formed. This bacterial layer now catches all bacteria and solid particles that are in the water as it passes through the filter and holds them tenaciously.

The water passes through, the filter having very few bacteria remaining in it. It now passes from the filters into what is called a clear well, at Hamburg. The clear well is covered. Every few hours a sample of this water is taken, for bacteriological examination.

1203 Q. What is that well, is it in the open or is it walled?

A. Oh, it is walled.

Q. With masonry?

A. With masonry. The water taken from this clear well, according to the German law, must not contain more than 100 bacteria per cubic centimeter. If it does the filter is not working properly and is put out of use. I was told that the water in this clear well as a rule contained anywhere from 30 to 50—to as high as 70 bacteria per cubic centimeter, and these were mainly water bacteria that had grown down through the filter.

These filters are very fine. It is a very beautiful system. They are what are known as open filters, not covered, as in Berlin.

Q. The wells are not covered?

A. No, the filter basin is open.

Q. Where the sand filtration occurs it is not covered?

A. No, sir.

Q. Now, just to go back a step. That number of bacteria found per cubic centimeter in the wells, is considered harmless, is it?

A. Yes, they are ordinary water bacteria that grow
1204 in the lower layer of the filters.

Q. But I mean that number is harmless?

A. That number is harmless. The number of bacteria is an index, it is a bacteriological index to the efficiency of the filter.

Q. As to whether or not the filter is efficient?

A. Yes sir.

Q. Now, do you know what has been the effect of that filtration upon the typhoid death rate, etcetera in the city of Hamburg?

A. Yes.

Q. Well, what has been the effect of that?

A. Well, previously—these filters were put in operation in May, 1893 after that cholera epidemic which I related in the last examination, in 1892. The City of Hamburg worked night and day until these filters were completed and then the difference before and after the use of filtered water in the typhoid death rate, was very markedly shown. I have some figures here graphically showing this fact.

Q. What is that chart that you have?

A. I have a chart here which I made of the death rate from typhoid fever in Hamburg. I will read it to you.

1205 Chart showing the course of typhoid fever in Hamburg before the filtration of the municipal water supply, deaths per 100,000.

On the left hand side of this chart are figures ranging from 0 to 100. This represents deaths per 100,000 of population.

Along the lower margin are written figures in ink, the years from 1880 to 1898. Then I have columns here in black with numbers on top of the columns so that deaths per 100,000 can be read from the left hand side of the map, and also from the figures written on top of each column.

Q. In what colors are the columns represented?

A. The column is in solid black, we find that from 1880 to 1893, in May, the average typhoid death rate was 39.7 per 100,000 before the water was filtered.

For the years 1893 to 1898 the average death rate after this filtration of the water supply, is nine per 100,000.

Q. Have you got the difference, being a difference of how much?

A. Oh, the difference between 39.7 and 9.

Q. About 30 per cent?

A. Oh, no, not per cent.

1206 Q. About 30 to the 100,000?

A. The percentage would be different entirely. It is a great per cent.

Q. Now, you made that map?

A. I made this map, sir, from statistics that I received.

ATTORNEY GENERAL CROW: I want to offer that map in evidence.

JUDGE SPRINGER: No objection.

Said map received in evidence and marked by the Commissioner "Complainant's Exhibit 21, Frank S. Bright, Commissioner."

THE WITNESS: I received through Doctor Seibert of New York, in the New York Medical Journal, information that in 1901 the typhoid death rate in that city was one death to 60,000 of population, so that would be not quite two deaths per 100,000.

Q. In Hamburg?

A. In Hamburg, yes. So if that were marked on this map it would be a very small column showing the efficiency of filtration against water-borne diseases.

Q. Now, did you personally investigate this filtration plant?

A. Yes, I went there and saw it.

Q. Now, are you familiar with the water supply of London?

A. Yes sir.

Q. Have you ever investigated it?

1207 A. Well, I went up to Lambeth and Hampstead. I travelled up the river Thames and have seen—

Q. Now, wait a minute? Did you investigate it as a water expert, bacteriologist and hygienist?

A. I did no bacteriological work on it. I went up to look at the filters, the character of the filters from a sanitary standpoint.

Q. From a sanitary standpoint?

A. These are the oldest filters in the world, or rather oldest sand filters.

Q. When were they put in?

A. Oh, they were put in as early as 1829.

Q. How were they made, similar—

A. Very similar, yes, to the Hamburg filters. Some of them are circular, some being square. The Hamburg filter is rectangular in shape and from 1 1-2 to 2 acres of area, while some of the filters on the Thames are smaller.

Q. How many of the filters of London did you investigate?

A. I saw those at Lambeth and at Hampstead.

Q. How many water supplies have they?

A. Oh, there are a number of water companies that 1208 supply water to London, both filtered water from the River Thames and from the river Lee and then they have water from deep wells. I didn't go to the river Lee. I travelled up the river Thames in a boat just to see the sand filters, to know that they were there.

Q. Where was the water taken from?

A. From the river Thames, pumped from the river Thames.

Q. Then it goes through a process something similar to the one you have described?

A. Something similar to this one.

Q. Now, do you know where the outfall of the sewage of the city of London is?

A. I know a good deal is discharged into the river Thames, and much of it is carried out to sea.

Q. Have you any statistics in regard to the effect of filtration plants on the typhoid rate in London?

A. I have not.

Q. You have not?

A. No, but it is very low.

Q. Well, was it decreased?

A. Oh, there was a great decrease following the introduction of good water.

1209 Q. Are you familiar with the water supply of the City of Vienna?

A. Yes sir.

Q. What is that water supply, where is it taken from?

A. The water supply of Vienna is taken from the Springs in the Schneeberg mountains; they are 67 miles away from the city.

Q. Away from the city?

A. Away from the city, southwest, a mountain stream is brought into the water supply of the city.

While I was in Vienna Mr. Max Judd of this town, was the United States Consul there and he did everything for my comfort. I went over the water supply and learned that they were also putting in filters to filter some of the Danube water, the river Danube passes through the city—the beautiful Danube is anything but a beautiful blue river. It is a very dirty looking mess, something like the Missouri river water. And they were intending to filter this water with what is known as the Wormse or Plaque filters. That is another kind of a filter—Fisher's plaque filters.

Q. What kind of a filtration plant is that?

A. It was not in operation when I was there.

1210 Q. Have you ever seen one?

A. Oh, yes. There is one in East St. Louis in operation.

Q. What kind of a filter is that?

A. The plaque is made up of sand and pounded glass. Those ingredients are mixed in varying proportions heated and molded so that a more or less porous material is obtained, that is, the finer the glass, the finer the porosity of the material. They are moulded into Plaques, into rectangular bottles, say about 3 feet square and about 8 feet deep. The interior of this plaque is hollow. It is a hollow square. A pipe is fastened into the top of the plaque, a hole being left for the purpose, clamped down snugly on a rubber gasket and the plaque is ready to be used as a filter. A series of these plaques are emersed in water in a reservoir and the pressure ot the water drives the water—the pressure in the reservoir drives the water through the walls of filter into the hollow space in the center of the rectangular plaque then out through the tube in the top and it is conducted away by a series of pipes.

1211 The efficiency of the filtration is due to the bacterial coat of slime that grows on the outside surface of this rectangular plaque, the same as in sand filters.

Q. On the same principle as the sand filter?

A. The very same principle exactly.

Q. The result would be in a turbid stream, that that filter would not be a success.

A. No, sir it is not a success in this water at all.

ATTORNEY GENERAL HAMLIN: This East St. Louis one you say is not a success?

A. No, I say this: there is a firm here, I have forgotten their name. It is not the East St. Louis Filter Co., but a firm here in town that own a manufactory in East St. Louis, and it is owned by St. Louis people, Stieffel and somebody else, and known as the Wormse Filter Company. They have an office down on Locust Street. They manufacture the plaque in East St. Louis and have a plant over there to show the method of working the filter. It is there that I saw it at work, within the last two years.

1212 ATTORNEY GENERAL CROW: Did you go and investigate the lake from which Vienna draws its water supply?

A. No, it comes from a spring high in these mountains.

Q. From a spring?

A. Yes, sir.

Q. Is the spring above the agricultural line?

A. Yes, sir.

Q. No farms or residences whose sewage is discharged into it?

A. No, sir, it comes right out of the mountain.

Q. The outfall would be towards the spring.

A. No, sir.

Q. Do you know anything about what the death rate is in Vienna from typhoid?

A. Yes, very low.

Q. What is it per 100,000?

A. Well, I have got some statistics here. Do you want these now?

Q. Well, you might give me that for Vienna, as long as we are on that.

A. Vienna, 1890, deaths per 100,000 from typhoid fever, 9.

Q. Now, doctor, have you ever been to the city of Berlin in Germany?

A. Yes, sir.

Q. Did you investigate their water supply from a sanitary standpoint?

A. Yes, sir.

1213 Q. What kind of water supply have they?

A. They have a filter water supply.

Q. From whence does the water come?

A. The water comes from—Berlin has two filtration plants, the old works—the Stralau works—are on Lake Havel, and inasmuch as they were not in operation when I was abroad in 1896, I did not go out to them, but I took a boat on the river Spree and went up to the Friedrichshagen works on Lake Muegel, and there went over that filtration plant. They have a very great many filters at this place. The Friedrichshagen works, I think, were put in operation in 1892. They filter the water from Lake Muegel. This Lake Muegel is practically an enlargement of one of the branches of the river Spree, probably two or three miles long by a couple of miles wide. They say it is 26 feet deep. The little boat I was on ran through it. The water is pumped from this lake and is filtered through a series of filters, sand filters, and these filters at Friedrichshagen are covered. They cover the filters to keep them from freezing in the winter time; some 44 filters are at this point.

Q. Well, do you know anything about the death rate from typhoid in the city of Berlin?

A. Yes, sir.

Q. Well, what is it?

1214 A. Per 100,000 in 1890 we had nine.

Q. Do you want me to read all of these figures?

Q. No. Now, when was this filtration plant put in?

A. I think the first, the Stralau Works, were put in about 1856; the Friedrichshagen Works were put in in 1892.

Q. Do you know what the effect of the filtration was upon the typhoid rate?

A. Yes, sir.

Q. Just give it to me, will you?

A. Why, before 1856, the typhoid death rate was 1 to 900 among the inhabitants of Berlin.

Q. 1 to 900?

A. 900. 1843 to 1853 the typhoid death rate was 1 to every 900 of the inhabitants of the town.

1853 to 1893, that is with the old works, the Stralau Filtering plant, before bacteriologists had really taken hold of this subject of filtration; before we understood it, in other words, what it meant and how to be properly conducted, the typhoid death rate was 1 to 900. But Berlin in the meanwhile had some shallow wells from which some of the water supply of the town was taken, but from 1892 on when the new works were put in—

1215 Q. With all water filtered?

A. With all water filtered.

Q. For the public water supply?

A. For the public water supply. Here the typhoid death rate was high, great for a number of years, and we find that in 1900, it is recorded that there was one typhoid case to over 50,000 inhabitants, or one or two cases to every 100,000 of the population. That is a remarkable reduction.

Q. Have you ever investigated the water supply of Edinburgh?

A. Edinburgh?

Q. Yes?

A. I was in England for a time, but I did not investigate the water supply. There were too many other interesting things there.

Q. Did you investigate the water supply of Paris, France?

A. Yes, sir, I did.

Q. Do you know whether or not there is a filtration plant there?

A. Yes, they have some filtered water there, besides water is brought a long distance from springs in the mountains, as high as 100 miles away.

Q. One hundred miles from the city?

1216 A. Yes, sir. Then water is pumped directly from the Seine. In some houses you will see two faucets. One faucet has a sign on it "This is dangerous. Do not drink it." The other is the good water, which has been filtered or has been brought in from the mountains.

Q. What is the system of filtration they have?

A. Sand filters.

Q. Pretty much the same as the Hamburg and Vienna and Berlin filters?

A. Yes, sir.

Q. Any other city of continental Europe whose filtration plants you have investigated?

A. No; those are the only ones that I have investigated. Hamburg I studied particularly on account of its remarkable experience with cholera.

Q. Are you familiar with the history of the typhoid epidemic in Catterham, England?

A. Well, I am familiar with the report of the man who made this investigation, Dr. Thorne Thorne—of Catterham and Red Hill—the two towns that were affected by one water supply.

Q. Well, what is supposed to have been the origin of that?

A. In 1879 a typhoid fever epidemic broke out in these 1217 two towns. On January 19th, 1879, the first case of typhoid occurred in Catterham. Two weeks afterwards it reached its height, and at the end of a month it practically ceased.

This epidemic was investigated very carefully. I find that in six weeks, while it lasted, there were 352 cases and 21 deaths.

It seems that the water supply of Catterham and Red Hill was supplied by a water company which pumped water from deep wells, and two of the wells were somewhat near together, and it was decided to connect them with a tunnel or an adit, as they call it. They spell it A-d-i-t—it was a small tunnel for the purpose of connecting these two wells together.

Among the workmen at work in this adit was one man who had diarrhoea, and he worked in the tunnel from January 5th to 20th. He had diarrhoea all this time and on the 20th was so sick that he was taken to his bed, and remained there. Being a skilled workman, he was kept at work and his discharges were carried up in a bucket that carried up rock.

Now, it seems that the water company knew of his 1218 diarrhoea and insisted that when his bowels moved, he must use one of the rock buckets; that they must be discharged into one of the large buckets. Now, it was a liquid discharge, and when one of these buckets filled with rocks was lifted through one of the wells, the discharge leaked out and fell into the water. It is quite interesting to hear that on January 5th he was at work there with a diarrhoea and that on January 19th the first case of typhoid occurred. That incubation period of two weeks is quite interesting, showing the period of time elapsing before the earliest case occurred, while the later cases came in within three or four weeks after the water was taken, which shows the incubation period of typhoid in this particular case—Red Hill and Catterham both suffered. Catterham contained 558 houses and 419 took water from the common supply. Red Hill contained 917 houses, and 824 took

their water from this common supply, and it was in these houses the typhoid occurred in the two towns. I think it is in Caterham that there was an insane asylum having two thousand inmates, none of whom were sick, and a military barracks with a great many men, none of whom were sick. They had
1219 an independent water supply; used water from their own wells.

Q. Now, are you familiar with what is known as the Bond street pump epidemic?

A. Yes, the Bond street pump—I chased all over London to find it. I wanted to find the Bond Street Pump, or some signs of it, at least I was in hopes there would be a placard on a building to show where that pump formerly stood, because it has a remarkable history.

Q. Did you locate the place?

A. Yes, I found Old Bond street, but not the pump, nor any signs of it remaining

The Bond Street Pump cholera epidemic in London was investigated very carefully. It was found that discharges from a case of cholera infected the well and 700 cases of cholera followed the use of the water. The pump was in a well sunk into the ground on Bond street and the water was used by a number of people living in that neighborhood, and was considered a good drinking water because it sparkled and tasted very nicely. When this cholera epidemic was investigated by the authorities it was found that close to the well was a cess
1220 pool which leaked into the well.

The walls of the well were broken and allowed the liquids from the cess pool to enter almost directly into this well. A case of cholera existed in the house which used this cess pool and the dejecta from the patient were thrown into it, and ran thence into the well water. 700 cases of cholera resulted from drinking this water in the immediate neighborhood of the well and several at a distance. It was found that an old lady who lived at Hampstead had a bottle of this well water sent to her every day, and that she became infected from drinking the water and also a niece who was visiting her, both died.

Q. Now, have you got the statistics of the mortality from typhoid in Rotterdam?

A. Yes sir.

1221 Q. Will you please read them if you have them—where did you get them from?

A. I got these Rotterdam statistics from Hill's Work on Public Water Supplies.

Q. Well, now give them to me with the years, will you?

A. This water supply is filtered, the water being taken from the river Rhine and the river Maas, and it is filtered by sand filtration. Now, do you want the figures from the various cities?

Q. Yes?

A. This is a table—Foreign Cities, deaths per 100,000.

ROTTERDAM.

1890, 6 cases,
1891, 4 cases,
1892, 6 cases,
1893, 5 cases,
1894, 5 cases,
1895, 2 cases,
1896, 12 cases.

MUNICH, BAVARIA.

ATTORNEY-GENERAL CROW: This is all per 100,000?

A. Yes, I say, deaths per 100,000 for foreign cities and we had Rotterdam first. Now comes Munich. The Munich 1222 water supply is brought from Mangfall Valley from springs in the mountains, about 38 miles away.

Q. You have been there, have you?

A. Yes, sir.

MUNICH.

1890, 8 cases,
1891, 7 cases,
1892, 3 cases,
1893, 15 cases,
1894, 2 cases,
1895, 3 cases,
1896, 3 cases.

BERLIN.

1890, 9 cases,
1891, 10 cases,

1892, 8 cases,
1893, 9 cases,
1894, 4 cases,
1895, 5 cases,
1896, 5 cases.

VIENNA.

1223 Vienna, as I said before, takes its water supply from springs in the Schneeberg mountains.

1890, 9 cases,
1891, 6 cases,
1892, 8 cases,
1893, 7 cases,
1894, 5 cases,
1895, 6 cases,
1896, 5 cases.

That is the foreign cities. Do you wish me to compare it with—

Q. Well, now, have you got a comparative list there of American cities that use unfiltered water?

A. Yes, sir, in the United States?

Q. Yes?

A. I have Chicago, lake water unfiltered:

1890, 92 cases,
1891, 154 cases,
1892, 106 cases,
1893, 45 cases,
1894, 31 cases,
1895, 32 cases,
1896, 46 cases,

1224 That is, per 100,000 of population.

For Pittsburg, unfiltered river water:

1891, 100 cases,
1892, 100 cases,
1893, 111 cases,
1894, 56 cases,
1895, 77 cases,
1896, 61 cases.

LOUISVILLE, KENTUCKY.

Unfiltered river water.

1890, 88 cases,
1891, 81 cases,
1892, 72 cases,
1893, 84 cases,
1894, 72 cases,
1895, 77 cases,
1896, 45 cases.

ST. LOUIS, MO.

JUDGE SPRINGER: I didn't understand, what was this, cases or deaths?

A. Deaths per 100,000. I was simply reading it so as not to confuse it. I will read it year and deaths.

1225 JUDGE SPRINGER: Well, you need not every time, doctor.

A. 1890, St. Louis, Mo., 94 deaths per 100,000,
1891, 30 deaths,
1892, 37 deaths,
1893, 103 deaths,
1894, 31 deaths,
1895, 19 deaths,
1896, 19 deaths,

ATTORNEY-GENERAL CROW: Have you the figures with you for 1900, 1901 and 1902 for St. Louis?

A. Yes, sir.

Q. Please give me those?

A. I also have the figures for 1893, 1894 and 1895, I think.

Q. I just want those for 1900, 1901 and 1902.

JUDGE SPRINGER: What was the last one you gave for St. Louis?

A. 1896, 19 cases.

Do you want from 1896 on?

Q. Yes, you can put them right in there.

1226 A. 1897—but I have not deaths per 100,000, I would have to calculate that out. I have not the deaths per 100,000. I have the total number of deaths.

Q. Well, that don't go in here, because this is per 100,000.

A. Yes, sir, this is per 100,000. I would have to work that out here.

ATTORNEY-GENERAL CROW: Now, I have got a witness that wants to get away.

JUDGE SPRINGER: All right, the doctor may stand aside.

1227 ARTHUR C. LOOLEY,

Called as a witness on behalf of the complainant, being first duly sworn was examined in chief by Mr. Woerner and testified as follows:

Q. Your name is Arthur C. Looley?

A. Yes sir.

Q. What is your business?

A. Grocery clerk.

Q. Where do you reside?

A. 1034 South 8th St.

Q. In St. Louis?

A. Yes sir.

Q. You say you are a grocery clerk?

A. Yes sir.

Q. What was your business before that?

A. Well, I have always followed that.

Q. What were you doing in October, 1901?

A. I was in a grocery and saloon.

Q. Were you ever engaged in the collection of water?

A. Yes sir.

Q. When?

A. The 7th day of October I started collecting.

Q. Of what year?

1228 A. 1901.

Q. Now, how long did you continue?

A. About 10 days.

Q. By whom were you employed?

A. Dr. Teichmann.

Q. The City Chemist of the city of St. Louis?

A. City Chemist, yes sir.

Q. Well what did you do?

A. I went up to the Chain of Rocks every morning and

I took 8 samples out of the river and three out of the outlet screen chamber, two large ones and one small one.

Q. How many did you take at the Chain of Rocks?

A. Out of the river?

Q. Yes.

A. Eight. And three out of the outlet stream chamber.

Q. Wait a minute. How did you take them out? What part of the river did you take them out of?

A. Two from Missouri and two from Illinois; two from the middle and then two from the tower.

Q. Two from the tower?

A. Yes sir.

Q. When you say two you mean two bottles?

A. Two, yes, of the large bottles.

1229 Q. What kind of bottles were they?

A. Gallon bottles.

Q. Describe their appearance—how did you take the water out of the river?

A. Put it in one of them machines over there and put it under the water, then pulled up the lever—

Q. Describe the machine as well as you can.

A. Well, there is one of them all right (indicating).

ATTORNEY-GENERAL CROW: Well, that is Exhibit No. 15.

MR. WOERNER: All right, that is what you refer to.

A. Yes, sir, that large one.

Q. That sample you took is taken from under the surface of the water?

A. Yes sir.

Q. And corked underneath?

A. Yes sir, corked underneath.

Q. Did you take that every day?

A. Yes, every day for about 10 days is all I was up there.

Q. Any other place that you took samples from?

A. No sir.

Q. What did you do with the bottles after you got them out?

A. I would tag them, where I had taken them from.

Q. You would tag them would you?

1230 A. Yes, sir.

Q. What would you put on the tag?

A. Whatever time I had taken it out of the water and the temperature of the air and of the water.

Q. Anything else?

A. No sir.

Q. Did you put your name on it?

A. Yes sir, put my name on it.

Q. Then what would you do with them?

A. Then I brought them up to this laboratory up there.

Q. Where?

A. There at the Chain of Rocks.

Q. And then what would be done with the bottles?

A. They used to cork them up up there and then tie them up with a little cloth, I put around them.

Q. Just go on and say what was done with them as far as you know?

A. That is all I see was done with them and they put a seal on them. Then would pack them in ice; then they brought them down to this chemist's office.

Q. How were they sent down?

1231 A. In a wagon. They were put in a box with ice in it and then sealed up and then put on this wagon and brought down to the chemist's office.

CROSS-EXAMINATION,

By Judge Springer.

Q. What season of the year was this?

A. October 7, 1901, I was up there about 10 days that was all.

Q. What was the stage of the water in the river at that time, if you know, high or low was it?

A. Why it was kind of high.

Q. High?

A. Yes sir.

Q. Did you notice the difference in the appearance of the water—

A. No sir, I never paid any attention to it.

Q. You did not?

A. No, sir.

Q. You went out in a skiff?

A. Yes, sir went out in a skiff.

Q. How far from the Illinois shore did you take the
1232 sample that you have spoken of as having been taken
from the Illinois shore, how far from the shore was it?

A. I just couldn't say how far.

Q. About how many feet?

A. About 100 ft or two.

Q. 100 ft.?

A. Yes, sir.

Q. Was that in the channel of the river, was the water running there, or was it near enough to the shore to be quiet?

A. It was running.

Q. Running water?

A. Yes, sir.

Q. Did you notice any difference between the water on that side of the river and the Missouri side?

A. No, sir I never paid any attention to that.

Q. You never paid any attention to that.

A. No, sir.

MR. WOERNER: Q. How far beneath the surface did you take this water from?

A. About 3 ft.

1233 DR. AMAND NICHOLAS, RAVOLD,

Resumed the stand for further direct-examination by Attorney General Crow, and testified as follows:

Q. I show you a map, Doctor Ravold; what is that?

A. It is a chart prepared by me. It reads as follows:

Chart showing cases and deaths from typhoid fever in St. Louis, Missouri when water supply was taken from the Mississippi River at Bissell's Point, from January, 1890 to September 28, 1894, and from September 28, 1894, to December, 1902, when the water was taken from the river at the Chain of Rocks.

The next below that is written January 17, 1900, Chicago Drainage Canal first put in operation—no, below that is written Water from Bissell's Point, January, 1890 to September

28th, 1894, five years. Cases of typhoid fever 6222; deaths from typhoid fever 1268. Now below that is written; Water from Chain of Rocks, 1895 to 1900, five years.

Typhoid fever cases, 2490; deaths from typhoid fever, 562.

And back of that is written, with an index pointing to the percentage decrease in typhoid fever death rate 125 per cent.

Q. From what time to what time?

1234 A. From these. The difference between the number of deaths when the water was taken from Bissell's Point, January, 1890, to September 28th, 1894, and when the water taken from the Chain of Rocks, beginning at each date, September 28th, 1894, and running to 1900—

MR. WOERNER: The percentage is how much?

A. Now the percentage is 125. It is a decrease of 125 per cent in the number of cases between the two periods when the water was taken from the two pumping stations.

Q. ATTORNEY GENERAL CROW · Now do you know any reason, as a bacteriologist and as a hygienist for that great decrease? If so, what was it?

A. The Intake of the Waterworks at Bissell's Point is located—6,800 feet on the river below Harlem Creek, and the creek drains an area upon which dwell some 10,000 people, and they discharge their sewage into it. Harlem Creek discharges into the Mississipp river and ran for a time into the Intake of the St. Louis water supply?

Q. Did you investigate that at the time?

A. Yes sir.

Q. Did you trace the sewage from Harlem Creek into the Mississippi?

1235 A. I saw the black water from Harlem Creek running into the Intake at Bissell's Point in 1892. In 1893 a dam was built across Harlem Creek, pumps put in and the water pumped from above this dam to below Bissell's Point. A remarkable fall in the number of cases and typhoid deaths followed.

Q. What was the decrease?

A. Well the difference was between 488 deaths in 1892, 215 in 1893, and 178 deaths in 1894. That is for the fiscal year; that is the difference in the typhoid deaths it made to have the sewage pumped and discharged into the sewers below the Intake. Still, in high water the sewage would run over the dam—

Q. The dam in Harlem Creek?

A. The dam in Harlem Creek, yes sir.

Q. What was done to remedy that?

A. The pumps of the water works were moved to Chain of Rocks.

Q. How far above Bissell's Point?

A. Six or eight miles.

Q. By River?

A. By river.

Q. Now what year were they moved there?

A. They were moved on September 28th, 1894.

Q. Now what does that chart show with reference to the
1236 increase or decrease of the typhoid in this city after that
removal, up to 1900?

A. Well, next below that, that 125 per cent is written.

Water at Chain of Rocks since the opening of the Chicago Drainage Canal, January 17th, 1900, three years,—3426 cases and 588 deaths.

Water at Chain of Rocks three years before opening of the Chicago Drainage Canal, for the years, 1897, 1898 and 1899, 1807 cases; 350 deaths.

Back of that is shown, Increase in typhoid death rate since opening of the canal, three years, 68 per cent.

Do you want a further description of this chart?

Q. Yes, you might just describe it and then I will put it in, or explain it rather.

A. On the left hand margin of this chart are written figures beginning with zero and extending to 2,000 whch indicate the number of deaths and cases.

On the lower margin of the chart is written the year, 1890, 1891, 1892, up to 1902. Below that, water from Intake at Bis-
sell's point until September 28th, 1894, and the index
1237 shows this date. Then back of that water from Intake at
Chain of Rocks, St. Louis waterworks.

Now then, columns in solid black and solid red rise on this chart; at the top of them are written, on the black, number of cases—

Q. Of typhoid?

A. Of typhoid. And on the red columns number of deaths by typhoid. The cases are in black; the deaths in red. I should say that these are the official statistics of the Health Department furnished me—I have it here:

"An executive session of the Board of Health was held this date. Present, Mayor Wells, Dr. Starkloff, Dr. Merrill; Dr. Chapman, and Mr. Blong.

Mayor Wells in the Chair.

The attached is a full, true and correct copy from the executive proceedings of the Board of Health, in the matter and of the date above set forth.

Signed by Mark Kauffman, Clerk of the Health Commissioner, and Board of Health."

And from these statistics this chart has been prepared to show graphically the number of cases reported to the Health
Department by the physicians of the City of deaths from
1238 typhoid fever reported by the physicians of the city and
to show the decrease in the death rate following the placing of the pumps at the Chain of Rocks for five years, and the increase following the opening of the Chicago Drainage Canal.

Q. Now what was the date of the epidemic caused as you said, by the Harlem Creek sewage?

A. That was in 1892.

Q. Now give me the death rate for the three years just back of that, including 1892?

A. We have for 1890, 277 cases—or deaths rather. For 1891, 160 deaths—Do you want cases and deaths both?

Q. Yes.

A. Well, you will have to begin again then:
1890, cases 547; deaths 277,
1891, cases 447; deaths 160,
1892—this is the celendar year,—3624 cases, 488 deaths.

Q. That was the year that the Harlem Creek sewage ran into the Intake?

A. Yes, typhoid on the watershed.

Q. Now what was the date that the dam was built across
1239 Harlem Creek?

A. I haven't that. I can give you that later.

Q. Well, what year?

A. The fall of 1892.

Q. Now do you know of your own personal knowledge that there was typhoid on the sewage area whose sewage out-fall went into Harlem Creek in 1892?

A. Do you mean did I treat the case?

Q. No, I don't mean that.

A. No, I know from the Health Department statistics, that cases existed there.

Q. Now will you give me the three years immediately succeeding the removal of the Intake from Bissell's point, six miles above Harlem Creek to this present location, 1500 feet from the shore line of Missouri in the Mississippi River at the Chain of Rocks?

A. I gave you 1890, 1891 and 1892. Now you want 1893, and 1894 do you?

Q. Well, yes, you can put them in, but I wanted the other—Well, just strike out that question.

A. What question?

Q. About 1893 and 1894—put 1893 and 1894 in.

A. All right. 1893, cases 788; deaths 215;
1894, 816 cases; 178 deaths.

1240 Q. Now was the typhoid rate there still affected by the Harlem Creek sewage?

A. After 1894?

Q. Yes?

A. No sir.

Q. Well, but during the years 1893 and 1894?

A. Oh yes, a little bit, because in high water, the pumps were not heavy enough to take all of the water that is discharged on that watershed, so it ran over the dam.

Q. For 1893 and 1894?

A. Yes sir.

Q. Now answer my previous question. Give me the typhoid cases and death rates for the three years preceding January, 1900?

A. Oh, we have 1897, 433 cases; 125 deaths;
For 1898, 426 cases, 95 deaths,
For 1899, there is 948 cases, 130 deaths.

Q. Now do you know the occasion of that increase?

A. In 1899?

Q. Yes, in 1899?

A. I have looked over the Health Statistics. In 1899 we have a remarkable number of cases, in November, 488 cases reported and 31 deaths; and in December 116 cases, 20 deaths, which makes the great increase in this year. It was as-
1241 certained at this time, in fact I saw the men at work.—The river was so low in 1899 that it was feared by the Water Commissioner that the lowest gates in the Intake tower would not be low enough to admit enough water for the pumps, so a coffer dam was built about the Intake and men put at work breaking a hole through the tower for the purpose of putting a gate in.

Q. Where abouts did they work now?

A. They worked at the Intake tower out in the river.

Q. Yes, but what part of it?

A. That would be on the east side of the tower.

Q. How high up?

A. They were down as low as they could go so as to have a very low gate for low water periods.

Q. Beneath the water?

A. Yes sir.

Q. Did they go down to the bottom of the river?

A. They had things stirred up pretty well, yes sir.

Q. They worked at the bed of the river and stirred up the mud?

A. Yes sir.

Q. Now from a bacteriological and sanitary standpoint, what was the effect of that stirring up of the silt and mud in the bottom of the river where it had settled at the bottom of
1242 the Intake tower since it had been put in there?

A. The result would be, of course, to stir up any bacteria,—any typhoid or pathogenic bacteria in the water there.

Q. From a scientific standpoint as a bacteriologist and hygienist then, do you think that would account for the increase in the death rate?

A. Well, if it were due simply to the stirring up of the mud, there would be a suspicion that that was the cause, but I have not sufficient data to enable me to draw the conclusion that that was really the cause ,although the cause for that particular flare in November has been ascribed to the work that was going on in October, in that tower.

Q. Do you know whether or not at that time there was any dredging going on at Kampsville, in the Illinois River?

A. I know there were dredges at work in the Illinois river below Kampsville.

Q. Do you know what they were doing?

A. I think they were digging out a channel for boats.

Q. Digging out the bottom of the bed of the river?

A. Yes sir.

Q. What was done in this dredging process, with the
1243 matter when it was abstracted from its resting place on the bottom of the river, this mud and silt?

A. Carried off to one side.

Q. Out of the stream?

A. Yes,—deposited back into the stream.

Q. Not thrown from the river onto the bank, but back into the water?

A. Yes sir. I saw the dredges at work on it, that is, digging up the bottom with a great apparatus, that they have for that kind of work.

Q. Now take the next three years?

A. 1900, 1901 and 1902?

Q. No sir, 1897, 1898 and 1899?

A. Yes sir.

Q. After the removal of the Intake tower from Bissell's Point to the Chain of Rocks, from your knowledge of the typhoid rate of mortality in the city, would you say that that was a fair average?

A. Of deaths to cases here?

Q. Yes sir?

A. Oh no.

Q. Well, will you please give me the next that would indicate a fair average, prior to the opening of the canal?

1244 A. Prior to the opening of the canal. When we go back over the statistics, that is of the typhoid fever cases and deaths take the case at Plymouth, for instance; there were 1104 cases and 114 deaths, 10.3 per cent,—in other words 10 out of every 100 died.

ATTORNEY GENERAL HAMLIN: I object to that. That is an argument.

A. (continuing) And my personal experience in this city in hospitals would make the per cent anywhere from 7 to 15, depending upon the stage of the disease in which the typhoid cases reached the hospital. While my experience for twenty years as a practicing physician in this city in the treatment of typhod fever, the relation of deaths to cases would not be 1 to 15. That is, practicing in the homes of the individuals sick. The reason for this is that we see the cases early and can do more for them at home. While in the hospitals the patient reaches there after he is seriously sick, and the chances for treatment and recovery are not so good, so these figures on the chart showing the relation of cases to deaths are not comparable at all.

Take any one of these years, any one you may please. We find that for 1892, for instance, we have 488 deaths and 3624 cases recorded. There ought to be at least 5,000 cases recorded by physicians,—or take the lowest there, 1898, 95 cases, which
would mean 950 cases in the town—if there were 95
1245 deaths, if there were only one death in ten cases.

Q. You only get from the health statistics then the reported cases?

A. That is all. A physician does not report every case; he reports every death.

Q. Then the death rate is more nearly the index than the cases reported?

A. Yes sir.

Q. Now will you give me the number of cases with the death rate for the years 1900, 1901 and 1902?

A. Yes sir. In 1900 there were 1213 cases reported by the physicians of the city to the Health Department, and 168 deaths.

In 1901 there were 1101 cases reported, with 198 deaths.

In 1902 there were 1112 cases reported, with 222 deaths.

ATTORNEY GENERAL CROW: Now I want to offer that map as an exhibit.

Said map received in evidence and marked by the Commissioner "Complainant's Exhibit No. 22. Frank S. Bright, Commissioner."

ADJOURNED until 2:00 P. M., same day, Monday, March 9, 1903.

Southern Hotel, St. Louis, Missouri.
1246 2:00 P. M., Monday, March 9th, 1901.
Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD,

Resumed the stand for further direct-examination by Attorney General Crow, and testified as follows:

Q. Now doctor, I want to turn to another portion of this investigation; that part of it about what is termed excrementatious matter that comes from the City of Chicago—together with the population of that city, and the drainage area, etc.

Now do you know—Have you ever investigated and ascertained what the census of 1900 gives Chicago?

A. The population of the City of Chicago is estimated, or rather the census of the United States for 1900 gives it 1,650,000 people.

Do you know what portion of the population of the State of Illinois discharges sewage—throws sewage out into the canal above Lockport?

A. The proportion of population of the State of Illinois, in the vicinity of Chicago, which also discharges its sew-
1247 age into the Chicago Drainage Canal above Lockport, at which point the controlling works of the Chicago Drainage Canal is situated, is roughly estimated at 350,000 people.

Q. This is outside of the city limits?

A. Yes sir.

Q. Of the City of Chicago or the Sanitary District

A. Yes sir.

Q. Did you make a table of about how much—

A. 2,000,000 people, whose waste products are emptied into the Drainage Canal above Lockport—

Q. That Drainage Canal is approximately how far from Chicago?

A. But the Drainage Canal runs there—

Q. No, I mean the emptying of it at Lockport—

A. Well, the waste products of these 2,000,000 people are emptied into the Drainage Canal above Lockport, twenty-seven miles approximately, from the City of Chicago proper.

Q. Are you acquainted, from a scientific standpoint with the amount of solid and liquid matter of which the ordinary sewage is composed, according to the population of cities?

A. Well, I have made some measurements myself. They vary in myself, for instance from three to six ounces of excrementatious matter per day. The physiologists also give figures on that. Quite a number of them are authorities on that
1248 subject.

Q. Have you got those figures. Do you know what they are?

A. Well, there are about three ounces of solid excrementatious matter and 40 ounces of urine.

Q. That is per capita per day?

A. That is per capita per day.

Q. Well now, is that from the statistics and experience of people who have made experiments; is that a fair average?

A. Yes sir, that is a low average.

Q. How have you ever figured on a population of 2,000,000 people draining into that canal, to see how much solid matter and how much liquid sewage would pass in in the course of a day?

A. Yes sir, if each of those 2,000,000 people discharged three ounces a day, the total results would be about 187 to 190 tons.

Q. Of solid matter?

A. Yes sir.

Q. That is of human offal?

A. Yes sir.

Q. Now have you figured on the amount of liquid material?

A. Forty ounces a day would give 670,000 gallons of urine.

Q. Of urine?

A. Yes sir.

1249 Q. Per 24 hours?

A. Yes sir.

Q. Now have there ever been any figures made by sanitarians and water experts, with reference to the amount of sewage as proportioned to the water consumption?

A. Yes, it is commonly assumed that the sewage is within reasonable limits, proportional to the water consumption of the city, and within the city limits it is very nearly so, but deductions must be made for evaporation and other causes.

Q. When you say sewage sewage do you mean the liquid sewage?

A. I mean the liquid matter flowing in a sewer.

Q. That does not include the solid organic substance?

A. Yes it does; it is the solid organic substances of man, the urine and feces.

Q. And it includes the volume that flows through the pipes of the sewers?

A. Yes sir.

Q. Of the tunnels?

A. Yes sir.

MR. RANDOLPH (Chief Engineer Sanitary District of Chicago): That is based on 43 ounces per head?

A. Yes sir, three ounces of feces.

MR. RANDOLPH: That is a total of 43 ounces?

1250 A. Yes sir.

Q. ATTORNEY GENERAL CROW: Have you any idea of the water consumption of the City of Chicago per day in gallons?

A. I believe it is 150 gallons per inhabitant a day. That would be 300,000,000 gallons per day, something like 360,000,000 gallons a day for the whole population.

Q. Then would their water consumption reach 360,000,000 gallons there?

A. Yes sir.

Q. For the 2,000,000 people?

A. Yes sir.

Q. Then what would be the proportion of water that went into the sewers and thence into the canal, if all the water from the sewers went into the canal, and all the sewage that entered, what proportion of water to the total amount of liquid and solid sewage?

A. Well I have made an estimation of that kind, based upon the fact—or, it is not a fact, but we believe that Chicago was discharging—or the Drainage Canal was discharging 300,000 cubic feet of water per minute—but it is not doing that—but based upon those figures, we find that the sewage of Chicago would be diluted by the amount of water which is flowing into the
1251 canal, assuming that 300,000 cubict feet are discharged per minute—as 1 to 9.

ATTORNEY GENERAL HAMLIN: One of sewage to nine of water?

A. Yes sir.

Q. ATTORNEY GENERAL CROW: Now what is the effect of this sewage, or the water in the canal as it approaches Lockport with reference to whether or not it approaches more nearly water, or what you call crude sewage?

A. Well, this sewage of this portion of Illinois is diluted to the extent of one to nine, approximately, with Lake Michigan water. It is readily seen by a persual of the bacteriological results which have been submitted here, obtained from an analysis of samples collected daily at Locqport, that the diluted sewage at this point does not approach in the slightest degree to the resemblance of a sanitary water.

ATTORNEY GENERAL HAMLIN: Of what point are you speaking?

A. At Lockport.

Q. JUDGE SPRINGER: Sanitary water?

A. Yes sir.

ATTORNEY GENERAL CROW: Now what was the effect of that sewage on fish at Lockport?

A. Well, at times depending upon the quantity of sewage discharging into the stream, I have seen the water dis-
1252 charging over the Bear Trap Dam—quite a number of times, I have seen dead fish floating in the water in quite large numbers once or twice; but we sent a man up there to study that subject and in November of 1900 five hundred fish were observed passing over the Bear Trap Dam in the space of ten minutes.

ATTORNEY GENERAL HAMLIN: Wait a minute. Is that your observation?

A. That was from the observation of Mr. Miller, who was sent there to look after that question—500 fish in ten minutes.

Q. ATTORNEY GENERAL CROW: Well, have you seen the fish yourself, pass over there?

A. Yes, I have seen the fish myself pass over the Bear Trap Dam.

Q. Now, just below Lockport does the canal join any other stream?

A. Yes, the canal joins the Des Plaines River.

Q. Now between Lockport and Joliet, the distance is how great?

A. Sixty or seventy miles.

Q. What is the fall—do you know?

A. 22 feet.

Q. That approaches something like three feet to the mile?

1253 A. Yes sir.

MR. RANDOLPH (Chief Engineer of the Sanitary District of Chicago): You are off on that. It is 4 and one-half.

ATTORNEY GENERAL CROW: How about the fall?

MR. RANDOLPH: The fall is about 37 feet.

THE WITNESS: If you will permit me, I will take the figures of Mr. Randolph, four and one-half miles, and the fall is 37 feet, say, make it five miles and 37 feet and it is easy to get at the details.

ATTORNEY GENERAL CROW: Well, you had better make the statement that these are his figures and not your figures.

A. Yes sir.

Q. Say that they are the figures of Mr. Randolph. I presume they are correct?

A. Yes, he knows much more about it than I do.

JUDGE SPRINGER: If you have no objection, you may state that Mr. Isham Ranholph is the Chief Engineer of the Sanitary District of Chicago, and he may appear in the record as having made this statement. That will make it more clear.

Q. ATTORNEY GENERAL CROW: That is very near a cascade, isn't it, a fall of 37 degrees?

A. Yes sir.

Q. Now do you know what the census of 1900 gave the
1254 City of Peoria in population?

A. 1900 census gave the poulation of Peoria as 56,100.

Q. Do you know what the minimum flow of the Illinois River at Peoria was before the Drainage Canal was opened?

A. Taking Mr. Harmon's figures, from his report to the Illinois State Board of Health, and we have 1221 cubic feet—we figured it 1200 cubic feet per second.

Q. Now assuming that the people in Peoria had an out-fall of sewage equivalent to the same number of people in the City of Chicago, how many gallons per day per capita at Peoria would go into the water of the Illinois River?

ATTORNEY GENERAL HAMLIN: That is objected to on the ground that there is no allegation in the bill, charging the discharge of sewage at Peoria, or any claim made growing out of any such discharge.

THE WITNESS: Ask the question again?

Q. (Question repeated).

A. Assuming the same we would have 150 gallons per capita.

Q. Now, if the flow of the Canal is 300,000 cubic feet per minute; if that was true what would be the proportion of dilution of Peoria sewage in the water of the Illinois River?

A. Well, basing it on a flow of 1200 cubic feet per second,
1255 and taking 56,100 people with a discharge of 150 gallons
per head per day, that would give a dilution of 1 to 92 at this low river stage. That is, the Peoria sewage.

ATTORNEY GENERAL HAMLIN: I don't think I quite understand your answer.

A. You see the sewage of each person there would be diluted nine thousand times with this low river flow of 92 feet,—the quantities of the water of the Drainage Canal—

Q. What is the distance from Peoria to Grafton?

A. 160 miles.

Q. Is that by river or by the winding of the wagon road, or rail?

A. I think that is by river. I never measured it. This is taken from the report. Do you want the dilution of the Drainage Canal in here with the Peoria sewage?

Q. Yes, what would that be? If you let the water of the Drainage Canal in, what would be the dilution, along with the Illinois River water?

A. Well, with that 300,000 cubic feet per minute added by the Drainage Canal, if that were added to the low river stage of the River, the Illinois River at Peoria, the dilution would be 1 to 413.

Q. Now would that amount of sewage render the Illinois
1256 River water at Grafton unpotable the amount that comes
in from Peoria?

A. Well now the question is, what do you want it with: with that low river?

Q. No, just scratch that question out. I will put it in shape where he will understand it.

If the Chicago canal water were free from sewage contamination and was emptying this lake Michigan water in the pure state into the Illinois River at Peoria, at low stage of the Illinois River, would the pollution from Peoria, if the pollution in the sewage is in the proportion that you have stated heretofore,—render unpotable the water of the Illinois river, at its confluence with the Mississippi at Grafton 160 miles below, from a bacteriological standpoint?

A. By potable,—Unpotable, I suppose you mean—

Q. I mean fit for domestic purposes, drinking, and cooking?

A. Well it would reduce the danger to a minimum, that is just dilution alone?

Q. Yes.

A. At Grafton.

JUDGE SPRINGER: I want to enter an objection to that question and answer from the fact that it does not illustrate any issue in this case, and from the further fact that there
is a great deal more pollution from Peoria comes into
1257 the stream from Peoria, and the Illinois River.

THE WITNESS: You mean from around Peoria?

JUDGE SPRINGER: I mean more than comes in from Peoria. There is Sangamon, Pekin—

ATTORNEY GENERAL CROW: This is a hypothetical question purely, I assumed that your lake water was all right, too.

JUDGE SPRINGER: Well the hypothesis is not based upon any possible condition that can exist; that is the reason I object to it.

ATTORNEY GENERAL CROW: Now doctor, in case of towns not sewered, rural districts in proximity to rivers or the feeders thereof, brooks and streams, what proportion of the population in making a sanitary estimate, is usually figured as sending its sewer outfall into the street?

A. Well it has generally been said by sanitarians as equal to one-sixth of the sewage of those people that eventually gets into the river.

Q. Now have you got a table showing the population of the drainage basin of the Illinois River, with the flow per cubic feet—all its territories, with the urban and rural population on the census of 1890?

A. I have a report of Mr. L. E. Cooley. Yes, I have the numbers taken from Mr. Cooley's work on Waterways.

1258 Q. At the time he made that report, do you know what official position he occupied with reference to the drainage canal?

A. No, I do not know, but was he not the Chief Engineer of the Drainage canal then?

Q. Anyhow, you have got the table of figures?

A. We can get the exact date of this table.

Q. Yes. You can do that later.

A. Yes, I have got a report of Mr. L. E. Cooley, giving the total population of the drainage basin of the Illinois River, with flow, cubic feet per second; urban population, census of 1890; rural population, census of 1890, with totals.

Now we have, Rivers, the Des Plaines River. Cubic feet of flow per second, 13.21.

Urban population census, 1890, 20,354.
Rural population, 45,247,
Total population, 75,601.

The DuPage river:

Flow per cubic feet per second, 32.77,
Urban population, census, 1890, 5,344,
Rural population, 10,890,
Total, 16,234.

Kankakee River:
509.24 cubic feet per second.
Urban population, 26,697,
1259 Rural population, 140,441,
Total, 170,138.

Fox River:
329.95 cubic feet per second,
Urban population, census 1890, 72,763,
Rural population, 89,889,
Total, 162,652.

The Vermillion River:
This is Mr. Harmon's report, he personally informed me that this is correct.
4 cubic feet per second,
Urban population, 17,543,
Rural population, 43,257,
Total, 60,800.

Mackinaw River:
Flow, cubic feet per second, not given,
Urban population, 5,247,
Rural population, 30,106,
Total, 35,353.

Spoon River:
87.76 feet—cubic feet per second,
Urban population, 19,619,
Rural population, 56,428,
Total, 76,047.

1260 Sangamon River:
Flow per cubic feet per second, 372.30,
Urban population, 103,720,
Rural population, 177,638,
Total, 281,358.

Crooked Creek:
Flow not given,
Urban population, 12,739,
Rural population, 44,289,
Total, 57,028.

Macoupin Creek:
Flow not given,

Urban population, 9155,
Rural population, 32,296,
Total, 41,453.

McKee's Creek:

Flow is not given,
Urban population not given,
Rural population, 8,823,
Total, 8,823.

1261 The Illinois River direct:

Flow not given.
Urban population, 135,139,
Rural population, 184,877,
Total, 320,016.

Sanitary District of Chicago:

Urban population, 1,800,000,
Rural population not given,
Total, 1,800,000.
No flow for the Sanitary District of Chicago for 1890.

Totals:

Urban population, 2,241,320,
Rural population, 864,183,
Total, 3,105,503.

Q. Now do you know what the city of Alton, what their population is?

A. The city of Alton, population is 15,000.

Q. Do you know where the out-fall of the sewage of the city of Alton is?

A. Yes sir.

Q. Where is it?

A. It discharges its sewage into the Mississippi river.
1262 They have five main outlets, three of which empty into the Mississippi river, behind dikes which quite effectually check that portion of the sewage from becoming mixed at once with the waters of the main channel of the river.

Q. Do you know where Hartford is?

A. Yes sir.

Q. Where is it, on the Missouri shore?

A. It is on the Illinois shore.

Q. How far from Alton?

A. Five or six miles below Alton.

Q. Below Alton?

A. Yes sir, about one mile above the point where the Missouri river enters into the Mississippi river.

Q. Have you got the average number of bacteria found in the waters of this river at these two points, Alton and Hartford?

A. Yes sir.

Q. What were they?

A. Monthly average results of quantitative analyses of Mississippi river water one mile above Alton and opposite Hartford respectively, together with the average results of the tests for the bacillus coli communis—month and year, 1900—

ATTORNEY-GENERAL HAMLIN: Now this is at one place?

1263 A. No this is at two places.

JUDGE SPRINGER: The average of the two?

A. Yes, we are giving the averages; average one mile above Alton and average at Hartford, five or six miles below Alton.

January, 1900, bacteria, Alton, 118,800.

ATTORNEY-GENERAL CROW: That is the coli bacillus?

A. The bacillus coli communis. 14 per cent of the time.

Bacteria at Hartford, same date, month of January, 90,600,
Coli communis 17 per cent.
February, bacteria at Alton, 192,500,
Bacillus coli communis, 17 per cent.
Hartford, 190,600,
Bacillus coli communis 50 per cent.
March: Alton, 192,300,
Coli communis 51 per cent.
Hartford, 208,300,
Coli communis 52 per cent of the time.
April, 29,400, for Alton.
Coli, 39 per cent of the times.
Hartford, 29,700,
Coli 41 per cent.
May: Alton, 10,300,
Coli 54 per cent.

1264 Hartford, 12,800,
Coli 86 per cent.
June, Alton 8,200,
Coli 60 per cent,
Hartford, 5,800,
Coli 61 per cent.
July, Alton, 7,700,
Coli 52 per cent,
Hartford, 61,000,
Coli 55 per cent.
August, Alton 2,400,
Coli 88 per cent.
Hartford, 2,100,
Coli 89 per cent.
September, Alton 2,600,
Coli 90 per cent,
Hartford, 2,800,
Coli 93 per cent.
October, Alton, 2,100,
Coli 100 per cent.
Hartford, 2,400,
Coli 100 per cent.
Period of 1901. Do you want that?

Q. Have you got the figures for October and November, 1900, the average at these two points for the months of October and November only? 1265

A. Yes sir. Now 1901, October, Alton 1,137,
Coli 100 per cent,
Hartford, 2,141.
Coli 86.4 per cent.
November, Alton, 1,566,
Coli 77 per cent.
Hartford, 3,000,
Bacteria 56 per cent.
Do you want to know the dilution there?

Q. Have you got it? Yes, you may give it.

A. Now the sewage hangs behind these dikes and is only flushed out at times when the river is flooded. Assuming, however, that the whole of the sewage of Alton becomes mixed with the Mississippi river water, and is carried directly towards Hartford, with a minimum flow of 25,000 cubic feet per second, in the Mississippi, it will be seen that the sewage of this city of 15,000 people is diluted in a minimum of over one to 70,000. That is supported by bacteriological results, so the extent to which the Alton sewage is disposed of by dilution, the bacteriological results of Alton and Hartford respectively show no material difference.

Do you want the conclusion on that, Mr. Crow?

1266 Q. Now, doctor, that statement, that it is diluted 1 to 70,000, is upon the assumption that the sewage when it leaves the outfall of the sewers at Alton would become diluted with the whole body of the water of the Mississippi river at that point?

A. Yes sir.

Q. In other words, that there would be a general mixing of all of the waters of the Mississippi river running via the sewage outlets from the outfall of the sewers?

A. Yes sir.

Q. What was it you asked me?

A. I want to know if you want the conclusions of the biological and bacteriological results?

Q. Yes, give that?

A. From these figures it will be concluded from the biological results, that the sewage of the city of Alton has no effect on the sanitary condition of the Mississippi river water at Hartford.

Q. That is six miles below?

A. Yes sir.

Q. Please explain the bacillus prodigiosus; what is the bacillus prodigiosus?

A. The bacillus prodigiosus is a micro-organism, a bacterium that was discovered by Ehrenberg. It is a bacillus a little bit larger than the typhoid bacillus. It is non-spore forming; it is non-pathogenic. It is founded on the word 1267 "prodigious" as I understand it, and comes from the fact that the host sometimes in the chalice in the Catholic Church, has a red growth upon it, which is declared to be the blood of Christ. This red growth was investigated, and it was found in one case to be a micro-organism producing a red material within its cell, a red pigment. You see, the name, this prodigious thing that is the legend connected with this micro-organism.

Q. Yes, put it in there; that is all right; put it in the record.

A. Now it grows freely on all of our media, but it does not grow, as we shall see, very well in river water. It has been very rarely found in the river waters of this country. It is not domestic to the waters of the United States, although I was told that in Egypt it is found abundantly in some of the river waters there, and occasionally in some of the river waters in Europe. It grows freely, as I say, on all of our culture media. It liquefies gelatine; it is non-motile, and produces a red pigment which makes it very easy of identification.

Now in our search of the river waters beginning in August, 1899, and extending through until August, 1900, in every sample of water that we examined, where we were hunting for distinctive forms as well as examining every plate that came
1268 in, this micro-organism was never found. We naturally concluded that it was not a normal inhabitant of the streams under investigation, any of them, and that if at all present, very rarely so.

We have examined over 10,000 samples of water from Lake Michigan, the Drainage Canal, Illinois river and the Mississippi river, and have never found it in any one sample except when we put it in the river ourselves—

Q. Yourself?

A. Ourselves; with these facts in our minds in August—August 31, 1900, we prepared in a forty-gallon whiskey barrel, forty gallons of broth culture of this bacillus prodigiosus, and we grew it for several days in that barrel.

Now that barrel was first sterilized with steam heat; then it was filled with boiling hot water, and that water allowed to stand until it cooled, but while the water was boiling hot, there was mixed into it one pound of Liebig's extract which had been boiled thoroughly before mixing with this solution, so it remained in this boiling hot water until that barrel cooled, which took two or three days—

Q. Now explain in that connection what Liebig's extract is, what was the purpose of putting it into the barrel?

A. The Liebig extract of beef is an extract of beef that 1269 is sold commercially here in the market by the Liebig company. It is an extract of beef made by evaporating beef juice. Now this material as we see it in the market, in porcelain jars in which it is sold, contains quite a number of bacteria, but in order to kill all the bacteria in the extract, we first boiled it thoroughly, besides that we put boiling water in the barrel. Nothing will grow in boiling water, so that if there had been any bacteria remaining alive in that beef extract after we boiled it, it would be killed by the continued heat in that barrel, and it took two or three days to cool sufficiently to allow us to put the prodigiosus in it. The bung was closed with a cotton stopper.

Now we put into that barrel a great number of bacillus prodigiosus, in a broth culture. This particular culture of bacillus prodigiosus came from Europe. It was given to me by Dr. Ludwig Bremer several years ago in this city, and I had kept it in my laboratory growing ever since then.

Q. Now wait a minute.

A. The water, the broth in this barrel was studied, and we found that we had over one thousand million bacteria to the cubic centimeter in the broth in this barrel.

On August 31st, 1900, this broth, containing over one 1270 thousand million bacteria per cubic centimeter, was emptied into the Mississippi river just below the mouth of the Illinois river. That is where the Illinois river discharges into the Mississippi. We carried it up there in the harbor boat, and it was emptied from the harbor boat into the river. On the way down on the boat samples were taken right straight along, of the Mississippi river water, the samples were collected hourly and studied.

September 3rd, four days later, this organism was found in a sample collected in the channel of the river at Alton, but at no other place.

On September 20th, this experiment was repeated, a barrel containing 40 gallons of bacillus prodigiosus broth was emptied at the same point, and on September 23rd this organism was found in a sample collected near the Illinois shore at the Chain of Rocks.

Q. Now, doctor—

A. Shall I go on?

Q. Did you continue this experiment on a larger scale?

A. I am not through with this particular experiment—

Q. Go ahead.

A. On October 18th, this bacterium was found in a sample
1271 collected from the laboratory tap, in the old City Hall,
and on October 24th, found in a sample collected near the Illinois shore, Chain of Rocks.

Q. Now, doctor, you continued this experiment later on, a year or so later on, on a larger scale?

A. Yes sir.

Q. Further up?

A. Yes sir.

Q. On the Drainage Canal?

A. Yes sir.

Q. Now will you please relate what you did there, with reference to putting this bacteria into the water?

A. At Lemont?

Q. Yes, and what was the result of it? How far is Lemont now from the city of Chicago?

A. Well, Lemont is eight miles from the Controlling Works on the Drainage Canal, towards Chicago.

That would make it about twenty miles from Chicago, 21 or 22 miles.

Q. And that is the point in the canal, eight miles above?

A. Eight miles above the Controlling Works.

This was during the third period; 107 barrels of prodigiosus broth each containing 40 gallons were prepared at the old pumping station at the St. Louis water works, Bissell's Point, by Mr. E. J. Ravold, my brother, and shipped to Lemont, Illinois, of the active vigilance of the canal police, successfully emptied miles east of the Bear Trap Dam at Lockport, and in spite of the active viligance of the canal police, successfully emptied in the Chicago Drainage Canal on the evening of November 6th, by Mr. Ravold.

Q. How much bacteria was there in a cubic centimeter of these 107 barrels?

A. There were over one thousand million per cubic centimeter. I examined every one of them myself.

ATTORNEY GENERAL HAMLIN: November 6th, what year?

A. 1901.

Q. ATTORNEY GENERAL CROW: Now what effort was made and at what points, to see if these bacteria came down the river? Well, you go ahead and tell the experiment in your own way.

A. I must say that in the first place I needed a courageous man to do this thing, a very powerful man, and I didn't know where to look for him, except in a brother of mine whom I brought up from Arizona; he knows a thing or two about taking care of himself, and is physically a powerful man, and he handled these barrels, containing 40 gallons of broth, himself. He emptied nearly all of them himself into the canal, as I related to you, on the afternoon and night of that November day.

Now all of the laboratories were notified, and samples were
1273 collected every hour of the day and night at the Controlling Works, Drainage Canal, and at Joliet, Peoria, Grafton, on the Illinois river, and the intake of the water works, Chain of Rocks.

Q. Intake St. Louis water works?

A. Yes sir. We put—our men lived in a room at the Chain of Rocks, and they went down and took the samples—

Q. Went down inside the intake?

A. Sometimes inside of the intake, but that is dangerous business. There is a ladder on the outside of the intake and men went up and down the ladder and took the sample from the river.

Now Mr. Ravold left Lemont rather hurriedly, and went to Joliet, and then to St. Louis, bringing with him six samples from barrels, as they were discharging into the canal. These samples I examined myself, and they contained over 500,000,000 to 1,000,000,000 prodigiosus to each cubic centimeter of broth. The bacillus was not found by Mr. W. C. G. Kirschner, who was stationed at Joliet—

ATTORNEY GENERAL HAMLIN: Now wait a minute, doctor, you are stating now not what you know yourself, but from what they have reported to you?

A. They reported to me. In fact, I went up there.

1274 Q. Then you know this personally?

A. Well, I didn't know; I didn't examine these samples myself. We will get to my own work in this experiment if you wish.

ATTORNEY GENERAL HAMLIN: I want the record to show—

A. I didn't examine the samples collected at Joliet, nor at Peoria, but at Grafton, for a time, and those collected at the intake, and also from the tap of the St. Louis laboratory.

Q. State where you did examine them?

A. I examined personally all the samples collected from December 1st, to December 15th, at Grafton. I examined all the samples that were collected at the intake tower, Chain of Rocks, and every one of the samples from the tap of the laboratory, and that examination continued several months—

Bacillus prodigiosus was found in the St. Louis laboratory in samples collected by Collector Werner, Intake Tower, Chain of Rocks, December 4th, sample was collected at 8:45 a. m.

Another sample taken by Collector Werner at 9:00 a. m. on December 5th contained the prodigiosus.

Q. Now these samples were all taken at the intake?

A. Intake tower, yes sir. Collector Stevenson, Intake Tower, Chain of Rocks, found the prodigiosus at midnight.

The prodigiosus was found by Collector Homer, Grafton,
1275 Illinois, Illinois river, December 6th, at 8 a. m. Found
again in a sample collected by Collector Homer, Grafton,
Illinois, Illinois river, December 7th, midnight.

Q. Now, doctor, go to the characteristics of this bacillus prodigiosus. In the first place give us the longevity of this bacterium in water from the Chicago river and the Drainage Canal and the Illinois river at Pekin and the laboratory tap at St. Louis?

A. A series of experiments were made with the bacillus prodigiosus, Ehrenberg, to ascertain its longevity in samples of water collected from Chicago river, Drainage Canal, Illinois river at Pekin, and laboratory tap, St. Louis. A summary of the results is as follows:

ATTORNEY GENERAL HAMLIN: That is objected to.

A. This is personal work.

ATTORNEY GENERAL CROW: You did this work yourself?

A. Yes sir.

ATTORNEY GENERAL HAMLIN: Go ahead.

ATTORNEY GENERAL CROW: Do you want to put in your objection, General?

ATTORENY GENERAL HAMLIN: No.

A. (Continuing): In laboratory tap water, in sterilized water, 8:00 a. m. to 5:30 p. m., exposed to the direct rays of the
sun—I must say about this sample, a bottle suspended on
1276 a string, about eight feet from the south wall of the house,
so that the sun came upon it early in the morning and left
it at sundown. It was in the sunlight all day. That bacillus lived in this water 48 hours, in sterilized water. Now in the Drainage Canal water, taken above Lockport, not sterilized, in window exposed to sunlight from 11:00 a. m. to 2:00 p. m., it lived ten days.

Drainage Canal at Joliet, not sterilized water, in window exposed to sunlight, 11:00 a. m. to 2:00 p. m., seven days.

In Chicago river, Adams street, sterilized in window exposed to sun, 11:00 a. m. to 2:00 p. m., it lived 11 days.

In Drainage Canal, Lockport water, in non-sterilized water, in refrigerator, temperature 16 degrees centigrade, it lived 32 days. That is, in the dark.

In Drainage Canal water from Joliet, not sterilized, in refrigerator, temperature 16 degrees centigrade, it lived 41 days, and was still alive when the experiment was stopped.

Drainage Canal Western Aveneue, not sterilized—

Q. Western Avenue, Chicago?

A. Western Avenue, Chicago, not sterilized, in refrigerator, temperature 16 degrees centigrade, lived 31 days.

In Illinois river, Pekin bridge, non-sterilized, in refrigera-
1277 tor; temperature 16 degrees centigrade, it lived 53 days,
and was still alive when these experiments ceased.

Q. Now did you make any experiment exposing it to the sunlight in samples of water not sterilized?

A. Yes, I have read that. I said exposed to sunlight in samples of various waters, not sterilized, it lived from two to ten days. In sterilized water, Chicago river, exposed to the sunlight, in window, it lived 11 days.

In refrigerator in the dark, at a temperature of 16 degrees centigrade, it lived 31 to 53 days, and was still alive at the time the work ceased.

Q. Now what does your experiment show about the typhoid bacillus right, in this connection, about its longevity?

A. The results show or demonstrate that in sterilized water, distilled, as well as that from Lake Michigan, Drainage Canal, Illinois river, Peoria and Grafton, Mssissippi river water, intake and laboratory tap, the bacillus lived 61 days.

Q. What bacillus?

A. Typhosus. While in the living water, not sterilized, from Chicago river, Drainage Canal, Illinois river at Peoria and Pekin, Misssissippi river water from the laboratory tap, in the
sunlight, hot summer days, and in the darkness, at 16 de-
1278 degrees centigrade, from 24 hours to 21 days.

Q. What bacillus are you talking about?

A. Bacillus typhosus. This bacillus which lived only 24 hours was exposed similar to the bacillus prodigiosus which I have described heretofore. The bottle was suspended by a string from a rod that projected eight feet from a south wall and the sun came upon it early in the morning, shone upon it all day, of a hot summer day, and left it when the sun went down.

Q. Now from your experiments, it is notable that the typhoid bacillus disappeared somewhat quickly from living waters, more quickly than from steriled waters?

A. Yes sir.

Q. Now in that connection I will ask you to state what you call plankton?

A. Plankton is the floating life in the water, floating vegetable and animal life, microscopic in size.

Q. Now in your opinion as a bacteriologist, does that plankton in the waters of the Mississippi, the Illinois, the Drainage Canal, the Desplaines river, shorten the longevity or would it shorten the logevity of the typhoid bacillus?

A. Not unless it would eat it.

Q. Would it do that?

A. I don't know.

1279 Q. That is an unknown quantity yet, isn't it?

A. That is an unknown quantity.

Q. That is what I wanted to know.

Now have you made a comparative estimation of the longevity of the typhoid bacillus with this bacillus prodigiosus, that you had put into the waters of the Chicago Drainage Canal?

A. Yes sir, I carried on a series of experiments myself.

Q. Well, just give us the result of your experiments, will you?

A. With these micro-organisms side by side, comparative estimation of the longevity of the bacillus typhosus, and the bacillus prodigiosus, in separate samples of water collected at the same time and place, and kept under the same conditions as to sunlight, temperature and darkness, the bacillus prodigiosus in sunlight, in living waters, that is, nonsterilized waters, lived from two to ten days. The bacillus typhosus in sunlight, and in living waters, non-sterilized, lived from 24 hours to ten days.

The bacillus prodigiosus in the dark lived, in the non-steriled, living waters, from 31 to 53 days, and was still alive when the experiments ceased.

The bacillus typhosus, in the dark in living waters, non-sterilized, lived from 24 hours as I stated, to 21 days.

1280 Q. Now is there any resemblance between the bacillus prodigiosus and the bacillus typhosus?

A. Yes, they are both bacilli; they are both non-spore forming, and from the above table it is seen that the bacillus prodigiosus is an organism which closely resembles the bacillus typhosus in its power to resist unfavorable surroundings.

Q. Any difference in their cultural characteristics?

A. Oh yes, widely different, the bacillus prodigiosus being the most easily identified of all bacteria, while the bacillus typhosus is one of the most difficult to identify.

Q. Now, doctor, having carried out these experiments, having treated typhoid fever for twenty years, having been a professor of hygiene in the Washington University, as a practical bacteriologist I will ask you in your judgment, if typhoid bacillus coming from the out-falls of the Chicago sewers into the Chicago river and carried into the Canal, could come into the Intake tower of the St. Louis waterworks, still retaining its vitality?

A. That will depend upon the time that it takes the waters to come from Chicago to St. Louis.

Q. Well, considering your knowledge of the flow?

A. But basing my conclusions upon the experiments that I have carried out, and showing that the Mississippi and
1281 Illinois river water comes into the Intake of the St. Louis waterworks, I am inclined to believe it is highly probable that a typhoid bacillus can live and be carried by water carriage from the Chicago sewers into the Intake of the St. Louis waterworks, especially in high water conditions in the Illinois river.

ATTORNEY-GENERAL HAMLIN: I will enter a motion to exclude that answer as not responsive to the question.

Q. ATTORNEY-GENERAL CROW: Now doctor, does the speed of water affect the life of the bacillus typhosus or the typhoid bacillus? In other words does the rapidity of the current tend to destroy the typhoid bacteria?

A. No sir.

Q. Well, does the volume of water into which a typhoid bacillus may be put affect in any manner its vitality?

A. No sir, it does not kill it.

ATTORNEY-GENERAL HAMLIN: I move that that question and answer be excluded, as not responsive.

Q. Now doctor, you are acquainted, as a bacteriologist, and also as a physician, with the relative number of typhoid bacteria that will be passed with the feces, and with the urine of a patient sick of typhoid fever in the different stages of the fever?

A. Yes sir, I have made—

1282 Q. Can you give me this?

A. (Continuing.) Some experiments on this my very brother who put the prodigiosus in the Canal; he was sick in 1899 and 1900—

Q. With typhoid?

A. With typhoid.

Q. Now will you please give us this experiment?

A. I examined his urine and also his feces once or twice—

Q. To ascertain the number of bacteria?

A. To ascertain whether they were there or not, and in the urine to ascertain the number.

Q. Yes?

A. In the second week of his disease, this typhoid bacillus was found in great numbers in his feces, in the discharges from his intestines.

In the third week they grew less, and in the fourth week they were difficult to find in his feces, but about the end of the second week they began to appear in his urine, so much so, as to be a source of annoyance to him, as to give him trouble, and he began to complain of pain in his bladder, and in the passing of urine. The number of typhoid bacteria in the urine was small, but after a time they reached enormous numbers. I made some calculations, and there were several hundred thou-
1283 sand to the cubic centimeter. I thought that was a pretty large number, but it simply pales before the number found by Petrosky and Mark Richardson. Mark Richardson found bacillus typhosus in the urine of a typhoid fever patient after the second week, 172,000,000 bacilli to the cubic centimeter, of urine. Such urine is very turbid. My brother's urine was turbid when I looked at it. It looked smoky, cloudy.

Q. Now how long will the typhoid patient continue to discharge in the urine, typhoid bacilli?

A. Well, in his urine, after being perfectly certain that they were there in quantity, and were the source of irritation to him, I killed them in his urine by giving him urotropine. That is a drug which is broken up in the intestines, and as a result of this breaking up, formaldehyde is given off. Formaldehyde is destructive to and kills bacteria in urine. This can be done at any time, with any patient, without injury to the patient; but a series of experiments have been made and quite a number of men have been examined and although the typhoid bacilli disappear in the majority of the cases, soon after convalescence, still, they have been found as high as eight years afterwards in the urine of typhoid fever convalescents, 1284 or people practically well of the disease, and there is a surgical case recorded in which eighteen years afterwards, after the typhoid infection, the bacilli set up a suppuration in a bone, so that they were in the bone marrow, and caused a suppuration, an abcess in other words in that bone, and were there detected.

Q. The typhoid bacteria thrown off from a patient in his urine, who has recovered, apparently from that disease, but while it is still passing from his urine, would they be dangerous?

A. Yes sir.

Q. They are vitalized?

A. Highly vitalized, highly virulent.

Q. Is the origin of the typhoid bacteria known?

A. It is found in people sick and dead of the disease. It is found in the intestinal contents of people sick of the disease, and in people dead of the disease—in the cadaver; it is found in the lymphatics of the intestinal wall; in the intestinal follicles. It is found in the so-called mesenteric glands; in the spleen, in the liver, in the kidney, in the marrow of bones, and in the living subject it has been found floating in the blood.

Q. In the blood?

A. Yes, that is one of the tests for typhoid fever now.
1285 A definite quantity of the blood from a typhoid fever patient is taken out of him, and sown into broth, and the bacillus searched for and if found the case is typhoid.

Q. And if the bacilli are found he has—

A. He has typhoid fever.

Q. What if they be not found, is it an absolute test that he didn't have it?

A. No sir, we would make the experiment over and over again. One test itself is not enough. One negative test is of no value in making a diagnosis.

Q. I will ask you if it has ever been possible, so far as you know, to determine the absolute longevity of the typhoid bacillus in running water?

A. It is almost impossible to do it, and it is not known.

Q. Why is that?

A. Because the conditions which obtain in a running stream cannot be produced in the laboratory experiments, and to put living typhoid bacilli in the living water, a water that was being used by human beings, to drink, would be simply pure murder, so that the experiments cannot be made in a living stream.

Q. Now do other bacteria in the water prey upon the typhoid bacteria?

A. They do not eat one another.

1286 Q. No form of bacteria?

A. No sir.

Q. Does the action of anerobic and the aerobic bacteria in disorganizing organic substances in the water destroy the life of the typhoid bacilli?

A. That seems to be the reason why they disappear in the stagnant waters in our laboratory experiments, we find that when we take water for instance from the drainage canal, that it contains on an average of three or four hundred thousand bacilli to the cubic centimeter. We sow typhoid bacilli in this water and for the first two, three or four days the water bacteria not the typhoid bacilli, increased enormously, and use up the nutritive material in the flask for food. The results of this destructive action on the organic matter both solid and liquid in the water results in the production of poisons. True toxin and enzymes and these products seem to act not only deleteriously upon one another but upon the pathogenic micro-organism in the water also, so that we see in the laboratory experiments that the bacteria in the living waters die much quicker than they do in steril distilled waters, or than in river waters sterilized.

Q. But in the water in the running streams of course there is no means of judging of the results of that?

A. No, the conditions are these: That the toxins or products produced by water bacteria that are deleterious to 1287 the typhoid bacillus would be greatly diluted by the flowing water. Besides, typhoid bacillus is a mover, it can swim and get out of the way of anything that would be deleterious to it in a river, get out of the way of them, he can swim away.

Q. And that is the reason then that the typhoid bacillus can exist in water highly charged with sewage, because of the fact that he has motility and can move away from these toxins?

A. Yes sir.

Q. Which he cannot do in the laboratory experiment where he is confined?

A. No sir.

Q. Now, the speed of the water in which a typhoid bacillus should be placed, and the longevity of the typhoid bacillus are the two factors, are they not, from a bacteriological standpoint, that would determine how far by that current a typhoid bacillus would be carried?

A. Yes sir, speed and time are the important factors.

Q. And in making the estimate then in the running water where there was an active current, you would not as a bacteriologist consider as retarding, the distance to which the germ might be carried, in any manner by the extent of sewage pollu-
1288 tion that might be in the water up to the point where the sewage pollution did not interfere with the flow of the current?

A. No sir.

Q. Now, have you got a record there of the experiments you made as to the longevity of the typhoid bacillus in these waters?

A. Yes, sir.

Q. Would you please turn to them ? I want to put them in this record right at this place.

ATTORNEY GENERAL HAMLIN: Didn't he have that in once?

ATTORNEY GENERAL CROW: I think he did, in his general testimony but I want it put in the record right here.

A. I have here a table on the longevity of the typhoid bacillus in the steriled water. I have the original papers for all this if you want to submit them. Also here is the paper or book, where the records were made daily.

Q. Well, you can bring them down?

A. But I have got total results here on the paper? This is the chart.

Q. That is better.

A. This is for the third period of our investigation in
1289 1901. Longevity of the typhoid bacillus. Non-steriled water. Location.

Q. Well, now non-sterilized—

A. That is non-sterilized, that is living water.

Q. Then say non-sterilized or normal water?

A. Yes, sir.

Q. Of what streams?

A. These samples now were kept in a window facing south exposed to the sun, and I have a table showing the temperature number of hours of sunshine and the conditions of the water for that day. Another set were kept in a refrigerator at a temperature of 16 degrees centigrade.

Illinois & Michigan Canal Water taken at Lockport. The samples was collected on July 5th. The day's alive 4. We found it for four days. The water bacteria in the meanwhile had increased in enormous numbers. All other bacteria had decreased.

The Drainage Canal, Western Ave., Chicago, Date June 13th.

I must say that these samples were collected one day by my collector and inoculated by me the next day after collection. They were kept cold in the meanwhile.

June 13, days alive five, in the sunlight.

Days alive in the refrigerator June 13, seven days.

In the window, sample collected July 5, days alive seven.

1290 July 5th in the refrigerator eight days.

Drainage Canal—

Q. Now, wait a minute Doctor. What was the condition with reference to whether or not that water was polluted with sewage?

A. Oh, it is sewage polluted water.

Q. Was it what is termed bacteriologically, crude sewage?

A. Well, crude sewage would mean sewage floating in the sewer. It was a discharge of sewage mixed with water which contained over 500,000 bacteria when I got it, to the cubic centimeter.

Drainage Canal, Lockport, above the Controlling Works. Now this is above the Controlling Works.

In the window, date June 13, alive four days.

In the window July 5th, alive eight days.

July 17, in the window alive eight days.

In refrigerator, July 5, days alive ten.

July 17, days alive eleven.

Drainage Canal below controlling works.

Q. Now, wait a minute. What was the condition of the water in which these last experiments were made as to whether or not it was polluted with sewage?

1291 A. Oh, yes it was sewage polluted water. It was taken from the Drainage Canal above Lockport.

Q. Greatly polluted or slightly?

A. Oh, yes, it was greatly polluted. It was sewage containing anywhere from 500,000 to two or three million bacteria.

Drainage Canal below Controlling Works at Lockport, that is 9th Street Bridge at Lockport, samples collected on June 13th, and it lived in the refrigerator nine days.

The sample collected July 5th and put in the window was accidently broken.

Drainage Canal, Jackson St., Joliet. Sample collected by myself July 17th. Mr. Charles W. Bates was with me, the City Counselor. It lived nine days in the sunlight July 17th and lived 13 days in the refrigerator.

Illinois River above Peoria is the next place.

Samples collected June 13. Bacteria lived five days.

Sample collected July 5, Bacteria lived 10 days. In the sun this is, in the window.

July 11th, in the window lived eight days.

1292 In refrigerator June 13, lived 10 days.

July 5, lived 13 days.

Illinois River, bridge, Pekin. That is below the bridge. In window June 13, days alive four.

Sample collected July 5, days alive 10.

In the refrigerator, in the dark, same place, June 13, lived eight days.

July 5, lived 21 days.

July 17, lived 16 days.

Q. Is that in the sunlight?

A. That is in the refrigerator, 21 days there.

Chicago River, Adams St., June 13, in the sunlight lived four days.

In the refrigerator June 13, lived four days.

July 5, lived seven days in refrigerator.

The sample colected on July 5th and in the window was broken, I dropped it.

Tap, laboratory St. Louis, sample collected June 13, in window bacillus lived seven days.

In refrigerator bacillus lived twelve days.

Now, if you want the distilled and steriled waters indicated here we can put them in.

Q. All right, you can put them in.

A. Longevity or life of the bacillus typhosus in sterilized
1293 water?

JUDGE SPRINGER: I desire to enter an objection to that statement with reference to the longevity of the typhoid bacillus in sterilized water as no such condition can exist in reference to the case pending?

A. (Continuing) We have environments or surroundings, rather, and we have the three cultures, A B and C. Now, in distilled water in total darkness at 10 degrees centigrade, lived days—

A culture 51 days
B " 25 "
C " 22 "

Mississippi River water, Grafton. Total darkness, 10 degrees centigrade, days alive.

A Culture 59 days
B " still alive at the end of 65 days when this experiment was ended.
C culture 40 days

Drainage Canal water above Controlling Works at Lockport in total darkness, 10 degrees centigrade, lived:

A culture 45 days
B " 65 days, when the experiment ceased.
C " 22 days.

Missouri River at Bellefontaine, total darkness 10 degrees
1294 centigrade:

A culture 59 days

B culture 59 days
C " 57 "

Mississippi River water, Intake Tower, total darkness 10 degrees centigrade:

A culture lived 59 days
B " " 59 "
C " " 34 "

Distilled water, total darkness, 20 degrees centigrade, A, B & C cultures,

Distilled water

A culture lived 22 days
B " " 54 "
C " " 30 "

Mississippi River water at Grafton, total darkness, 20 degrees centigrade:

A culture lived 65 days
B " " 37 "
C " " 65 "

Drainage Canal above Lockport:

A culture lived 54 days
B " " 54 "
C " " 65 days and still alive when the experiment ceased.

1295 Missouri River water Bellefontaine, total darkness, 20 degrees centigrade:

A culture lived 65 days
B " " 65 "
C " " 57 "

Mississippi River water intake, total darkness, 20 degrees centigrade:

A culture lived 54 days
B " " 55 "
C " " 54 "

Distilled water, open window, months of July, August and September 1900. These experiments were all made in 1900. Distilled water, open window:

A culture lived 22 days
B " " 25 days

C culture lived 45 days

Mississippi River, Grafton:

A culture lived 65 days
B " " 45 "
C " " 60 days.

Drainage Canal, Lockport, open window:

A culture lived 40 days
1296 B " " 31 "
C " " 22 "

Missouri River, Fort Bellefontaine water, open window:

A culture lived 65 days
B " " 65 "
C " " 65 "

Mississippi River water Intake:

A culture lived 65 days
B " " 46 "
C " " 45 "

That is the end of that.

Q. Now, Doctor, I will ask you if you know whether or not any other bacteriologist ever made any experiment with these waters?

A. I don't know. I know that Dr. Jordan examined the longevity of the typhoid bacillus in the lake water. He is recorded as having had it live 90 days.

Q. Do you know whether or not any bacteriologist ever made any experiments as to the longevity of the typhoid bacilli in the Mississippi River water beside yourself?

A. No, sir.

1297 Q. Wasn't there a man at Minneapolis who made some experiments?

A. That was Westbrook, but whether he made any experiments on longevity of bacteria I do not know.

Q. He was the man that found typhoid bacillus.

A. He was the man that found typhoid bacillus in the water at Minneapolis?

Q. Now, what heretofore had been regarded as the effect of sunlight upon the typhoid bacillus?

A. Supposed to destroy it quickly.

Q. Was it ever successful, was its life ever successfully prolonged for any period of time beyond a few hours prior to your experiments?

A. Oh, yes, there have been experiments of this kind. Mr. Westbrook has made some himself.

Q. How long did he get it to live in the sunlight?

A. There was a conversation in which we discussed the question of the life of the bacillus typhosus in sunlight in living waters.

Q. Well, what is your scientific knowledge on the question?

A. I haven't any except what he has told me, except that this destruction of bacteria within a few hours in the sunlight or the destruction of the typhoid bacilli by sunlight in water, in a few hours, is a myth; it is not so.

1298 Q. Well, has the sunlight any effect on the longevity?

A. Yes sir, if they are exposed directly to the sunlight.

Q. What is that effect?

A. To destroy them.

Q. To destroy them?

A. Yes sir.

Q. What is the result of that as to what portion of the stream with reference to being light or dark or in the light, or coming into the darkness, would the typhoid bacillus naturally seek?

A. They would naturally seek the darker regions.

Q. Where would that be found?

A. It would depend upon the character of the water, whether it was turbid or not. The sunlight probably could penetrate to do them harm in the Illinois River, say one foot, probably not any more than that.

Q. Do you know at about what mean depth of the stream the change in the current occurs from the surface?

A. Well, I know that the surface of the river, that the water on the surface does not flow so fast as water just a foot or two below the surface, and that the water at the bottom of
1299 the stream moves much slower, so that there would be a
curve in the stream, representing the effect of air in retarding the flow of the water, and the effect of the sides and bottom upon the flow.

Q. The friction?

A. The friction. So that the curve would be—I have seen it demonstrated by Mr. Seddonys before the Academy of Sciences. It would be an O. G. or something like that.

Q. Well the fact is that the most rapid moving portion of the stream is at a point somewhere between the bottom and the surface?

A. Yes sir.

Q. And not either on the surface or on the bottom?

A. Yes sir.

Q. And the result of that would be, so far as typhoid bacteria is concerned, that if it sought shelter from the sunlight, that it would descend towards the more rapid portion of the stream?

A. Yes, unless it got to the bottom.

Q. Yes, unless it got too far down?

A. Yes sir.

Q. Now do you know whether or not any experiments have ever been made—in the first place, did you ever make 1300 any experiments for the purpose of determining whether or not the silt and mud and sand in the bottom of the stream will destroy the life of the typhoid bacteria?

A. Well, the artificial, laboratory experiments are difficult to carry out—

Q. No, I say in the bed of the stream.

A. I never made any in the bed of the stream itself. I have taken mud from the Drainage Canal at Brandon's Bridge, and mud from the river at Peoria and tried to ascertain the longevity of the typhoid bacillus in that, but it is almost impossible to obtain accurate results from those experiments.

Q. That is the fact which the circumstances surrounding it, render it impossible almost to accurately determine from actual experiments?

A. Yes sir.

Q. Now from your knowledge as a bacteriologist, and from the knowledge you have of the Chicago Drainage Canal, the Des Plaines River, the Illinois River, the Mississippi River, and the distances, and the speed of the streams, can you state whether or not when the water is running through the Chicago Canal, with the sewage running into it, bacteria could come from 1301 the Drainage Canal into the Mississippi River?

A. Yes sir. I think the bacteriological experiments indicate that bacteria discharged by the Drainage Canal especially in high river stages, are carried into the Mississippi River by way of the Illinois River.

Q. Well, do you say that as a fact?

A. Yes sir.

Q. Now from the same state of facts, above mentioned, as to the rivers and the relative geographical location of the Illinois River, the Mississippi and the Chicago Canal, etc., do you say, or can you say whether or not the bacteria coming out of the Illinois River, being discharged into the Mississippi River may or do enter the Intake of the St. Louis Water Works?

A. I think they not only may, but they do, and I base this statement upon the bacteriological investigation that has been conducted by me from 1899 to the present time, from special experiments that were carried out which lead me to assert that they do from the mixture of the waters that takes place at the Intake.

Q. Now can you state from your bacteriological examination, the average number of bacteria found in the Intake of the St. Louis Water Works?

A. For that 1900 period, I think it is 76,000—wait a minute —(Reading) Contain on an average of 72,600 bacteria—

1302 JUDGE SPRINGER: What period?

A. This is Mississippi River water, Intake, St. Louis Water works—contain on an average of 72,600 bacteria per cubic centimeter, and bacillus coli communis 62 per cent of the times.

JUDGE SPRINGER: You didn't state the time?

A. Mississippi River, taken at the Intake, St. Louis Water works, during this whole investigation.

JUDGE SPRINGER: Begins when and ends when?

A. That would begin January 23rd, 1900, and extending through that period to October.

Q. ATTORNEY GENERAL CROW: Now, is the bacillus, coli communis always a non-pathogenic bacteria?

A. Bacillus coli communis,—oh, no.

Q. Is it a pathogenic bacteria?

A. Yes sir.

Q. Does its presence always destroy the potability of water?

A. No sir.

Q. When does it destroy the potability of water?

A. I don't know that it ever does.

Q. Well, what is it about the bacillus coli communis that makes it contaminate water?

A. Well, I cannot say that it contaminates at all; it is an index of pollution.

1303 Q. Is the bacillus coli communis itself dangerous?

A. Taken in drinking water?

Q. Yes?

A. No sir.

Q. Is it never dangerous to the human being?

A. It is never dangerous to the human being, except when injected beneath his skin, or when it gets out into the blood stream or lymphatic stream from the intestinal canal. It is one of the most active causes of appendicitis.

Q. Is it the sole cause?

A. Oh no. It is probably the greater percentage of times, —it is the bacillus coli communis that is the cause of the inflamation in the appendix. Then besides, it appears in a great many secondary affections. It appears in an ordinary throat trouble, such as folicular tonsilitis, and in the secondary affections following typhoid fever. When this micro-organism gets into the blood, which it does sometimes, it follows up the destructive action of typhoid bacillus on the body. It produces very uncomfortable conditions.

Q. What are they; what are the symptoms?

A. The secondary poison that follows the affection of typhoid, or secondary fever that comes up after typhoid the great prostration emaciation, sweating, etc. that follow;
1304 in fact it produces a condition resembling some what typhoidal poisoning.

Q. They are caused by the bacillus coli communis?

A. Yes sir.

Q. And they are enabled to cause this condition by reason of the weakened condition of the system?

A. Yes sir.

Q. Which in the same person perhaps, in a normal state of health, it would not affect?

A. Yes, and sometimes they have been found in abcesses alone.

Q. They are injurious to any kind of an open sore, are they?

A. Well, no, I think not. An open sore is able to take care of itself.

Q. It throws them off, does it?

A. Yes sir.

Q. Then a large number of bacillus coli communis in drinking water is considered unpotable?

A. It is looked upon as an index of fecal pollution in a stream.

Q. Well, are they classed as pathogenic bacteria?

1305 A. They are not by the water bacteriologists, but by the pathologists, on account of the pathologic conditions which they produce, which I have already explained, they are classed as pathologic when they get into the tissues.

JUDGE SPRINGER: Pathogenic?

A. Pathogenic, yes sir; that would be the better word. You can say pathologic too.

Q. ATTORNEY GENERAL CROW: Can you state from your examination bacteriologically of the waters in the Intake of the St. Louis Water Works, the Mississippi River at St. Louis Water Works, whether or not that water supply is pure or impure, and if it is impure whether it is a menace to the health of this city?

A. Bacteriologically it is an impure water; it is not a potable water, and it is unfit for human consumption. That is, as it flows in the river.

Q. Do you know whether or not there is any difference of opinion among bacteriologists, as to whether or not the bacillus coli communis is one form of typhoid bacilli?

A. I think no true working bacteriologist believes that the bacillus coli communis is anything else than the bacillus coli communis, or that the typhoid fever bacillus is anything else than the typhoid fever bacillus. There may be varieties which approach one another closely, but it would be just the same thing

as asking an oak to become a maple, as to assert that a col-
1306 on bacillus could become a typhoid bacillus, so that has
never been experimentally shown by any system of treatment, that either micro-organism has been encouraged to change into the other—that a typhoid bacillus became a bacillus coli communis, or a bacillus coli communis became a typhoid bacillus.

Q. Now, I will ask you this question, doctor, is there any form of bacteriological life that is more highly vitalized than typhoid bacteria, except a spore form?

A. Some of the non-spore bacteria are more resisting than typhoid.

Q. What is one?

A. The bacillus prodigiosus is just a little bit hardier.

Q. Well, there are very few of them?

A. There are very few of them?

Q. It is considered one of the highly vitalized and hardy bacteria?

A. Yes sir.

AMAND N. RAVOLD.

ADJOURNED until 10:00 A. M., Tuesday, March 10th, 1903, at Southern Hotel, St. Louis.

1307 Southern Hotel, St. Louis, Mo. 10:00 a. m., Tuesday,
March 10, 1903.

Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD, resumed the stand for further direct examination by Mr. Jeffries and testified as follows:

Q. Dr. Ravold, distinguish the difference between the life of typhoid bacillus in bottles and in running water, if you can?

A. Well, water in bottles?

Q. Yes?

A. A series of experiments were made by us by placing the typhoid bacilli in various waters, steriled, distilled water, steriled river waters, or steriled waters rather from Lake Michigan, the Drainage Canal, the Illinois River, the Mississippi River, the Missouri River, and the laboratory tap. Then a

series of experiments were carried out upon living waters, that is, waters collected at Chicago in the Chicago River, and the Chicago Drainage Canal at Western avenue, the drainage
1308 canal at Lockport; in the Illinois River at Peoria and Pekin; in the laboratory tap water, St. Louis.

It was found that in the distilled water the bacteria lived—that is the typhoid—

ATTORNEY-GENERAL HAMLIN: Excuse me; hasn't this been introduced once?

THE WITNESS: Yes, but we are talking again now.

MR. JEFFRIES: Just state it briefly, doctor?

A. In distilled waters, the average time in total darkness, was 35 days, and in the open window, 31 days; while in the steriled waters the average time for the Mississippi River water at Grafton was—the lowest was 52 and the highest was 57 days.

Q. Days?

A. Yes, days, alive.

Drainage Canal at Lockport, the lowest was 31 days in the window and 58 days in darkness.

Missouri River at Bellefontaine, the lowest was 55 days. That was in total darkness, and in the open window 65 days That is when the experiment stopped.

Mississippi River water at the Intake, the lowest in darkness was 51 days; in the window 52 days.

Now, then, we will go on to the living waters—

Q. We went over that yesterday with you, but what I want you to do if you can is to distinguish the relative import-
1309 ance of these examinations with a view to determining the life of the bacteria in running water?

A. Well, to do that I will have to show you this table. The fact that the micro-organism lives in distilled water which contains no food—

Q. Then do it in your own way?

A. That is what I will have to do. I will have to make a large circle to reach it, to get to your question.

Now, we find that in distilled, steriled water, without food whatever, the bacterium lives a great number of days—the bacillus typhosus; that in a water from these rivers which have the bacteria killed in them, although they still contain many of the toxins produced by the bacterial life that was in the water; still, in these waters they live a great number of days. You see when some of our experiments stopped here, 65 days after the bacilli were put in the water the bacilli were still alive.

Then we go to the living waters. Now, in these living waters the bacteria—

Q. You mean in bottles?

A. Yes. These samples were collected at the various stations and shipped to me in ice. The bacteriological contents were obtained by plating. Now, it was seen in these ex-
1310 periments the numbers of bacteria ascertained in samples
shipped from these various points, throughout this investigation were. Now, into the water sample were sown typhoid bacilli, the attempt being made to sow typhoid bacilli and nothing else, no food with it. Now, in these living waters, the bacteria, the living bacteria, the so-called water bacteria, both in the window and in the dark ice chest where the bottles were kept, the bacteria increased enormously. In the window they increased much more rapidly than they did in the ice-chest, so that at the end of three or four days in the window, the maximum number of bacteria were reached. That is, from thousands they had increased to millions. The bacteria increased in the water because they had food there. When they exhausted that food as a result of their destructive activity, they stopped growing. That is one reason. And the other is that the toxins produced by them, the poisons that they produced as a result of this destructive activity, are deleterious to one another—in some cases killing directly.

Now, here we have a typhoid micro-organism which lived a number of days in distilled waters and other steril waters without bacteria, disappearing in a short while in living
1311 waters. However, the bacteria lived, as we saw, from
four days in the window to as high as 21 days in some of the samples. Now, what was the cause of this disappearance of these micro-organisms in the living waters?

Q. That is typhoid bacilli?

A. Typhoid bacillus that we had sown there.

Q. In the bottles?

A. In the bottles, in the living water, non-sterilized. The particular cause of the disappearance—there are various theories—

ATTORNEY-GENERAL HAMLIN: There are what?

A. There are a number of theories that have been advanced as the cause of the disappearance. First, planckton in the water. These are the lower form of animal and vegetable life that float in the water and are accused of feeding upon bacilli. This is not substantiated by any scientific proof. That is one theory.

The second is the absorption of food supply by the associated bacteria. Now, we saw that it is not necessary for the typhoid bacilli to have food to live. The distilled water experiments show that they live without food for a number of days in water. Then there must be something else in the water, and the next theory is the destructive action of the toxins produced by the associated bacteria, upon the typhoid bacilli and this undoubtedly is the cause of our inability to discover them in these experiments in the water for a number of days.
1312 Now, this lack of ability to discover does not mean that the bacteria were dead, necessarily. It means that we were unable to encourage them to grow artificially on the nutritive media that we supplied them. We don't say that the micro-organism in that flask if taken into the intestinal canal of a man would not grow. We simply mean that with our methods we are unable to encourage them to grow. Now, it is well known that it is impossible to produce in a laboratory experiment in a flask, the conditions which exist in a running stream, and that conclusions drawn from what is known to take place in a laboratory flask and applied to what is supposed might occur in a running stream, must be made with caution. As already stated, in the laboratory flask, the food supply is quickly exhausted by the associated bacteria. The toxins produced accumulate and remain, to the detriment of the typhoid bacilli sown in the water, but in the running stream these conditions do not obtain. The water is in constant motion, carrying away the toxins produced, the food supply is more abundant, and the bacteria less numerous, and the poisons produced by them greatly diluted, and as I said, quickly carried away, and further, the micro-organism can swim away inasmuch as it is motile—from uncomfortable surroundings.

1313 Q. Now, you are talking about the typhoid bacillus?
A. Yes, sir, the typhoid bacillus.

It would, therefore, seem that the conditions which make for the prolongation of the life of the typhoid bacillus in a running stream, would be more favorable than in the stagnant water of the laboratory experiment.

That is what you want, is it?

Q. That is it. Now state in your opinion, and from the examinations that you have made of the water in the canal, the Des Plaines, the Illinois and Mississippi Rivers, how long the typhoid bacilli would live in the running water in going from Chicago to St. Louis?

A. Well, drawing conclusions from the laboratory experiments we find that the bacteria live from four days to as high as 21 days —

Q. That is in a flask?

A. In the laboratory flask, in living, non-sterilized waters. Basing conclusions on them, I would be inclined to believe that the bacilli would live much longer in a running stream, living water, than that period.

Q. How much longer?

A. Anywhere from fifteen to thirty days, and that would be a very small limitation.

Q. A conservative estimate?

1314 A. A very conservative estimate.

Q. Now, you spoke with reference to the period in which the bacilli would be vitalized and capable of producing disease when injected into the human system?

A. Yes, sir.

Q. You are speaking of the typhoid bacillus?

A. Typhoid bacillus.

Q. Doctor, assuming that it requires the water seventeen days to run from the sewage openings at Chicago, down the river to the canal, the canal to the Des Plaines, the Des Plaines to the Illinois, and thence to the Mississippi; the intake at the Chain of Rocks, and thence into the reservoir, when in two days thereafter it is distributed and used by the people of St. Louis, what would you say with reference to typhoid bacillus discharged into the Chicago Drainage Canal through the sewage system of Chicago, finding its way into the water distributed to the people of St. Louis as above described, and be sufficiently vitalized to produce disease, and taking into consideration your actual experiments with the typhoid bacilli in connection with the water in the various streams through which it would run?

ATTORNEY-GENERAL HAMLIN: I object to that on the ground that the question fails to include the material facts sworn to by Dr. Ravold in regard to his experiments with 1315 the typhoid bacillus, and on the further ground that the question fails to assume that the typhoid bacillus was present in the waters of the Chicago River or Drainage Canal.

THE COMMISSIONER: Note the objection.

Q. MR. JEFFRIES: Go ahead, doctor.

A. Now, the time consumed, then, in traveling from Chicago, of the sewage would be 17 days in the river to the Intake and three days—that is twenty days. I think it highly probable from my experiments that typhoid bacilli discharged by the sewage system of Chicago into the Drainage Canal, could live—retain its vitality the while, enter the Intake of the St. Louis Waterworks, and be distributed to a user of the water sufficiently vitalized to cause disease in a susceptible individual.

ATTORNEY-GENERAL HAMLIN: Now, I move to exclude the answer on the ground stated in the objection to the question.

Q. Now, in connection with your answer to the last question and taking into consideration the great number of typhoid bacilli that come from a patient afflicted with the disease, and all other information that you possess on the subject—from the examination that you have made, what would you say with reference to the typhoid bacillus finding its way into the reservoir and water supply of St. Louis?

ATTORNEY-GENERAL HAMLIN: The same objection 1316 as to the previous question.

Q. MR. JEFFRIES: That is, assuming that these immense numbers of typhoid bacilli coming from a patient afflicted with the disease were discharged into the sewage at Chicago?

A. Well, do you want me to say whether I believe typhoid bacilli are in the Chicago sewage?

Q. No, that is not the question. The question is, assuming that they are there; that the bacteria, the typhoid bacteria—the immense number of them coming from a patient afflicted with the disease, are discharged into the sewage at Chicago?

A. Well, as I said before, I think it is highly probable that they could be carried into the Intake and reservoir of the St. Louis water supply, and retain their vitality meanwhile.

Q. Would they be sufficiently vitalized when found in the water supply at St. Louis to produce disease?

A. I think so. I would not like to try the experiment upon myself.

Q. State the length of time in your opinion the typhoid bacilli would live in the waters, running between the City of Chicago and the City of St. Louis, and being sufficiently vitalized when arriving in the water supply of the City of St. Louis to produce disease?

1317 A. I said 15 to 30 days. I thought I had answered that question. That is a conservative estimate.

Q. Doctor, explain the disappearance of bacteria in running water?

A. We find—take the drainage canal, for instance, at Lockport, where the drainage canal discharges into the Des Plaines River, we have great numbers of bacteria, ranging from 50,000 to many millions per cubic centimeter. A little lower down we find that there has been a decrease in that number. At Peoria we find a remarkable decrease sometimes.

Now, what was the cause of the disappearance of these bacteria which were in such large numbers at the drainage canal and lower down have decreased in number?

A number of theories are advanced. We have first—it was for a time thought that the mere aeration of the water and especially the agitation, shaking, would devitalize bacteria, but it has been shown by—

ATTORNEY-GENERAL HAMLIN: Doctor, would you just as leave put in there what you mean by aeration?

A. Aeration means adding air to the water, and it was thought that the oxygen of the air would injure the bacteria. It is known that the oxygen in the water causes the anaerobic bacteria to cease their activity, but the experiment, as I say, has shown that agitation and aeration do not kill the bacteria and consequently do not reduce the number.

1318 The next is dilution. Now, we find that the Des Plaines river and other rivers, as the water flows along from the drainage canal, are added to the total quantity passing over the dam. So here we have quantity of water. We can look at it in this way: if we have a quart of water containing 100 bacilli and we add 99 quarts of water to that one quart and shake it up we will have one bacterium to one quart of water. In other words, dilution removes the bacteria further apart, so that in taking a particular sample from that water we do get less numbers to a definite quantity of water. The bacteria, however, are all there, but simply removed further apart by the quantity of water that is added to it.

Next we come to the action of sunlight on the waters. During these experiments throughout we noted the conditions of water we collected on hot summer sunshiny days—sunshiny days in winter and on cloudy days in summer and winter, but there was very little difference noted in the numbers of bacteria in the samples collected, between bright sunlight shining on the stream and the gloom of a foggy day. And the depth that the sunlight can penetrate to the injury of bacteria is not very great. Of course, it is more in clear waters than in turbid waters and the actual depth to which the rays can penetrate to the injury—say of typhoid bacteria, we have shown
1319 by laboratory experiments, in a flask where the sunshine was on them all day on sunshiny days that they still retained their vitality quite a while. Now, those were summer days when the action of the actinic rays was said to be the most active. So that sunlight does very little towards decreasing bacteria in a given quantity of water.

Now, we come to the important consideration in the cause of the disappearance of bacteria, and that is sedimentation. Take sewage, for instance, discharged into a given quantity of water, if it be solid feces discharged into the water, part of the sewage immediately goes into solution, just the same as if you add sugar to the water. Other parts of it are solid and float along. Those particles are heavy, and if the stream is not too rapidly flowing, fall to the bottom and form the black muck on the bottom of the stream. These falling heavy particles carry with them the bacteria which follow them for food to the

bottom of the stream and break it up so that the mere falling of the sedimentary particles has something to do with the disappearance. Then the bacteria themselves are particulate particles. They have weight—not very great, that is true—but still those that can not swim are gradually carried to the bottom of the stream and we find in our experiments as I can show, that one or two feet below the surface quite a number of bacteria will
1320 be found, but down near the bottom of the stream much larger numbers are found, showing that these bacteria are carried down and are there alive. So sedimentation, then, has a great deal to do with the disappearance of bacteria in a running stream.

Now, this does not mean that the bacteria are dead. It simply means that they have been carried to the bottom of the stream and remain in the muck and slime at the bottom of that stream. These solid particles which are black, the feces or organic matter are broken up first, by the aerobic bacteria—those bacteria which live best in the presence of oxygen and the oxygen in the air in the water is soon used up, then begins the destructive and liquefying action of anaerobic bacteria which breaks up this material, and in the breaking of it up produce gases and these gases in septic tanks can be conducted off and used as gas to burn in a lamp, for instance. The gases that are produced by these bacteria are nitrogen, carbonide oxide, C.O.2, Metham's H.H.4, March gas and hydrogen. These last two burn easily. So that I say from a septic tank these gases can be conducted away and burned—these gases on the surface of the water—have been set on fire. I believe that happened on the Chicago River once.

Well, these bacteria then break up the food supply which is on the bottom of the river, and as it is liquified, it is
1321 carried along. If a stream is rapid moving, the bacteria are carried very much further. If the stream is a slow moving one or the water becomes stagnant, stands still, the bacteria eventually are precipitated to the bottom. Water flowing into a lake, for instance, would have large numbers of bacteria at the point of entrance of the stream, while at the point where the water passes out of the lake, very few will be found in a definite quantity of water, because the bacteria had fallen to the bottom. Not dead, but there.

Now, there is another reason given for their disappearance, and that is exhaustion of food supply. This depends on whether the food is exhausted, whether the sewage is all broken up in the stream before it gets to a definite place. That may have something to do with it. But, in my opinion, dilution and sedimentation are really the prime factors and the cause of the disappearance of the bacteria in a running stream.

Q. That what?

A. That sedimentation and dilution are the prime factors in the causation of the disappearance of bacteria in a running stream.

Q. What would be the effect of these bacteria that have gone to the bottom by the force of sedimentation in case or a freshet, a washout, or an increase in the flow of water
1322 in the river.

A. I said that the ordinary river water bacteria and sewage bacteria that are carried to the bottom of the river by sedimentation are not killed by that process and a freshet coming along would take them up and carry them further down the stream and as far as the velocity of the stream will carry them. If the river was moving slowly they would be deposited much sooner than if the stream was running rapidly, and this same reason can be applied to the pathogenic bacteria which lie in the mud and the slime at the bottom of the stream.

Q. Now, as particularly applied to the typhoid bacilli?

A. If they were carried to the bottom of a stream they would not necessarily be killed by that process and the first freshet that would come along or dredging boat or by whatever method this mud would be stirred up and put into the water the bacteria would be carried further down the stream.

Q. In this connection do you place any weight on th longevity of the typhoid bacilli?

A. Yes, sir.

Q. That would be quite a factor, wouldn't it?

A. Yes, sir.

Q. State, Doctor, whether or not the agitation of the water will cause the disappearance of the bacteria?

1323 A. No. Water has been shaken thoroughly and in some of the experiments it seemed to increase the numbers in the water, seemed to be favorable to growth, it would rather increase the number than decrease them if food were present.

Q. On that same principle, then, that would apply to a swift running stream?

A. Yes, sir.

Q. What did you say with reference to the disappearance on account of the planckton?

A. I spoke about the planckton in the water, that is the moving microscopic animal and vegetable life in the water. Now, some of those are infusorial life and it is contended that some of these infusoria take the bacteria into themselves and digest them. But take the Illinois River and the small number of infusoria in it, it would have very little effect upon the total number of bacteria in a definite quantity of water, if it were true that they do feed upon the bacteria.

Q. Well, what do you say as to that?

A. I haven't any personal knowledge as to that. That is an extremely difficult experiment to carry out.

Q. What do the various authorities say on the subject?

A. Some authorities seem to think that some of the infusorial life do take up the bacteria, but as I say that is an
1324 extremely difficult thing to prove.

Q. Well, there are authorities that take up with the opposite theory?

A. Oh, yes, there are others who believe nothing of the kind occurs.

Q. Doctor, you may at this time, I suppose, explain the method used in cultivating these typhoid bacilli that you experimented upon in the water of the Mississippi River and the canal?

A. Well, what you want to know is where I got my cultures that we used in the experiments?

Q. Yes, explain the whole process.

A. The typhoid cultures used in these experiments were:

No. 1. That in the living water experiments, that was received from Doctor F. F. Westbrook of the University of Minnesota. It was said to have been found by him in the living waters of the Mississippi at Minneapolis.

No. 2 came from a spleen sent to me by Dr. W. C. G. Kirchner from a patient dead of typhoid fever at the city hospital and was separated out by me in my laboratory July 8, 1902.

Now, that spleen when received was cut across a raw surface exposed under aseptic precautions and small particles of
it taken out, that is small particles were sown in broth
1325 and placed in an incubator. In the tubes a vigor-
ous growth of the bacteria occurred which in stained preparations showed a pure culture of a short, thick bacillus. This broth, some of it, was plated on two different kinds of media, that known as Elsner's medium or potato gelatine, and Hiss medium, that is a gelatine agar medium of a definite reaction. Now, the colony growth on both these media are quite characteristic of typhoid bacillus. Characteristic colonies were now picked off from the Hiss medium, and sown on the surface of slant agar agar in test tubes. A vigorous growth occurred and this growth was put through a series of special media and tested with the blood serum of a typhoid fever patient, in Widal's reaction, for the purpose of being certain that the micro-organism we were dealing with was the true typhoid bacillus. It proved to be a true typhoid bacillus both in form motility, in cultural characteristic and by Widal's tests.

Now, this bacterium on this slant agar grew abundantly and a loop, a planinum loop—I want to give you the size of that loop—well, it matters not. Three loopfuls of this growth upon the agar were taken off the surface of the medium, care being taken that none of the medium was scrapd up with the growth.
The growth was sown into living water in a flask, the
1326 water in the flask stirred up so that the bacteria were
disseminated throughout it and an attempt made by plating immediately to ascertain the number of typhoid bacteria to the cubic centimeter of water.

Now, then these flasks containing water from the various sources—each flask contained 200 cubic centimeters—were placed, some in a window facing south and others in an ice chest in the dark. Those exposed to sunlight in the window, the direct rays of the sun impinged full upon the western flask in the window at 10:45 a. m. and left the flask furthest east at 2:15 p. m. The total time of exposure daily being about 3 hours approximately to the sun of the hot summer days.

These experiments were made in June and July.

Now, each day a cubic centimeter of this water was taken out and plated in Hiss and Elsner media. The Elsner medium was kept at 20 degrees centigrade. The Hiss medium was put into an incubator at 37 degrees centigrade. The next day, that is 24 hours after, the colonies on the Hiss medium which looked like the typhoid colonies, having the colony characteristics of the typhoid, I should say, were picked off and sown upon slant agar agar. On the second and third days the same thing
1327 was done for the Elsner medium, for the colonies upon
the Elsner medium. When the typhoid bacteria began to be scarce or were few in number upon the culture medium, instead of at once plating in Elsner and Hiss medium the water was first sown in broth kept at 37 degrees Centigrade for 24 hours. A cubic centimeter of this broth was then sown into a broth containing Parietti's fluid, 5 to 7 drops of it to 10 cubic centimeters of broth in test tubes. The reason for this is, that acids such as carbolic and hydrochloric acid which Parietti's solution contains, prevent the growth of many kinds of water bacteria, while they do not interfere with the growth of the typhoid bacilli. After 24 to 48 hours' growth, depending upon the turbidity of the specimen in the broth tube, this broth was now plated again in Hiss and Elsner medium and studied for colony characteristics and the results here reported are the results of this work.

Now, then, the growths which were obtained on slant agar, were first studied for purity of culture, then stained for form, then sown in broth, litmus milk, glucose, agar and Dunham's solution for the production of indol. Besides this the bacteria obtained were tested with the Widal method upon blood
1328 serum that came from a patient just dead of typhoid
fever. It was discovered that quite a number of motile water bacteria agglutinated or clumped in this serum, in a solution of one part of blood serum to 30 of normal salt solution. On this account a series of tests were made with the dried serum. Definite quantities were weighed and mixed with a normal salt solution in varying proportions and it was found that in a dilution of one to 150, both the Westbrook and the Kirchner cultures would agglutinate firmly in one hour at 37 degrees centigrade.

So all suspected bacilli picked off the plates were made to conform to this test, dilutions of 1 to 150 for one hour, 37 degrees centigrade; otherwise rejected.

I have those tables, on the charts, if you care to have them. This is a resume of the work. I have a chart showing that work as it was carried on daily.

Q. You have them here?

A. I haven't them with me but I can submit them.

Q. That is the method that you pursued in reference to two tests or all of the tests that you made?

A. Well, for proving the presence of the typhoid bacillus in living water, in the experiments carried out in June and July, 1901.

Q. That is to prove its longevity in this water?

A. Yes, sir. 1902, that would be June and July 1902.

1329 In the other experiments where distilled water and steriled waters were used there were no other bacilli present, so that the mere plating showed the presence of the typhoid bacillus at once.

Q. And at all times?

A. Yes, whenever it was plated. It did not need the exhaustive method and the great care and detail that was so essential in this other experiment. By the way, this was my personal work. I did this myself, every bit of it, except collecting samples, and I collected two of those samples.

ADJOURNED until 2 o'clock p. m. same day, Tuesday, March 10, 1903.

1330 Southern Hotel, St. Louis, Mo., 2. p. m. Tuesday, March 10, 1903. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD.

Resumed the stand for further direct examination by Mr. Woerner.

Q. Doctor, this morning you were engaged in explaining a method used in your experiments with reference to the typhoid bacillus. Now, I will ask you to explain the method used by you in the examination and tests made for the bacillus in the waters of these various rivers during these various periods of examination?

A. You want me to begin at the beginning then?

Q. At the beginning, yes?

A. When I began the work it was apparent at once that an apparatus must be devised that would permit us to collect aseptically a specimen of the water from the river and that this apparatus must be a rigid one, a strong one, in order to collect
the samples in the Mississippi river, the Mississippi river
1331 and the Missouri river, on account of speed of the rapid
current.

This apparatus is the result of a great deal of thought on that subject by Dr. Kirchner and myself.

Q. Now, when you speak of this apparatus you have reference to complainant's exhibit No. 15?

A. Complainant's exhibit No. 15, yes. And with the aid of the machinist of the water department this apparatus was built. It consists of an oblong piece of metal having at its center concentrically arranged, 45 degrees apart, four small posts about 1-4 inch high. The diameter of this piece is 2 1-4 inches so as to hold the bottom of the bottle snugly. From either end arise perpendicularly two tubes 14 inches high, connected at the top with a cross bar and another cross bar 4 inches above the base. Along one of these erect tubes to the right is a clamp with a screw arrangement for tightening. This moves freely up and down upon the tube, allowing it to be brought snugly over the neck of the bottle and there clamped so as to hold the bottle securely. Now, arising from these two cross bars is a handle, or rather a hollow tube, 22 inches long, with a handle arranged at the top. Through this hollow tube a small solid bar passes with a trigger through the handle of the apparatus. This small bar connects with a clamp, which can be securely clamped to the
cork in the bottle. Between the lowest cross bar and
1332 when pulled up, the cork is removed from the bottle and
when the trigger is released the spring just mentioned
pushes the cork back into the bottle.

Now, instructions were given to the collectors. These were the instructions that were given to the collector, the directions for collecting bacteriological samples—they were written by me and typewritten by Dr. Teichmann's typewriter and each man received the instructions:

"The small bacteriological bottle has been sterilized and must not be opened in the air. Put the bottle in the machine and fasten the clamp tightly on the stopper. The stopper must not be taken from the bottle in making the attachment. Now plunge the collecting machine containing the bottle at least two feet below the surface of the water in that part of the river where the current is most rapid. Now pull the trigger in the handle which will lift out the stopper and allow the bottle to fill. When the bottle is filled remove the apparatus from the water, take the bottle out of the machine carefully and put a piece of tinfoil over the stopper and neck of the bottle. Over this put a piece of cloth, cotton domestic. Now tie a tag to the neck of the bottle bringing the ends of the string together and seal on the top. Now put carefully into the inside cylinder
1333 in the shipping bucket. Put cover on cylinder; then pack in ice. Close the lid of this bucket and seal."

Now, in this way, samples were collected in 4 oz. bottles, which were carefully sterilized in a dry oven at a temperature of 150 centigrade for over one hour.

Q. That is, the bottle was sterilized before the sample was collected?

A. The bottle was first sterilized, then it was wrapped in tissue paper, placed in a box and sent to the station where the sample was to be collected, and the instructions to the collectors were such as I have just read.

The sample having been collected it was shipped in ice. It was received at the laboratory and immediately placed against the ice, awaiting plating, which took place as soon as possible. So we see that throughout this investigation the water was collected in steriled wide mouthed glass stoppered bottles as I said, containing 4 oz. or about 100 cubic centimeters, with this apparatus which was designed, by us.

Now, when received at the laboratory and placed on ice the water in it was treated as follows:

The bottle was thoroughly shaken before plating, at least 25 times. The bacteriologists of the American Public
1334 Health Association say the bottle should be shaken 25 times in order to have the sediment and bacteria evenly

distributed throughout the water. Besides this shaking of the water air was blown through this so as to distribute the sediment throughout the water. Then one cubic centimeter was taken out and put into a Petri dish.

Now, I call attention to the fact that the water was put directly into the Petri dish and not into a tube. If it were found necessary to dilute the specimen this one cubic centimeter was mixed with nine,—99, 999 or 9999 parts, depending upon the experience of the individual who did the plating.

This was thoroughly mixed with the steriled distilled water with which this one cubic centimeter was mixed, and from that one cubic centimeter of water was taken.

In making the dilution the idea in mind was not to have more than 250 bacteria at any time growing upon a plate,—an ideal condition was 150 to 250 bacteria upon a plate.

The nutritive medium was then poured into the plate, mixed freely with the gelatine, put on a level surface and when the gelatine hardened, put into an incubator running at a temperature of 20 degrees centigrade.

1335 When the bottle was received in the laboratory, the seal was removed and the information upon the tag recorded in a book. The location, temperature of air, temperature of water, name of collector, and any other remarks that the tag contained were recorded. This tag was kept and put to one side and they have been exhibited here.

The cloth and the tinfoil were then removed and before opening the bottle the neck of it was heated in the free flame of a Bunsen burner to kill any bacteria that might be around the mouth of the bottle. Then, as I say, one cubic centimeter was taken and either plated directly or diluted—generally diluted from one to sometimes as high as 10,000, depending upon the number of bacteria that was supposed to be in the water. Two plates were made.

Now, in 1899, at the Chain of Rocks, they were kept in an ice chest and the temperature carefully watched—

MR. JOHNS: Do you mean in 1899?

A. Yes, in 1899, the samples were kept in an ice chest at the Chain of Rocks and the plates counted there at the end of three days.

In the 1900 period until May, the samples went to the St. Louis Medical College, bacteriological laboratory, and when the sample was plated the plates were put into a closet. The 1336 temperature ranges of that closet are here recorded in charts, showing that the temperature ranged from 18 to 20 degrees constantly. There was a slight variation, colder in the evening as a rule than in the morning. For a time the temperature of this closet was regulated by ice. In this closet were also placed vessels containing water so that the atmosphere of this closet was constantly saturated. When we removed to the old City Hall on Eleventh Street between Chestnut and Market Street, an old vault in this room was utilized as an incubator. It was carefully prepared, padded and had double doors. In this closet or vault were placed self-registering thermometers, the wet and dry bulb thermometer for recording moisture and ice.

The plates were placed in this chest at a height where it was found the temperature did not run over 20 degrees centigrade. At intervals of every few hours a record of the temperature was made upon a chart on the door. There were double doors on this vault and it was very easy to pass in and out without disturbing the air in it very much.

I think the average for the months from May to the latter part of October, of temperature in that vault was 19 degrees centigrade for the plates. The plates were kept for three days.

1337 Now, the idea of the moisture here was to have an optimum growth of bacteria and it was found that in a moist atmosphere the bacteria grew better than if the atmosphere were dry.

Now, the media in which these bacteria were grown was gelatine, the best Gold Seal gelatine was used, 12 per cent. having been found the best throughout this experiment and the reaction 1.5 per cent. acid phenol phthalein.

A series of investigations were made to ascertain the optimum reaction—or rather, put it the other way—the reaction which would give optimum results, and these are recorded in a table—in a series of tables.

Q. What do you mean by optimum results?

A. The largest number of bacteria that will grow upon a medium.

Q. That is the largest number?

A. The largest number that will grow.

Q. The largest number of any particular bacteria?

A. All bacteria that were in the water.

Q. Of all kinds?

A. Yes, sir.

1338 Now, here is a table showing the number of tests—or the number of tests showing the optimum growth on media of different reactions.

Location, Lockport.

Number of samples 3 at 1.5 per cent. acid.

I want to say, and for the benefit of the stenographers also, that where we say "Acid," if you will just put "plus" in front of the figure, it means that it took 1.5 per cent of acid in the media. While if you put minus in front of it it means that it was alkaline to the per cent that will be read.

Number of tests.

Lockport, 1.5 per cent acid, plus—3.

Number of tests at 2, the optimum reaction in which the greatest number of bacteria grew was 1.5 per cent.

Joliet. Medium containing 5-10 per cent acid, one test, 1.5 per cent acid,—2, and at 2 per cent, acid—1.

I can give the table to be inserted, and I can give the results, the table showing a summary of results of the growth of bacteria on media of different acid reactions.

The points from which these samples were taken—location, Lockport, that is, above the Bear Trap Dam, Joliet. 1339

Peoria,
Illinois River, Grafton
Mississippi River, Grafton
Mississippi River, Alton
Mississippi River, Hartford
Missouri River, Fort Bellefontaine
Mississippi River, Intake Tower
Reservoir at the Chain of Rocks
Illinois Shore, Chain of Rocks

Missouri Shore, Chain of Rocks

Tap

The total number of tests in a media showing a neutral reaction were five.

In media showing a 5-10 per cent reaction, were 4.
Medium showing a 1 per cent reaction were 5.
Medium showing 1.5 per cent acid were 35
Medium showing 2 per cent reaction were 20.
Total percentage in neutral medium 7.
In medium of 5-10 per cent reaction 6 per cent.
In medium of one per cent reaction, 7 per cent
In medium of 1.5 per cent reaction, 51 per cent.
1340 In medium of 2 per cent reaction, 29 per cent.

The best medium then was shown to be medium of a recation of 1.5 per cent acid for all of these waters in our experience.

JUDGE SPRINGER: I don't think we need any more than that. You have given the results of the table.

THE WITNESS: If the stenographers want that table I can tear it out and give it to them; the results are sufficient.

JUDGE SPRINGER: I don't think that is needed, the results are sufficient.

THE WITNESS: The results of this work extending throughout a year show that the medium which gives the optimum reaction was a medium 1.5 per cent acid, and this reaction was adopted throughout all of our work.

Now, with each plating, in order to discover any errors that might take place, one cubic centimeter of distilled water was always plated with gelatine. The number of bacteria that would grow upon this medium would show the errors that would occur. This was done especially during the summer months
on account of the heat in the laboratory and the fact
1341 that when air currents were blowing through the labora-
tory at all times in opening a Petri dish and pouring the water into it—the diluted water into it—and then the gelatine on top of that and stirring about, there was a definite time in which the gelatine was exposed to the air, and these errors were sought for and it was found that as a rule there were very few. The error was about 2 bacteria to a plate but sometimes as high

as 15 bacteria were found during the summer months when the atmosphere of the laboratory was so warm and wind blowing through. So as you see, the check was kept constantly upon our results.

At the end of three days the plates were counted depending upon whether they were not liquified before that time. Sometimes there are so many liquifying bacteria in the waters that they liquefy the gelatine before the end of three days. So the colonies upon a plate were counted at the end of 48 hours, or the plates placed on ice to retard the growth and counted at the end of three days This necessitated a daily inspection of plates.

Shall I congratulate the man that did this?

JUDGE SPRINGER: You might as well.

A. This work was very earnestly and efficiently carried out by my very able assistant, Dr. W. C. G. Kirchner, who did all
of the plating from January, 1900, to October, 1900,
1342 in St. Louis and in Joliet in the bacteriological labora-
tory located there from September 26 to November 27; at the St. Louis Medical College from January 23rd up until May, two men, Dr. W. C. G. Kirchner and Dr. William H. Rush plated samples so that four plates were made from each sample of water that came in, each man preparing two plates and each man counted the other man's plating—

Q. Besides counting his own?

A. Besides counting his own, and the average of those countings were made. When we removed to the old city hall the work came entirely under Dr. Kirchner's care and the quantitative determination of the number of bacteria per cubic centimeter—a series of tests were also made constantly with all media prepared.

A lot of gelatine is prepared and labeled 1, 2, 3, and consecutively to the end of the investigation and a series of plates were made to ascertain upon each medium the decrease or the increase of percentage of growth between the two kinds of media, a very simple algebraic formula—B minus A, divided by A,
very easily gave the percentage on the plates of increase
1343 or decrease of each medium. Five litres of media of
gelatine were made at a time. It was stored in flasks.

The top of the flask was sealed with tinfoil. This allowed very little, if any, evaporation of water from the medium. When needed the medium was immediately tubed and sterilized, so the medium was always fresh and new when the platings were made with it. In the intervals it was kept in the ice chest near the ice,—little evaporation was possible taking place. It was kept in a saturated atmosphere and these records, if you care to have them, go in there—it makes a series of very long tables—

Q. No, you have given your results.

A. Yes. I have not only had the total results given, but I have had charts prepared showing this increase or decrease in the respective media as they were made.

I can give the method of making that media. It is one adopted by the American Public Health Association Bacteriological Committee.

Now, I want to say that this media up to the 1899 period was prepared by Dr. W. C. G. Kirchner. In the 1900 period, from January until May, it was prepared by Dr. Kirchner, Dr. Rush and Mr. Martin Schmidt, who was the janitor of the
1344 laboratory at that time.

Schmidt was an educated man, was trained in the laboratory methods and after three months was found skilful enough to prepare this medium, and probably is to day one of the most skilful media makers in the world, for his experience is as large as anybody's. He prepared all media from May until the end of the work in 1900, and during the 1901 period prepared all media used in the St. Louis laboratory.

The solutions of hydric oxide and hydric chloride that were used in these experiments were prepared by one man, tested by several, myself and my assistants before being used upon the medium.

I would like to give the method of preparing that medium.

Q. Well, that is what I want.

A. To make gelatine, it is first necessary to prepare broth. Broth in this laboratory was prepared in the following manner.

To each 500 grams,—1 lb.—of finely chopped lean meat add one litre of distilled water and allow it to macerate in a cool place from 18 to 24 hours; strain the infusion and press out the juice at the end of that time, using a cloth or a meat press.

Make up to the original quantity if necessary by the ad-
1345 dition of water, and after adding one per cent of dry
peptonenittes and five per cent of sodium chloride to the
filtrate measure the height of the fluid in the vessel or weigh it
on a balance.

Third: Heat over a water bath for 25 minutes and then boil for five minutes over a free flame. When all the ingredients are dissolved rendering the mixture slightly alkaline to litmus by the use of a normal solution of sodium hydroxide.

Fourth: Add water to make up for the loss of water by this cooking. Allow it to cool. Filter in standardized stock. If nutratitive broth to be used, fill in flasks or tubes and sterilize. Keep all the stock broth in a cool dark place and protect the mouth of the flask with tinfoil to prevent contamination or evaporation.

To nutrient gelatine and the broth stock here made is added two per cent of Gold Seal gelatine or a good quality of gelatine or when making up a lot directly from the meat infusion described in the preparation of broth proceed as in the first article, adding the gelatine with peptone and salt. After measuring the fluid heat over a water bath for 25 minutes and
when the gelatine has dissolved render the mixture
1346 slightly alkaline to litmus by the addition of the 4 per
cent solution of sodium hydroxide. It will then be practically neutral to phenol phthalein. Allow it to cool in a temperature between 45 and 50 degrees centigrade and for each litre stir in the white of one egg mixed with water; make up the loss due to evaporation by the boiling of the water and test to see if the reaction is slightly alkaline to litmus. Boil for five minutes over a free flame, stirring to prevent scorching and to make up the original quantity by the addition of water. Filter through filter paper or cotton, measure the filtrate and test the reaction and standardize to 1.5 per cent with phenol phthalein as an indicator in the titration. Fill in test tubes and when properly plugged sterilize for 15 minutes on each of 3 successive days, or once for 15 minutes in an autoclave under 6 lbs. pressure. The medium should now be perfectly clear and should remain solid at 24 degrees centigrade. Keep the standardized stock media properly labeled in a cool dark moist place.

Now, this is the method of preparing the gelatine which was used throughout this investigation.

1347 In the second period instructions were sent to the bacteriologists, typewritten—at Grafton, Peoria and Joliet. The gelatine was not prepared in St. Louis and shipped to them, but the test solutions for titrates on phenol phthalein were prepared in the St. Louis Laboratory and sent to each laboratory, the bacteriologist having been instructed in the St. Louis laboratory before going to their respective stations, upon the method of making this test and the color of the indicator desired.

In counting bacteria and in recording results the following scheme as arranged by Fuller and Johnson was adopted. Mr. Johnson was a member of our laboratory staff and was the originator of this method—he and Mr. Fuller.

The number of bacteria absolutely in a water are almost impossible to obtain. The idea is to have the greatest number that will grow upon a nutrative medium and this nutrative medium which we prepared and kept at a certain temperature under moist conditions brought about optimum results, so that the number on this medium is relative and not absolute.

Now, in order to facilitate the counting the number of bacteria per cubic centimeter, from 1 to 50 were recorded
1348 to the nearest unit.

From 51 to 100 were recorded to the nearest 5.
From 101 to 250 to the nearest 10.
From 251 to 500 to the nearest 25.
From 501 to 1000 to the nearest 50.
From 1001 and over to the nearest 100.

Further, a series of experiments were made by collecting samples at the points from which samples in this investigation were taken, plating them immediately, collecting similar samples at the same time, placing them in ice and allowing them to remain under the conditions which would obtain in a sample shipped from a station to the laboratory. We plated directly otherwise and then at the end of a definite time plated again, in six hours, 12 hours, 24 hours, 36 hours, to notice the increase or decrease in the number of bacteria.

I can put these tables in, they are great big fellows.

JUDGE SPRINGER: Oh, no.

MR. JEFFRIES: It is of no use to go into these tables, Doctor.

A. But it was found that as a rule in samples tested during this investigation that there was a loss of bacteria
1349 in the majority of cases. In some cases there was quite a decided gain, reaching as high as 35 per cent in one case of gain and as high as the loss of 50 per cent in another case, so that the numbers during these months packed on ice would show a decrease in the samples collected from these particular points which you say you don't care to record in the table.

When the sample was received at the laboratory, tests were also made from it for the presence or absence of the bacillus coli communis. During this investigation several methods were used. In the beginning this work was entirely under my care. I did it. A method known as the Thiebold Smith method, by which a cubic centimeter of water was added to a Dextrose broth, and a fermentation tube was used. The bacilli coli communis in the presence of sugar breaks the sugar up into carbon dioxide and hydrogen forming these gases, and these gases collect over the fluid in the closed arm of the fermentation tube. If the bacillus coli communis is young and active, as high as 60 per cent of gas is produced. It was thought that this was a thoroughly reliable method in the beginning, but every fermentation tube whether it contained gas or not, was plated by me for the purpose of ascertaining whether the coli really
1350 grew from tubes that did not produce gases and it was found that occasionally this was so, and later an effort was made extending through quite a number of months for the purpose of ascertaining the reason why this is so and it was found that the older the bacilli coli communis becomes the more it loses its power to break up sugar and produce gases. So, after three months' trial of this method, although the results are comparable throughout that period, the method was rejected.

The next method tried was the Wertz agar method. In this method glucose and litmus are added to a nutrative material known as agar agar. One cubic centimeter of water was added to this material—in the presence of sugar the bacillus breaks the sugar up and forms a little air bubble and it also decolorizes the litmus turning the blue litmus red, so that it was easy to pick off the coli bacillus. It exploded the medium with its little gas bubble and also turned the litmus red around it. A little later along a different method was adopted. In plating on a Wertz agar plate, that is, litmus agar plate, a number of bacteria grew freely, spoiling the work—retarding the work.

1351 In order to prohibit the growth of water bacteria that would interfere with the results, Parietti's fluid consisting of 100 parts of water, 5 parts of carbolic acid and 4 parts of hydrochloric acid, were added to a glucose broth—10 cubic centimeters in a test tube received five drops of this solution. When the sample was taken from the bottle one cubic centimeter was put in with this Dextrose broth, first containing the Parietti's solution and put in an incubator and grown from 24 to 48 hours, depending upon the turbidity of the broth. It was then plated in Wertz agar. Any old bacillus coli communis that were present had been encouraged to grow in this nutrative media in a warm temperature, first from 24 to 48 hours and then after being sown upon the plate would explode the medium by the production of gas and also decolorize the litmus—not decolorize but turn the blue litmus red, and the colony characteristics were quite marked and they were easily picked off the plate.

This work and this method fell to Mr. Snodgrass, who carried that work out from January until the latter part of May, 1900.

In the second period, 1901, at the St. Louis laboratory, this work fell to Mr. Philip Damon, he using the same
1352 method in this period of 1901.

Mr. Philip Damon also did the quantitative determination of the number of bacteria per cubic centimeter of water collected from Missouri River at Fort Bellefontaine
Mississippi River at Alton
Mississippi River at Hartford
Mississippi River at the Intake Tower
Mississippi River, Missouri Shore
Mississippi River, Illinois Shore
From the reservoir at the Chain of Rocks.
Reservoir at Bissell's Point
The tap in the laboratory at 1141 Market Street
And the tap from Garfield Avenue.

Mr. Damon every morning went to the Chain of Rocks. As soon as the samples were collected by the collectors they were brought ashore and plated in a room set apart for him by the Water Commissioner at the Chain of Rocks,—the Chicago bacteriologist doing the same thing, plating at the same place,—samples taken directly from the river. Mr. Damon carried to this Chain of Rocks station a sample, first from the reservoir at Bissell's Point, and a sample taken from the Chain of Rocks reservoir and these were plated there.

1353 Mr. Damon was an extremely ingenious young man and devised a very clever receptacle for carrying plates after they were plated. They were then carried from the Chain of Rocks laboratory to the bacteriological laboratory at 1141 Market street. This apparatus as well as this collecting apparatus was adopted by Dr. Jordan in charge of the bacteriological work for the drainage canal.

First, after the micro-organism—coli bacillus, supposed to be—was picked off the plate, it was sown upon agar agar, and if the growth looked right it was picked off and sown in glucose gelatine, that is, gelatine containing 1 per cent. of Dextrose or glucose was inoculated with it, also a tube for the production of the indol and a litmus milk tube inoculated and these were studied afterwards for the identification of the micro-organism.

If gas was produced in the gelatine and the gelatine not liquified, confidence was felt that this was the colon, but the different tests—the test for indol and the coagulation of milk and the reddening of litmus were also noted. So each micro-organism was carefully studied culturally before it was identified positively or negatively as a bacillus coli communis.

1354 A great deal of special work was carried out in the laboratory, especially on the search for distinctive forms of bacteria in the waters of Lake Michigan, Chicago Drainage Canal, Illinois river, Mississippi river, Missouri river and Intake reservoir. This work fell to my very able assistant, Mr. Johnson, whose work has been here recorded in the charts and tables showing the species of bacteria collected at the various points mentioned.

Now for that coli bacillus the following features considered as diagnostic for the identification of this organism, bacillus true form, motility determined in broth cultures two days old, production of gas without liquefication of Dextrose gelatine, production of indol, coagulation of milk, reduction of nitrites to nitrates, characteristic fecal odor of culture—

ATTORNEY-GENERAL CROW: You are through with your method that you want to put in, doctor?

A. Yes sir.

Q. MR. JEFFRIES: Now, doctor, state the cause of typhoid fever and the manner in which it is conveyed?

A. The cause of typhoid fever is a micro organism which
was discovered by Ebert and Koch independently in the
1355 intestinal wall of cadavers dead of the disease and later
studied by Gaffky who had separated it out into pure culture, so that it is known as the Koch-Elbert-Gaffky bacillus, or the bacillus typhoid abdominalis or the bacillus typhosus, or the typhoid bacillus.

This micro-organism is found in the intestinal canal of people sick of the disease; in the follicles and lymphatics of the mucous membranes of the intestines; in the messenteric glands; in the spleen; in the liver; in the kidneys; flowing in the blood: sometimes in the rose spots or eruptions that occur on the skin; in the brain, and is discharged from the body in the feces and in the urine.

Now, no animal other than man suffers with typhoid fever and in order for him to have the disease it must be taken into the intestinal canal, either though the mouth or through the nose and through the throat and thus into the alimentary canal. In the alkaline fluids of the small intestines it finds a congenial habitat and grows and multiplies enormously, producing toxins which, coming in contact with the mucous membrane
of the intestines, especially the mucous membranes near
1356 the lymphatic glands or the lymphatic tissues themselves
cause an exfoliation of the superficial lying cells, making a way for the entrance of the micro-organism into the lymphatic stream and thus into the various organs which I have already described.

So then in order for a man to get the disease he must take the bacillus into his mouth. There are a variety of ways in which he can do this. Principally by drinking the micro-organism in the water contaminated with it.

There are other methods also by which it can be conveyed.

It has been shown that the micro-organism will live quite a long time in earth and that when this earth is dried and blown about as dust the micro-organism retains its vitality for quite a while in it and when this dust is blown around in the air, into the nose of the individual, and if it goes so far in the nose as to be carried into the throat and down into the stomach, or if a man be a mouth breather and takes the micro-organism directly into his mouth, it may be carried into the intestinal canal in that way. But that is just one of the very remote possibilities.

A second method is by direct conveyance from sick to well
in nursing an individual. Attendants waiting upon a pa-
1357 tient sick with the disease, in handling the bed clothes,
or soiled linen or other material about the patient may have their hands inoculated with it and thus convey it into their mouth by picking their teeth or picking their noses or without washing their hands go to table to eat food and in this way convey it directly to the mouth.

I had a bacteriologist working for me in my laboratory, working on feces from typhoid fever patients who acquired the disease in this way.

The blowing of dust from sheets or soiled linen about a patient may convey the bacillus into the atmosphere and thence into man. It may be carried in food, food such as raw oysters fed at the mouth of a sewer. This was shown by Conn of Wellesley. He showed that an epidemic of typhoid fever was produced by eating raw oysters which had been fed at the mouth of sewers.

Or the micro-organism may be conveyed by flies as was shown to be the case among the soldiers in the typhoid epidemic that broke out among those stationed at Chicakamauga and Jacksonville, Florida. Here it was shown that swarms of flies would feed in the latrines in which the dejecta of the men were thrown, but that as soon as the mess was served, the food cooked and served on the tables the flies left the latrines in

1358 swarms and crawled all over the food of the soldiers carrying the infective feces with them. The skilled man who investigated the Chickamaugua epidemic, Professor Vaughn, and others, were convinced that flies were instrumental in a large degree, in causing the epidemics, for the typhoid was conveyed from the latrines to mess, the flies flying from the latrines to mess two or three times a day, having upon their feet the infected feces.

And then another method of conveyance is by milk, any direct infection from the hands of people who nurse sick people having the feces upon their hands or men having a walking case of typhoid, having their own bacilli from urine and feces upon their hands and conveying it directly to milk or to water put in milk for the purposes of sophistication, the water having the typhoid bacillus in it. Milk is a good nutritive medium in which to grow the bacillus. They grow in milk without producing any apparent change in it, so they may exist in large numbers in milk and not render the milk offensive.

Now, these are practically the secondary methods of conveying it.

The primary method is by infected water.

Does that answer your question?

1359 It has also been conveyed by vegetables, raw vegetables, such as lettuce sprinkled with typhoid water, or celery. Celery properly cleansed, of course, would not convey it.

Q. Now, what is the usual method by which it is conveyed?

A. Infection by polluted water.

Q. Polluted with what?

A. With the dejecta of typhoid fever patients containing the typhoid fever bacillus.

Q. Now state, doctor, the effect of the degenerated bacteria upon the human system, that is the character, whether the typhoid germs that produce mild cases—

A. Well, there is a double question and there is a double barrelled answer in that. This requires two ways of answering it.

We have an individual on one side and a micro-organism on the other. The micro-organism is more or less virulent. The individual is more or less susceptible. In an individual not susceptible or a very little susceptible to the typhoid infection, if he had sown in him a very virulent typhoid bacillus he will have a very mild attack of typhoid. hardly incapacitating him for business. He is tired, he may have a little headache and things like that, but not so uncomfortable as to make him 1360 leave his work. In fact it was shown that among the soldiers at Chickamaugua quite a number who were affected mildly would rather attend to the military duties required of them than go to bed, and walked about with typhoid fever. Some of them were quite sick and walked about rather than go to the hospital.

If we have a virulent typhoid bacillus sown into a susceptible individual we have a very malignant attack of the disease which may end in death. So on the other hand, we may have a micro-organism whose virulency is greatly reduced, sown into a highly resisting individual and it will have no effect upon him whatever. It will pass through him and out or be killed in his intestines, or if it is a very weak micro-organism that is sown in an individual of very low resistance he may have a more or less mild attack of typhoid fever. Does that answer the question?

Q. Yes.

JUDGE SPRINGER: Will you state what you mean by susceptible to disease, that is to the typhoid fever?

A. I mean that a micro-organism taken into the individual grows. It may happen to any one of us, but we are able to produce in our bodies anti-toxin matters that destroy the 1361 poisons that are absorbed from the intestines and some of us are more able to produce these antitoxins, that is all, that is, they produce antitoxic substances in quantities sufficient to combine and destroy all the toxins conveyed by a given number of typhoid bacilli in our bodies. Others are not able to do this and when that condition obtains typhoid fever results so that there are varying degrees of susceptibility in an individual.

JUDGE SPRINGER: Susceptibility means then, a greater or less power of resistance?

A. Yes sir. I may say this, that an individual once having had the typhoid fever is generally immunized for life. A second attack of typhoid fever is a rare thing.

ATTORNEY GENERAL CROW: Now, we would like to have 10 or 15 minutes conference and then we may turn him over to you right here. We want to reserve the privilege of putting Dr. Ravold on with that map when we get it.

ATTORNEY-GENERAY HAMLIN: Certainly, that is all right. I think you can shorten this cross-examination by conferring a little, so we may as well adjourn.

Adjourned until 10 o'clock sharp the following morning,
Wednesday, March 11, 1903.
Southern Hotel, St. Louis, Mo.
1362 10:00 A. M., Wednesday, March 11th, 1903.
Continuation, pursuant to adjournment.

Present the Commissioner and same counsel representing respective parties.

DR. AMAND NICHOLAS RAVOLD

resumed the stand for further direct examination by General Crow and testifies as follows:

Q. Dr. Ravold, what is the most specific test for typhoid fever in the case of an examination of a patient?

A. What is known as Widal reaction, that is, taking the blood of a patient sick of typhoid fever and diluting it a definite number of times and the mixing with it a typhoid bacillus in broth of recent culture, and allowing the mixture to remain in an incubator for a definite number of minutes or hours. In the experiments which I have made, in which I have examined something like 6,000 specimens of blood from typhoid patients, I found—arrived at a definite method of working. The first thing to ascertain is the dilution necessary, a specimen of blood sometimes would clump in dilutions as low as one to 30 and others in dilution as high as 300, depending upon the amount of the clumping material in the blood and the age of the disease, that is, whether it is in the first week, second week or third week.

Now when the dilution is found that will give the best
1363 results with a stock culture of B. typhosus in an incu-
bator after one hour at a temperature of 37 degrees centigrade, that dilution is to be used for testing bacilli—And if the bacilli submitted do not clump under the given conditions they

must be excluded. This is the best known test for separating the typhoid bacillus from any other of the forms which resemble it.

Q. So there are many other forms of bacilli that resemble the typhoid germ?

A. Oh, yes sir, I have presented here in my table—I had a table here, a chart, showing the different varieties of bacteria found in the water at various stations on the rivers, lake and canal. We have what is known to us as the pseudo-typhoid group; that is bacteria which resemble in form and cultural characteristics quite closely the typhoid bacillus, but if when it was put to this severe test of clumping with the blood which was diluted a definite number of times it did not respond, then it was thrown out as not the true form, but belonged to the pseudo-typhoid group.

Q. Now, Doctor, did you make any experiments with water that came into the intake tower of the St. Louis Water Works between the 1st and 15th of February, 1900, and if so, was there any time at which you observed any special turbidity in that water?

A. Yes sir.

1364 Q. Just state?

A. Samples coming in between the 8th and 20th, on the definite date at that particular time, the samples were so markedly characteristic in appearance, from Peoria, from Grafton, from the Mississippi above Alton, Hartford and on the Illinois shore, and the Mississippi water from the Mississippi above Grafton, and the Missouri river at Bellefontaine, that the naked eye appearance of these waters was remarkable. Do you want me to say what they were?

Q. Yes.

A. The water at Peoria—samples of water sent to us for bacteriological examination from Peoria were almost black. The water at Grafton was as dark as that at Peoria. The water flowing down at Alton and Hartford was both black but showed a mixture with the Mississippi water that came in at Grafton, it was not quite so dark as that at Grafton and Peoria in the Illinois river, because,—the Mississippi at the time was covered with ice and was very clear, remarkably so.

The sample from the Missouri river at Bellefontaine was as

clear as I ever saw a sample of water from the Missouri River. The sample from the Intake Tower, the samples taken from the Missouri shore, Intake Tower,—was also clear. On
1365 the Illinois shore the water was dark. I never saw,—
the water of Illinois shore so dirty looking. The water of the Missouri shore to the naked eye was about the color of that in the Missouri river, but at the Intake Tower there was a distinct mixture of the Illinois water with the Missouri shore sample shown by comparing the samples from the three points, Missouri shore, Intake, Illinois shore. The bacteriological result at that same time showed a remarkable condition. These have been already exhibited in that long chart which I showed here, showing the number of bacteria at Peoria and at Grafton.

In samples of water from the Illinois river at Grafton the number of bacteria were very high. A lower number in the Mississippi at Grafton and the lowest number in the Missouri at Bellefontaine the mixture of that Illinois water with the Mississippi river water above the Missouri and the Mississippi river and the Missouri River water showing a distinct mixture at the Intake. That was shown bacteriologically in the chart I exhibited here.

Q. What was the distinguishing characteristic of the three bottles of water and where were the three bottles taken from?

A. The three bottles were taken one at the Missouri shore, one at the intake and the other on the Illinois shore.

Q. Opposite the Intake?

A. On a line across from the intake, not right at the intake. The Chain of Rocks runs out from the intake and at the end of it is the tower and the water sweeps down along that shore. It does not give a representative sample to take
1366 the water sweeping these rocks. We went up above where
the Missouri river water comes down the Missouri shore, a sample was taken at similar points on the Illinois shore, and a sample at the intake. That was taken in the tower at that time because we could not go out into the river in boats. We had to cut through the ice. Our men had to cut around through the ice to get these samples.

Q. What was the difference in the appearance of the water taken at the tower and the water on the Illinois and Missouri shore?

A. The water on the Missouri shore was fairly clear. The sample on the Illinois shore was dark, black. The sample at the intake showed about an equable mixture of these two waters, and this is demonstrated in the bacteriological examination.

Q. What period was this?

A. That was in February from the 8th until the 20th, I think.

JUDGE SPRINGER: What year?

A. 1900.

ATTORNEY GENERAL CROW: What relation did those dates have to the epidemic of typhoid that ensued in the spring of 1900, that you have heretofore testified about?

A. Within an incubation period the typhoid death rate ran
up rapidly in this town in March. Samples were collected
1367 in February, and in March 117 cases and sixteen deaths
by typhoid occurred in St. Louis, a phenomena that never
had occurred previously, and I believe has not since.

JUDGE SPRINGER: What was that? I didn't get that last.

A. No such a flare of typhoid in March has ever been recorded in the history of St. Louis, as followed this mixture of this dirty water at the intake.

ATTORNEY GENERAL CROW: Now, Doctor, I will get you to state whether or not you considered this water potable and safe for drinking purposes that comes from the intake tower of the St. Louis Water Works now without filtration or without boiling?

A. I do not.

Q. Do you use it yourself personally without boiling it or filtering it?

A. No sir.

CROSS-EXAMINATION,

By Judge Springer.

Q. I will ask you a few questions right on this point. What time, if you know, was the Drainage Canal at Chicago open for the admission of the sewage of Chicago?

A. Into the canal itself?

Q. Into the canal itself and into the Des Plaines River.

A. I have the date, January 17th.

1368 MR. DRENNAN: 1900?

A. 1900. I always understood that the canal was opened on that date. Mr. Harmon corrected me the other day and said January 16th, but as it is a question of 24 hours it doesn't cut much figure.

Q. Now, what was the date you said that you took these samples at Peoria, Grafton and the Missouri shore and the Illinois shore and the Intake to which you have referred?

A. Well, the samples as you will notice by these charts here—we began taking samples at Peoria and Grafton and these other points on January 23rd at all these points, so that the samples were constantly coming to us every day from all of these points. But after February 10th samples were so remarkably different at the intake tower, the Illinois shore and the Missouri shore from one another that it was marked at the bacteriological laboratory and my attention called to it.

Q. The samples taken then were fixed up and retained and exhibited?

A. These samples with the labels on them after the bacteriological tests were made were stored and kept and exhibited.

Q. What for?

A. They were exhibited before the Round Table Club. And also I delivered a series of lectures here before the Washington University Association upon qualities of water, water supplies and things of that kind, and I have exhibited them before a large crowd of people showing this mixture. 1369

Q. How long did this dark coloration continue?

A. It continued until the samples were thrown out.

Q. I mean in samples taken after the 10th of February?

A. While the river was high the samples from the Illinois river previous to that date, the 10th, were fairly clear, running back a definite time, but this remarkable difference in the water followed a thaw in the Illinois valley and a precipitation of a good deal of water,—this whole sweeping out of the Illinois river, came. The Mississippi still remained covered with ice and the Missouri river was covered with ice, this thaw not having reached round to the entire region, and until this thaw did reach the Mississippi River above, towards St. Paul, and finally sweep down onto the Missouri and the waters of all these rivers raised then this difference could be noticed. So at a particular time the Illinois river was high, this flood volume was very great and the Missouri and Mississippi rivers were low and the difference in the aspects of the water were recorded.

Q. Now, will you state the first marked condition of discoloration which appeared at Grafton and on the Illinois shore? Was it about the 10th of February, 1900?

A. Yes sir, it may have been a few days before that, but 1370 I think it was about the 10th. I did not make an absolute record of it.

Q. There was a high stage of water then in the Illinois river?

A. Yes sir.

Q. From the spring rise?

A. Well, it was a thaw you see, that was in February, January, and February are winter months.

Q. Well, if this Chicago Drainage Canal was first opened on the 16th of January there would be to the 10th of February—that would be twenty-five days, would it not?

A. Yes sir.

Q. Wouldn't that be about the time required for an ordinary flow of water from the Drainage Canal to St. Louis?

A. Well, our work upon the rivers indicated, and we are pretty confident about that, that the first discharge of the Chicago River through the Drainage Canal at the opening which occurred on the 16th or 17th of January, reached here by the 29th or 30th of January, and passed, at which time fortunately the Missouri River was very high.

Q. The Missouri river was high?

A. The Missouri River was high.

Q. In your opinion then did this polluted condition or 1371 discoloration in the waters at Grafton and on the Illinois shore to which you have referred, come from the ordinary drainage from farms and inlets to the river?

A. At the time I thought over that very carefully and looked over the samples microscopically and my conclusion was this, if you care to hear it—if you care to hear that conclusion.

Q. Yes.

A. I reached a conclusion. It was this. This mass of filth that was in the Chicago River and in the Drainage Canal while it was retained there, after the waters of the Drainage canal were allowed to stand or the waters of the Chicago river were allowed to stand in the Drainage Canal for a time without being discharged. The opening of the canal discharged the water over the dam and came rushing down the Illinois valley and traces of it could be seen with the unaided eye for a great distance as the water traveling along. The Illinois river was not high at that time. The greater part of the sediment was carried down by a sedimentation, making a black nasty mud in the stream. It was winter and the anaerobic bacteria were not at work. Consequently they had not destroyed the organic sediment. And then I also ascribed it partially to taking mud that was in behind the dams along the Illinois river and also the muck and slime and sludge that was put into the river by the opening of the Chicago River.

. CROSS EXAMINATION

By Attorney General Hamlin.

Q. Doctor, how long have you lived in St. Louis?

1372 A. All my life, with the exception of a few years.

Q. Were you educated here?

A. I was educated in the public school, the high school, the school of mines, Rolla, Mo., and Washington University.

Q. How long have you been practicing your profession as a physician?

A. Since 1881, I graduated from the St. Louis Medical College, and competed for a position in the St. Louis City Hospital and won. Was there 14 months. I was at the Poor House here for about 14 months, and have been practicing medicine ever since professionally.

Q. Now, the questions I will ask you, you can answer very briefly, and I wish you would make them responsive to the question. Just notice the question. How long have you been practicing or investigating on the subject of bacteria?

A. Since the year 1885. You mean, when did I take it up seriously and began to work at it. I worked at it indefiinitely when a medical student, then I worked along staining tubercle bacilli in sputum. That is an easy trick, any neophyte can do that. From 1885 I began the study of bacteriology.

Q. In 1885?

1373 *A. Yes.*

Q. Since that time you have devoted more or less time to that subject?

A. Yes sir.

Q. And during the last few years you have been connected with some college here as a lecturer on bacteria?

A. Yes, I was employed by the Medical Department of the Washington University, one of St. Louis' Medical Colleges, in 1889, as lecturer upon bacteriology, and before that time I was also—

Q. That answers the question.

A. Well, I had, lectured one year before that.

Q. You had lectured one year before that?

A. Yes, in the Shaw School of Botany.

Q. Have you kept up lecturing on bacteria since?

A. Ever since until last year when I resigned from the Medical Department of Washington University to go abroad.

Q. You are not now lecturing?

A. I have not lectured since May 1902.

Q. But from 1889 until May 1902, you have lectured more or less on this subject of bacteriology in the high institutions or colleges of St. Louis?

1374 A. Yes.

Q. Now, in 1899, you took some samples of the water here, didn't you?

A. What water?

Q. Mississippi River Water.

A. Yes.

Q. At the Intake?

A. Yes.

Q. How many samples did you take?

A. I cannot speak from memory, I can give you the exact number (refers to memorandum). During this period 1899 34 samples of water were collected at the Intake near the water works.

Q. 34 samples?

A. Yes, sir.

Q. Was that all the samples you took in 1899 at the Intake?

A. Yes, sir.

Q. Who assisted you in collecting these samples?

A. Dr. W. C. G. Kirchner.

Q. Is that all?

A. These samples I said were for the quantitative determination of bacteria.

Q. You are not asked that question. Is that all?

A. That is all.

Q. Now, you took the samples in 1899 from where?

1375 A. 32 samples in different parts of the Mississippi and Illinois River.

Q. I will go back to the Intake. From what period of time were these 36 or 38 samples?

A. 34 samples.

Q. Over what period of time were these 34 samples taken?

A. August 10th to September 25th.

Q. That is all the samples that you took in 1899 at that place?

A. No, it is not.

Q. All right, go ahead.

A. These samples were taken for a definite purpose.

Q. I didn't ask you the purpose.

A. There were other samples taken until January, through until January at the Intake Tower.

Q. Have you testified about these?

A. I have not.

Q. All the samples you have testified about then are the 34 samples that were taken from the Intake Tower from August 10th until when?

A. Until September 25th.

Q. Now, state, the next place that you took any samples and the number of them in 1899?

1376 A. Now, besides these 34 samples—

ATTORNEY GENERAL CROW: I submit that the witness has the right to answer the question in his own way.

THE WITNESS: I want to answer the question my own way or I can't answer it at all.

ATTORNEY GENERAL HAMLIN: Dr., the questions are easily understood. I will withdraw the question.

Q. If you took any samples on the Missouri shore from the Intake Tower in 1899, you may state how many you took?

A. The Missouri Shore sample, that is the nearest to the Missouri Shore, was Mississippi river just above the Intake, that would be Missouri Shore sample taken in 1899. There were nine of these taken.

Q. Nine?

A. Yes sir.

Q. Is that the same point that you took samples designated on the Missouri shore or at the Missouri shore in 1900 and 1901?

A. No sir, we took them closer up there in the period of 1900 and 1901.

Q. You may state where you took them in 1899 again?

A. We took them above the Intake of the St. Louis Water Works, on the Missouri side of the Intake, near to the channel.

Q. How near to the middle of the channel of the river 1377 is the Intake Tower or the Intake?

A. The Intake Tower is pretty near the middle of the channel.

Q. On the Missouri side?

A. On the Missouri side.

Q. How many samples did you take on the Illinois shore in 1899?

A. One.

Q. One sample?

A. Yes sir.

Q. Who assisted you in taking the samples on the Missouri shore, as you described, above the Intake tower?

A. Dr. Kirchner.

Q. The same man?

A. The same man.

Q. Who assisted you on the sample you took on the Illinois shore?

A. Dr. Kirchner.

Q. If you took any samples during 1899 at Bellefontaine, you may state how many?

A. We did not. We did not go up to Bellefontaine.

Q. Did you take any samples in 1899 below Alton?

1378 A. We did.

Q. What place?

A. Above Alton.

Q. Below Alton?

A. The Mississippi River, and above the mouth of the Missouri.

Q. We don't know what place it is.

A. We took them below Alton between the Chain of Rocks and Alton.

Q. Below Alton and before you reached the mouth of the Missouri?

A. Madison Landing September 9th and 16th, September 25th, half way between Alton and Madison.

Q. Now, you call this Madison Landing?

A. Yes.

Q. September 9th?

A. September 9th, 16th and 25th, I gave you these dates.

Q. Who assisted you?

A. These samples were taken from a boat and I think I collected these samples myself, at least two of them. I think the 29th and 16th I collected myself from a boat in the river, 1379 and I think this one of September 25th was collected by Dr. Kirchner, we were both on the boat together.

Q. Well, now have you taken any samples—

A. There are other samples taken below Alton.

Q. I am speaking of the ones you have testified about?

A. Yes, but there are some others below Alton half way between Alton and the mouth of the Missouri River, there is another sample.

Q. I haven't come to that yet.

A. These were all below Alton.

Q. But at this particular point I am asking about now, I don't care so much about the other. Now, if you took any samples in 1899 above Alton, how many did you take?

A. We took Mississippi River opposite Clifton September 25th, one sample.

Q. Above Alton?

A. Above Alton.

Q. How far above Alton?

A. Really, I don't know how far Clifton is above Alton.

Q. It is above sewerage, of course?

A. Yes, it is up there opposite the Illini Island Club, that is above Alton about four or five miles, I don't know
1380 exactly how far.

Q. Who assisted you in taking that sample?

A. On September 25th I didn't take it myself, that was taken by Dr. Kirchner, Mississippi River one mile above Alton.

Q. I haven't asked you about that.

A. You asked me above Alton and I answered that question. I have got three different points above Alton from which samples were collected.

Q. You can give me any one of them of that number?

A. Mississippi River only a little above Alton.

Q. How many samples.

A. Two. September 9th and 16th, collected I think by myself, Mississippi River 3-4 of a mile below—

Q. That is above Alton is it?

A. I am not so sure about that, I think it is though. Yes, I am pretty sure it is.

Q. How many samples.

A. One sample September 25th, Mississippi River one mile below Grafton.

Q. How many samples?

A. One, September 9th.

1381 Q. Now, that is all the points above Alton on the Mississippi and below Grafton, that you took any samples in 1899, about which you have testified?

A. Yes sir.

Q. Now, then how many samples did you take in the Mississippi river above Grafton in 1899?

A. The Mississippi river opposite Grafton.

Q. How many samples?

A. We took two samples, September 6th and 9th, I collected those myself, Mississippi river four miles above Grafton, September 6th one sample. Mississippi river six miles above Grafton, on September 6th, four samples. Now, then there were two collected, Mississippi river one mile above Grafton, September 21st, Mississippi river 4½ miles above Grafton, September 21st, one sample.

Q. Is that all?

A. That is all, sir.

Q. In 1899?

A. In 1899.

Q. How many samples did you take in 1899 on the Illinois river above Grafton, that is immediately above Grafton or at the point where you took them?

1382 A. Illinois river just above Grafton, sample was taken September 9th, Illinois river, 1½ miles above Grafton. September 21st, one sample Illinois river.3 miles above Grafton Wheeler's Ferry. September 6th.

Q. Is that September 6th?

A. The first one was September 26th, Wheeler's Ferry, and September 21st Illinois river five miles above Grafton, Brick House Club September 6th, one sample, September 21st one sample Illinois river 7 miles above Grafton.

Q. Is that all?

A. That is all, sir.

Q. You got all the samples you took, that you have testified about, in the Illinois river above Grafton in 1899?

A. Yes.

Q. Now, where next did you take samples, in the Illinois river going up stream in 1899?

A. The Illinois?

Q. Yes?

A. This seven miles above Grafton, six miles I mean, that is the only sample.

1383 Q. That you have?

A. I find no other record of samples having been taken on these harbor boat trips.

Q. Dr., would you, as a bacteriologist, be willing to give an opinion as to the pollution or non-pollution of the waters out of the Intake for the year 1899, from the number of samples that you have now testified about in the cross-examination?

A. You mean as to the cause of the pollution, or whether it was polluted or not, the water at the Intake?

Q. Would you, as a bacteriologist, be willing to give an opinion as to the pollution or non-pollution of the waters out of the Intake for the year 1899, from the number of samples that you have now testified about?

A. I could give an opinion upon the number of samples taken out of the Intake at that particular time. I did.

Q. Would you, as a bacteriologist, be willing to give an opinion as to the condition of the waters in the Illinois river above Grafton in 1899, for that year?

A. For these particular samples at these particular times?

Q. No, for the year 1899.

A. Knowing the stages of the river, I could.

Q. Your opinion simply for the dates that you took the samples? 1384

A. Just upon the date that I took the samples?

Q. Yes, for no other time?

A. I couldn't give an opinion upon that of which I have not.

Q. From the samples that you took in the Illinois River in 1899, are you prepared to state what was the condition of these waters during that year, or any considerable portion of the year?

A. On none other than the time I took the samples.

Q. Would you, as a bacteriologist, state in your judgment as such, that that would be a fair test of the conditions of the water in the Illinois River above Grafton for the year 1899?

A. I would not.

Q. Do you know how much sewage was carried into the Illinois River from Chicago in the year 1899?

A. I do not.

Q. Do you know whether or not there was practically the same kind of sewage carried into the waters of the Illinois River from Chicago in 1899 as there is now?

A. I do not.

1385 Q. Do you know whether or not there was practically the same kind of sewage carried into the waters of the Illinois River from Chicago in 1899 as there is now?

A. I do not.

Q. You have no information on that subject?

A. No, sir.

Q. You made no examination for 1899 of the conditions of the water of the Missouri River at Bellefontaine or any point along the Missouri River?

A. I did.

Q. But none that you have testified to?

A. Yes, I have testified.

Q. I thought you stated that all of the examination of the Illinois River you testified about in your direct examination?

A. Yes.

Q. Doctor, I understand you to state that the primary cause for the disappearance or elimination of the bacteria known as typhoid bacillus is due to dilution and sedimentation?

A. Yes sir.

Q. What other causes do you give, besides these two?

A. I regard these two as the principal ones.

1386 Q. What others? You stated it yesterday?

A. The question came up; the question of aeration and agitation, sunlight, oxidation and exhaustion of food supply and planckton.

Q. Those are the other causes, all of them?

A. Those are the other causes that have been assigned by the various observers of water as the cause for the disappearance of bacteria.

Q. Do you recognize these causes also, the same as other bacteriologists?

A. I recognize planckton as probably having a nothing to do with it. I have no personal experience with it; hence can not make any definite statements. Some of the lower forms of infusorial life may take the bacteria into them as food. Sunlight upon a stream that was running in a very thin sheet over a wide expanse of country might have some effect upon the bacteria—the contained bacteria, but not as it runs in an ordinary stream. So I regard the two things, dilution and sedimentation as the principal causes for the disappearance of bacteria in a running stream.

Q. Don't you think sunlight has anything to do with it?

A. Very little.

Q. Very little?

1387 A. Very little whatever from our bottle experiments.

Q. Yes, but speaking outside of that, from your practical knowledge of the subject what would you say?

A. I have just answered that.

Q. You think not.

A. I have answered that. I said that if the river was spread out in a thin sheet over a wide expanse of country, as if the river should suddenly run out in a very shallow lake, and the sunlight upon it all day long might have some effect upon the bacteria, but that would depend upon the turbidity of the waters.

ATTORNEY GENERAL CROW: I want to ask a question for my own personal information.

JUDGE SPRINGER: Go ahead.

Q. He uses the term disappearance, and you use it. I want to know when you use it and he uses it if you use it with a similar meaning, that is to say are they destroyed or are they simply not found?

ATTORNEY GENERAL HAMLIN: Well, we will come to that.

ATTORNEY GENERAL CROW: Well, I want to understand your question and his answer. I think that is a fair proposition.

ATTORNEY GENERAL HAMLIN: I don't think it is a fair proposition to inject it into this cross-examination.

ATTORNEY GENERAL CROW: I don't think you ought to object to my asking what you mean by the question.

1388 ATTORNEY GENERAL HAMLIN: I think, gentlemen, when I get through on this line it will explain itself.

ATTORNEY GENERAL CROW: Then I will withdraw it as far as you are concerned and ask the doctor.

ATTORNEY-GENERAL HAMLIN: I will give you an opportunity after I get through with him.

ATTORNEY GENERAL CROW: I want to know what he means by it.

ATTORNEY GENERAL HAMLIN: Well, I will get him to enlighten you on that subject in a minute but I think I understand what he means and he understands what I mean.

THE WITNESS: You understand yourself and I understand myself.

ATTORNEY GENERAL HAMLIN: Yes.

ATTORNEY GENERAL CROW: That don't explain to me what you mean.

ATTORNEY GENERAL HAMLIN: I know, but it is between Dr. Ravold and me now.

Q. Now the turbidity of the water has something to do with it?

A. Yes, sir.

Q. Now, the water of the Mississippi River, is it in its natural stages, clear or turbid?

A. Now what do you mean by natural stages?

Q. Well, I will leave that to you, you are better posted on that than I am.

A. Do you mean that the water is running at a fairly aver-
1389 age stage in the river?

Q. That is what I think I mean.

A. The mean, between very high and very low.

Q. Yes, sir, the average, and when I speak of that, doctor, hereafter that is just what I mean.

A. All right sir.

Q. I guess that is right?

A. That is what I concede.

Q. Yes.

A. The Mississippi River above Grafton—now are you speaking of above Grafton or at the intake tower?

Q. Well, above the Missouri there you would get the waters of the Mississippi?

A. And the Illinois mixed.

Q. Well, take it above the Illinois River.

A. Above Grafton?

Q. Yes sir.

A. The waters there are fairly clear. The turbidity tests for a mean turbidity is in the chemistry report but the naked eye appearance is all I know about it and from having swam in the water and sometimes having rowed a boat in it.

Q. You say it is fairly clear?

A. It is fairly clear water.

Q. Now take the Illinois River above Grafton. How is
1390 that for turbidity?

A. That is a darker water or blacker water than the Mississippi as a rule at the times I have seen it.

Q. In the ordinary stages?

A. In the ordinary stages.

Q. Well, now, how is the Missouri River water?

A. It is a turbid water.

Q. Then the effect of the sunlight as an element of the disappearance of the typhoid bacillus would be less on the Missouri River than it would be on the other two rivers in your judgment?

A. Yes sir.

Q. What is the effect of sunlight upon this particular germ, the typhoid germ?

A. Exposed directly to sunlight, growing upon a medium it is destroyed in a few hours, but growing in our water experiments, we found that exposed to direct sunlight in a bottle containing 200 cubic centimeters, in what is known as an Erlenmeyer flask, a beautiful clear glass, with the direct sunlight of hot summer days on it, it had lived as long as our experiments lasted, in distilled water, that is the pure water of the laboratory, perfectly clear. It lived from the data I have as high as 55 days I believe, while in the direct sunlight, in waters from the various stations it lived as high as 65 days, exposed to the
1391 direct sunlight for a number of hours a day.

Q. Will it live longer in darkness than it will in light?

A. Yes sir.

Q. Will it live longer in turbid waters, testing it by the sunlight, than in clear water?

A. Our experiments show that it has a little longer period of life in highly turbid waters than in very clear waters, the difference being a few days, five or six, I believe, in these experiments.

Q. Now, Doctor Ravold, have you travelled from Bear Trap dam down the Illinois River to Grafton?

A. No.

Q. You have been at Joliet?

A. I have been at Joliet.

Q. How is the water of the Drainage Canal discharged into the River at Joliet or above Joliet wherever it is?

A. At Lockport do you mean?

Q. Yes. Take immediately above Bear Trap dam, what is the character of the channel?

A. The Des Plaines River and the waters of the Drainage Canal discharged into it come together at Lockport. The water in the Drainage Canal is what you want, is it?

Q. Yes.

1392 A. The waters in the Drainage Canal are fetid. There is a foul smell, foul odor.

Q. I am not asking about the character of the water but as to the channel—the channel at that point?

A. Now the water discharged over the Bear Trap dam runs down and meets at middle stages a fairly clear stream of water, that is the Des Plaines River. The two commingle and rush along, falling some 38 feet in four and a half miles to Joliet.

Q. Now, I want to go back a little. Above Bear Trap dam, if you know, what is the character of the channel, of the water and the banks and how wide is it and whether it is through stone or free soil or how is that, or whether you know it?

A. Yes, I have been there. I have been all over it with the chief engineer at that point. Some distance back I understood the canal was 160 feet wide and some 38 feet deep with perpendicular walls cut into the solid rock.

Q. How far above Bear Trap dam is that?

A. I should say that is a thousand feet above Bear Trap dam.

Q. And how far is the channel cut through the rock in the manner that you have described?

A. I don't know.

Q. And have no idea?

1393 A. Yes, I have an idea but it is all gathered entirely from the reports of the Drainage Canal engineer.

Q. Well, now, it passes over Bear Trap dam and joins the waters of the Des Plaines River?

A. Yes.

Q. And the stream is rapid and the fall is 37 feet.

A. Yes sir.

Q. To Joliet?

A. Yes sir.

Q. At Joliet there is a lake, isn't there, a basin?

A. Well, before it gets to Joliet—

Q. Wait a minute. Of the Illinois waters?

A. Of the Illinois and Michigan Canal, that comes into it and altogether flow along to Joliet. The water spreads out there for quite a distance, I suppose 300 yards.

Q. Yes.

A. And part of it is run through turbines, for power and the other part runs over a little dam.

Q. How large a pond or lake is that at Joliet?

A. Well, this is guessing. I should say that the river there is 200 feet wide and that spread of water about 1,000 feet long or longer than that, anywhere between one and two thousand feet.

Q. Is there a dam in the river?

1394 A. I don't know whether there is a dam there or not. There must be because there is a water fall.

Q. There is a lake there, isn't there?

A. There is a wide spread of water, yes.

Q. Well, you would call it a lake or a pond or a basin, wouldn't you?

A. I would hardly call it a lake. The water is a little too fast in it.

Q. Did you ever test how long it took any object two or three feet long and two or three inches thick to pass out of that lake or pond into the river below?

A. I have not.

Q. Well, there would be a good deal of sedimentation there, wouldn't there, doctor?

A. From the bacteriological results there is very little.

Q. Well, do you say whether there is or is not any sedimentation there?

A. There is some sedimentation. There must be.

Q. Did you ever examine as to the amount of sedimentation there?

A. I did not.

1395 Q. You made no examination?

A. I made no examination.

Q. At no time?

A. Other than the bacteriological samples collected in cross section there.

Q. Through the pond?

A. Through the pond, yes.

Q. About what part of the pond?

A. That would be about above the power house, that is above Jackson Street, is it not, Mr. Randolph?

MR. RANDOLPH (Chief Engineer Sanitary District of Chicago): Yes, Jackson Street is at the dam.

A. (Continuing) At the dam, yes. We collected samples about through what would be the center of that so called lake that you speak of. We took cross sections across that stream to find where the best sample could be taken in the channel of it.

Q. When did you take these samples?

A. In 1900 and 1901.

Q. You took none in 1899?

A. None whatever.

Q. You wouldn't undertake to say how much sedimentation was there then?

A. No sir, except bacteriologically.

1396 Q. That is examinations from samples?

A. Yes sir.

Q. Your system of settling basins here in your water works system is a system of sedimentation, isn't it?

A. Yes of deep tanks.

Q. In passing down the river from Joliet do you know where and at what place you strike the next pond or basin or lake?

A. I do not.

Q. Were you at La Salle?

A. No sir.

Q. Didn't go up to La Salle?

A. I did not personally.

Q. La Salle is below Joliet, isn't it?

A. Yes sir.

Q. You never examined the basin or lake of La Salle?

A. I never have, personally.

Q. You know nothing about it?

A. I know nothing about it personally.

Q. Assuming that there was a lake as large or larger than the one at Joliet, and that the water moves slowly, the current at this point, and through this lake or basin, would you say that there would be a sedimentation?

A. Yes sir.

1397 Q. Did you take any samples of water at La Salle?

A. Yes sir.

Q. What year?

A. 1901 and in part of the period—no, 1901 entirely.

Q. How many samples?

A. They were bacteriological samples taken at LaSalle—

Q. Yes, how many, first?

A. Seven samples at La Salle.

Q. During what months?

A. We took two in October.

Q. Give the dates please.

A. October 28th and 29th and November 15, 16th, 17th, 18th and 21st.

Q. What was done with those samples?

A. They were sent to Dr. William Rush, at Peoria, for examination.

Q. How long did it take them to reach there?

A. I don't know, a very short time, I understood.

Q. You don't know though.

A. I don't know. The records are all in Dr. Rush's work but I don't know from memory.

Q. Well, the next in going on down the river, what is the next pond, basin or lake that you know of?

1398 A. I know that the water spreads out in quite a little lake above Peoria.

Q. Well, before you reach Peoria?

A. I do not. I know that there is a dam in there but personally I don't know.

Q. A dam in where?

A. I understood there was a dam at Henry.

Q. How far above Peoria is Henry?

A. I don't know that.

Q. Well, assuming that there is a pond or lake at Henry, would there be more sedimentation there?

A. Yes sir.

Q. In any stream of water where there are places that we speak of it is as a still water which is as compared with the general current of the stream, will there be sedimentation?

A. Yes sir, there will.

Q. Well, now when you reach Peoria you say that there is another lake?

A. Yes sir, the water spreads out over quite an area there.

Q. And the sewage of Peoria, is it discharged above or below this lake?

1399 A. Below it I understand.

Q. How large an area is occupied by the lake or pond at Peoria?

A. I don't know. Three or four miles, I believe, by about 1,000 yards or more wide when I saw it.

Q. Was that in high water or low water?

A. That was low water.

Q. Low water?

A. Low water in 1901.

Q. Well, how was the current there?

A. It was slow, very slow. That was in the 1901 period.

Q. Well, there would be considerable sedimentation there?

A. Yes, sir.

Q. Then passing below Peoria where is the next pond?

A. There are three dams across the river now below Peoria.

Q. Well, take the first one.

A. I think it is the Copperas Creek dam.

Q. That is right.

A. Now, here I am familiar with the river. I have been up and down it a number of times, in a launch, the Copperas Creek dam, the dam backs the water or the water is backed up a great many miles and it makes quite a stream, navigable for large boats. In the low water season of 1901, I was in it. We had a launch drawing three and a half feet of water and occasionally it would hit the bottom and the water was running slowly at that time and the current in the river was slow. The water was running over the dam in a good volume.

1400 Q. There would be considerable sedimentation there?

A. A great deal.

Q. Do you know where Beardstown gets their water supply?

A. I don't know.

Q. Where is the dam located with reference to the city of Beardstown?

A. Below.

Q. Below the city is it?

A. Below the city, yes sir. That is LaGrange, you are speaking of now?

Q. Yes.

A. LaGrange dam is below Beardstown.

Q. Well, the Copperas Creek dam is above, isn't?

A. Above LaGrange.

Q. How far above?

A. I don't know what the distance is between these dams fifty, sixty or seventy miles.

Q. Well, then the next dam is at LaGrange?

A. The next dam is at LaGrange, yes sir.

Q. Well, tell us how large that is?

A. Well, the water backs behind this dam for quite a number of miles back. The river at the stage I saw it several times was anywhere from five hundred yards to a mile wide and the water was deep enough to have the boats run smoothly along up to Beardstown where the water was shallow.

1401 Q. Well, there would be considerable sedimentation there, wouldn't there?

A. Yes sir, a great deal.

Q. Well, give us the next.

A. The next one is at Campsville, I should say some seventy-five miles below but I don't know that positively. Here the water again is dammed and backs up, the current is retarded and a great deal of sedimentation will go on here in this flowing water.

There are no other dams from here through to the mouth of the river?

Q. Well, now the amount of dilution, what would you say of the amount of dilution at Joliet where you strike the first basin?

A. The dilution with the Des Plaines river?

Q. That is what it would be, wouldn't it?

A. Yes. I don't know what the ordinary seasonal fall is. We have the figures of the engineers that at times the waters from the Des Plaines river would pass through a six inch pipe. At other times there are eight hundred thousand cubic feet per minute.

Q. Well, take the average.

A. I don't know what the average is but I have seen this river a number of times and at no time that I saw it, would
1402 it pass through a six inch pipe, and I saw it in the dry
season, the fall of 1901, October and November but if it was the extreme mean it would certainly be—I don't know how many cubic feet a minute—but that has been recorded by Mr. Harmon in his report which you have.

Q. I was trying to put it all in here together.

A. Do you want me to read it?

Q. First I will go back and ask you about the dilution at the Drainage Canal. That is stated however, in the Act requiring the amount of flow?

A. Yes sir.

Q. Did you get as many parts of water to one of sewage?

A. I don't remember now. Calculating upon a 3,000 cubic foot flow a minute and taking all of the sewage of the two million people that discharged into it, we said there would be a dilution of one to nine, but that if 4-5 of the sewage is now discharged into the canal, as it is now claimed, the dilution would be one to eleven.

Q. Do you know as a matter of fact, that a certain amount of sewage now is discharged into the canal, that was at that time, discharged into the Illinois and Michigan Canal at Bridgeport?

ATTORNEY GENERAL CROW: You mean into the Drainage Canal?

1403 ATTORNEY GENERAL HAMLIN: The Drainage Canal, yes.

A. I think you were wrong in that question.

Q. (Question repeated)?

A. Chicago Sewage?

Q. Yes.

A. I don't know that and I don't believe it.

Q. Well, that wouldn't hardly be an answer that you don't believe it. You don't know it?

A. No.

Q. Well, there is a dilution. Assuming, as I understand, that the entire population, the sewage of the entire population is carried in of 1 to 9?

A. Yes.

Q. But assuming that 3-4—of the course the proportions would change correspondingly?

A. Yes sir.

Q. And if it was only the same that had been discharged for several years, in the Illinois and Michigan Canal, why it would be whatever the proportion of its sewage discharge was to the number of cubic feet from the lake which was poured into the Canal?

A. Yes sir.

1404 Q. Would it?

A. The dilution would be.

Q. There would be a greater dilution?

A. Yes sir.

Q. Certainly. Now, when you get to Joliet, what is the dilution there, if you know?

A. I do not know.

Q. What is the dilution at LaSalle?

A. I do not know.

Q. What is the dilution at Peoria?

A. I do not know, I have not measured the streams myself and do not know the volume discharged in there and can not consequently arrive at any personal conclusion on the subject.

Q. Then you have not figured out or ascertained how much dilution there is of the water discharged into the Drainage Canal, or sewage discharged in the Drainage Canal from the time that it enters the Des Plaines river at Lockport until it reaches the Mississippi at Grafton?

A. I have not.

Q. I believe you stated that the two primary causes for disappearance and elimination from the water of the typhoid—

A. No.

Q. Well I will drop "elimination." I didn't think you would like that. Disappearance was sedimentation and
1405 dilution?

A. Yes sir.

Q. Have you ever been up any of these tributaries of the Illinois from Lockport to Grafton?

A. Yes sir, I have been up to Sangamon a short distance, the Macoupin Creek, Crooked Creek—or Macoupin River, I believe they call it.

MR. DRENNAN: Macoupin Creek it is.

A. Macoupin Creek, and all of these small streams below Peoria.

Q. Can you tell me how many tributaries the Illinois has from Illinois to Grafton?

A. I can name them over as I know them.

Q. Well, commencing up the river if you can.

A. We begin at the Des Plaines and the Drainage Canal, they mix at Lockport.

Q. Just the tributaries I want, Doctor.

A. Now, then, we have got the DuPage, the Kanakakee, the Fox and the Vermillion, the Big Vermillion, Macoupin Creek, the Sangamon, Crooked Creek and other small streams, in all I believe about twenty-one.

Q. Twenty-one tributaries it has?

A. Yes sir.

1406 Q. Do you know the relative size of them, and the discharge of water in a general way?

A. None other than from figures of the Civil Engineer, I say I have gone into some of these streams but I know nothing about volumes and I couldn't measure it.

Q. Well, there is a large volume of water discharged into the Illinois River from these tributaries, from Lockport to Grafton, isn't there?

A. Yes sir.

Q. Do you know how much area of country is drained by the Illinois River and its tributaries?

A. I have no other means of knowing than the figures of engineers.

Q. Well, do you now recollect?

A. No sir, I do not.

Q. Have you stated in your examination in chief about how much area is?

A. I have not.

Q. And you have no recollection on the subject?

A. I have not.

Q. Have you any recollection or means of knowledge that you can tell us about how much water is discharged at ordinary stages by the tributaries into the Illinois?

A. None other than the figures of Mr. Harmon, which I have injected into this report, and testified to.

1407 Q. You didn't find the typhoid bacillus in any of the waters, did you, that you examined?

A. Never found the typhoid bacillus but once in my life; that was in 1892.

Q. Well, that didn't answer the question.

A. I have never found it in any of these waters.

Q. You spoke about a certain creek or branch here in St. Louis at the time that the water works was at Bissell's Point?

A. Yes sir.

Q. What was the name of that creek?

A. Harlem Creek.

Q. Harlem Creek?

A. Harlem Creek.

Q. And that creek discharged its waters into the Mississippi River above the Intake at Bissell's Point?

A. Yes sir, 6,800 feet above.

Q. 1892 was the year that you had quite an epidemic of typhoid fever in St. Louis?

A. Yes sir.

Q. Did you trace the cause of that epidemic?

A. I thought I did.

1408 Q. Did you find it from the pollution of this creek?

A. Yes sir.

Q. How far from the river was the source of the disease, from the Mississippi River and the Intake?

A. Do you mean where was the particular case of typhoid on that drainage area?

Q. Yes, how far?

A. About three miles—three or four miles.

Q. And just tell how the stream became polluted with typhoid germs?

A. Well, all the drainage from the houses of this whole area was discharged through open sewers or private sewer connections, which discharged into this stream, Harlem Creek, the drainage area extends as far south as Easton Avenue and it includes the cemeteries to the west and quite a district east of that. All of the water discharged on that area passes down through this creek. At the particular time that this epidemic occurred, the water in the creek was low; the volume was small, but on account of the sewage pollution and the pollution from cow sheds and things of that kind, the water was very black and very fetid, running in a very shallow stream and any little freshet of rain that occurred, carried out this mass of dirty water into the Mississippi River and some of it into the Intake of the water works which was located below the mouth 1409 of this stream.

Q. And as a result of that, in your judgment, you had this epidemic of typhoid fever?

A. Yes sir. The water at that time was pumped into Bissell's Point reservoirs, there rested some 36 hours or more and then into the water supply of the city.

Q. Then you moved the Intake up to the Chain of Rocks?

A. Yes sir.

Q. To avoid this pollution of this stream?

A. I don't know whether that was the reason or whether it was for some other reason that the engineers of the waterworks moved it. I wasn't in their confidence.

Q. Well, the city grew in that direction also, didn't it, and the sewage was discharged above Bissell's Point?

A. Yes sir.

Q. You discharge all of your sewage into the Mississippi River here don't you?

A. Yes sir.

Q. And have for many years?

A. Well, ever since the city was large enough to have sewers. I don't know the exact date. It seems to me it was 1849 that the first sewers were built, but I am merely trusting to memory for that.

Q. What is the present population of St. Louis?

1410 A. Over 600,000. I don't know the exact figures now.

Q. Have you ever been up the Missouri River, to its source?

A. No sir.

Q. How far up the river have you been?

A. Well, I have been to various points on it and have been in the stream. I have been up the—the highest point that I have been on this stream is Fort Leavenworth, at the Fort.

Q. What is the first town above St. Louis on the Missouri River?

A. St. Charles.

Q. How far is that?

A. I don't know, about twenty miles I believe.

Q. Do you know whether it discharges its sewage into the Mississippi River?

A. I have been told it does by Dr. Morgner of that town.

Q. You have had considerable typhoid fever in St. Charles haven't you?

A. I believe they had once a typhoid epidemic there, following the discharge of dejecta from a typhoid fever patient in a hospital, which was carried into the water supply.

Q. Wasn't there a good deal of typhoid fever in 1902 in St. Charles?

1411 A. I don't remember the year, sir.

Q. Do you know?

A. I do not.

Q. Was there in 1901?

A. I do not know.

Q. You spoke of the typhoid fever that you had in St. Louis in 1902?

A. Yes sir.

Q. What portion of the city was the largest number of cases?

A. It was widely distributed througout the city. I had a map at the time and I still have it, I think, showing the location of each of those cases, and I think if I remember well, most of the cases were north of Lafayette Avenue, or north of the line running through the reservoir on Compton Heights—a line running east and west.

Q. Didn't you have considerable typhoid fever in what is known as the West End?

A. Oh, it was disseminated throughout—

Q. Well, I am asking you particualarly as to that part of the city.

ATTORNEY GENERAL CROW: What year, General?

THE WITNESS: 1892 he is speaking of, are you not?

ATTORNEY GENERAL HAMLIN: Yes.

1412 A. I don't know whether it was in the West End any more than in other parts of the city.

Q. There was in 1901?

A. I don't know that.

Q. Didn't you know, Dr. Ravold, or do you know that the large per cent of your typhoid cases in 1901, was in the West End, and that the examination showed that it resulted—that the cause was defective sewers in the West End?

A. I know it was not caused by defective sewers. Typhoid doesn't arise from defective sewers.

Q. Well, wasn't that the claim that was made?

A. I don't know who made it. If it was made, somebody made it without knowing anything about typhoid.

Q. Well, do you know that you did have considerable typhoid in the West End?

A. I don't know that. You are speaking of 1901?

Q. Yes or 1902.

A. 1902—Oh, I thought you were speaking of 1891 and 1892.

Q. Oh no, 1901 and 1902.

A. Oh, I have no evidence of 1901 and 1902 at all. I paid little attention to the location of the typhoid cases in 1901 and 1902.

Q. So you know nothing about it?

A. I know nothing about it, but I do know that question
1413 that I answered.

Q. Well, you don't know anything about what was the condition of the sewerage system in the West End, in 1901 and 1902, do you?

A. Well, I know the condition of that Harlem Creek area and I know the condition of Cabanne Place, and running south from that, but then I know something about the open sewers about there.

Q. Well are there open sewers in Cabanne Place?

A. Yes, there are open sewers about Cabanne Place, they are about there.

Q. I say, is there?

A. Yes sir.

Q. To what area do the open sewers extend, or what area is covered by the open sewers?

A. I really don't know, but quite a large area. It carries this material to the River Des Peres.

Q. Now, Dr. Ravold, a typhoid bacillus if in the water at the Chicago River, will have to travel down the Drainage Canal —would it not?

A. Yes sir.

Q. Pass through all these sedimentations lakes and ponds that have been mentioned, would it not?

1414 A. Yes sir.

Q. Be diluted with the waters from Lake Michigan and the tributaries of the Illinois?

A. Yes sir.

Q. And join the waters of the Mississippi at Grafton?

A. Yes sir.

Q. Then join the waters of the Missouri and pass by St. Louis?

A. Yes sir.

Q. That is the route that it would have to take?

A. Route of travel, yes sir.

Q. If there was a case of typhoid fever on any of the tributaries of the Illinois River which would pass in the dejecta would pass into the Illinois River through any of its tributaries, you couldn't tell—

A. It would not be labeled.

Q. How?

A. It would not be labeled.

Q. Wait a minute, I have not finished the question. You could not tell whether that bacillus originated—or any typhoid bacillus, assuming that one would come this distance, you couldn't tell whether it came from the sewage of Chicago or came from some tributary of the Illinois, could you?

1415 A. No sir, not even if I found it in the water.

Q. You couldn't tell?

A. No sir, they have—it would have no distinctive marks that would make a Springfield typhoid bacillus different from that of Chicago.

Q. No sir, it would not be red-headed nor ring-tailed?

A. No sir, nor bald.

Q. The effect upon a typhoid bacillus coming from the sewage of Chicago of dilution, sedimentation and the light, and the other causes that you have attributed for the disappearance of the typhoid bacillus, would render it less liable to inoculate any one with the disease of typhoid fever than a bacillus that would come a distance of five or ten or fifteen or twenty miles, assuming that they were both equally virulent at the time they were discharged into the stream?

A. In a patient of the same susceptibility?

Q. Yes?

A. The chances are that the bacillus traveling from Chicago to St. Louis would lose its virulency sooner than one that had traveled only a few miles.

Q. A majority of the reported cases of typhoid epidemic from water pollution shows the origin to be less than 20 miles, doesn't it?

A. A majority of them do go back, because it is easy to trace them back. 1416

Q. You spoke of having examined the report made of the typhoid epidemic in Massachusetts. Where was that?

A. Well, that was a report which Dr. Sedgwick made, or Professor Sedgwick, for Lowell, Lawrence and Newberryport. I said I had information simply from that report, and it is in that report that he makes the statement that the evidence seems to show that there is no stream long enough to purify itself from sewage, even put in at its source.

Q. I will ask you, Dr. Ravold, if it is not a fact as a result of that report, that the Legislature of Massachusetts passed a law providing that there should be no sewage discharged into the streams in that state less than twenty miles above the intake of water supplies?

A. I think a law of that kind did come into force, following that.

Q. Do you say as a bacteriologist that in your judgment that limitation is a reasonably safe one?

A. It is an absolutely absurd one, it is not based on bacteriological evidence at all.

Q. You would not regard it as such?

A. No sir.

Q. And on your judgment twenty miles would not be a safe limitation?

1417 A. For any of the Massachusetts streams?

Q. Or for any streams?

A. That would depend upon the volume of the stream. If you had a tremendous volume of water, and a small town, why the danger would be greatly minimized, but from a bacteriological standpoint it would be unsafe to do it.

Q. Do you think that that is the consensus of opinion of the leading bacteriologists of this country and Europe?

A. I think it is.

Q. Do you say in your opinion it is?

A. Yes from conversations I have had with them and I know lots of them in this country and some of the good ones in Europe.

Q. What per cent of accredited cases that are reported in the books show the source of typhoid fever from water pollution to be exceeding fifty miles?

A. Well, I cannot say that definitely, and it would be an extremely difficult thing to do on account of the complexity of modern life.

Q. I am asking about the cases reported, that have come within your knowledge or reading?

ATTORNEY GENERAL CROW: We, he has answered it.

A. I said it would be a very small percentage of reported typhoid epidemics.

1418 Q. That occurred beyond fifty miles?

A. Yes, fifty miles, yes sir.

Q. Now name one if you have one in mind.

A. I have one in mind.

Q. Where was that?

A. Dredging at St. Clair.

Q. How?

A. Dredging of the St. Clair River, and the typhoid fever epidemic following in Detroit; that has been reported by Dr. Williams.

Q. Dr., that was a case when the river was being dredged?

A. It is a case. You asked me for a typhoid fever epidemic there were typhoid fever cases up the river above that. Typhoid fever discharges went into the river. They dredged into the silt and sludge and slime at the mouth of the Wolf river. This sludge was stirred up sometime afterwards and carried across Lake St. Clair into the water supply.

Q. I understand that. You did'nt answer the question. I asked you if that didn't occur when the river was being dredged?

A. Yes sir.

Q. Now what was the distance?

A. I don't know what the distance from the original typhoid case was to the waterworks at Detroit, but I think

1419 it is more than fifty miles.

Q. Well, it is not 300 miles, is it?

MR. DRENNAN: Forty seven miles.

A. I don't know exactly from the place where it originated, for it went across the lake.

Q. Well it had a chance for sedimentation there and there was so much of the deposit that was being carried across the lake, that it carried with it some of the typhoid bacillus, didn't it?

A. That seems to be the contention.

Q. Well, do you know the distance?

A. I don't. I have not measured it.

Q. Well, what was the reported distance?

A. I have Mr. William's report. I understood it was something over sixty miles.

Q. Well, what Mr. Williams is that?

A. Mr. Grander Williams—or Mr. Gardiner Williams, who investigated it. He is at Ithica. He is a civil engineer at Cornell University I believe, who has written a report on it, and who investigated it. Do you care to have me look up the distance?

Q. Now, isn't that the most extreme case on record?

A. My memory serves me with no other case at the present time.

Q. Then wouldn't you say that 95 per cent of the reported
1420 cases of typhoid fever epidemics or a large increase of
typhoid fever from water pollution, has been shown to be less than 50 miles?

A. Simply because of the facilities -

Q. Well, no, answer the question.

A. Yes sir.

Q. That is it. That answers it. What is the population of St. Charles?

A. I do not know.

Q. How far is it from the mouth of the Missouri to Kansas City?

A. I don't know that.

Q. Do you know that the sewage of Kansas City is discharged into the Missouri River?

A. Yes, sir, after resting in so-called cess-poools for a time.

Q. You don't know how long?

A. No, I do not.

Q. Is the sewage of St. Joseph Missouri carried into the Misssouri River?

A. I have been told that it is; I don't know.

Q. Is the sewage of Leavenworth and the hospitals there
1421 at Leavenworth carried into the Missouri river?

A. Yes sir.

Q. Doctor, in your opinion as a bacteriologist, there is only one absolutely safe and sure way of eliminating the bacteria, the pathogenic bacteria, from river water, and that is by filtration?

A. Oh, no.

Q. Well, I am speaking of the system of sewage—

A. System of the purification of waters?

Q. Of the purification of waters?

A. Yes sir.

Q. How much filtration in addition to what you have here in St. Louis, would have to be installed in your waterworks system to make it a successful system of filtration?

ATTORNEY-GENERAL CROW: Now we object to that for the reason that the question as to whether or not the city of St. Louis ought to have a filtration plant, or how much it would cost, or how it ought to be built, has no relevancy to the issues as to whether or not Chicago has added pollution to the water supply of this city, or the waters in the Mississippi river in addition to what was there prior to the opening of the Drainage canal, thereby endangering the safety of the health, and the lives of the people in the State of Missouri.

1422 THE WITNESS: Do you want me to answer the question?

Q. (Last question read):

A. That is not known by anybody. Do you want me to go on?

Q. Yes.

A. A body of engineers and expert filter men have been at work on that problem, and they have made recommendations without having carried out an adequate series of experiments on the water to ascertain the facts connected with it, and nobody knows how to filter this water supply, or what it will cost.

Q. You mean to say that a system of filtration could not be installed here?

A. I do not mean to say that, but it is not known how best to filter this water and what it will cost.

Q. Don't you know how best to filter this water?

A. I do not.

Q. You do not?

A. No sir.

Q. I believe you said that with the present system that you have, that there is removed from the water from 90 to 98 per cent of the bacteria?

A. In the reservoir system there is some seventy per cent
1423 removed and to the consumer, at a definite period of 1901, we found as high, I believe as you speak of, 90 to 95 per cent to the consumer, of bacteria removed.

ATTORNEY-GENERAL CROW: In what year?

A. 1901, in the period of October and November, 1901.

Q. ATTORNEY-GENERAL HAMLIN: And the addition --would the addition of additional settling basins eliminate the balance of the bacteria?

ATTORNEY-GENERAL CROW: Now we object to that as wholly irrelevant in this case.

A. The elimination do you want?

ATTORNEY-GENERAL CROW: Wait a minute. As wholly irrelevant for the reason that the question as to whether or not more settling basins would assist St. Louis, is not any defense for the pollution of our waters of the Mississippi river by the city of Chicago or the Drainage Canal.

ATTORNEY-GENERAL HAMLIN: Well, I will withdraw that question.

ADJOURNED until 2:00 p. m., same day, Wednesday, March 11, 1903, at same place.

1424 Southern Hotel, St. Louis, Mo., 2 p. m., Wednesday, March 11, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND NICHOLAS RAVOLD,

Resumed the stand for further cross-examination by Attorney-General Hamlin, and testified as follows:

Q. Dr. Ravold, you made some examinations through the three periods, of the water of the Mississippi river above Grafton, did you not?

A. Yes sir.

Q. Now, have you been from that point up the Mississippi river?

A. I have traveled by boat as far as Dubuque.

Q. Can you name the principal towns from Grafton on the Mississippi river to Dubuque.

A. I cannot.

Q. Do you remember where Quincy is located, or about where?

A. Yes, sir, it is in Illinois, that is on the Illinois side.

Q. Keokuk, do you remember that place?

1425 Q. In Iowa?

A. Iowa, yes sir.

Q. And Rock Island?

A. Rock Island, yes.

Q. Burlington. That is in Iowa, isn't it, on the Mississippi?

A. Yes, sir.

Q. Davenport?

A. Yes, Davenport.

Q. Do you know whether or not these towns discharge their sewage into the Mississippi river?

A. I have seen the sewage discharging from some of those towns into the river. I think all of them do.

Q. Now, what do you say as to St. Paul and Minneapolis?

A. They also discharge their sewage into the Mississippi river.

Q. And do you know how many tributaries there are of the Mississippi river from Grafton to Minneapolis?

A. I do not.

Q. Well, do you know whether there are any?

A. Yes, sir, I know there are rivers discharging into the Mississippi, but I do not know the distance to them, the names of them, or the number. 1426

Q. But you know there are several?

A. Yes sir.

Q. Now, the Missouri river, what towns on the Missouri that you know of that discharge their sewage into the Missouri river?

A. I know Kansas City. I don't know of St. Joe by personal knowledge, but I know they discharge their sewage into the Missouri—I mean I know that St. Joe does. I know Kansas City does and I know that Leavenworth does.

Q. And the nearby towns?

A. St. Charles does also.

Q. How about Jefferson City?

A. Jefferson City, I believe, does also.

Q. How far is it from the mouth of the Missouri to Jefferson City by river?

A. I don't know.

Q. How far up is the Mississippi river navigable?

A. Well, in the period—in the dry weather period I traveled on it—I could travel as far as Dubuque only and had to travel from there north in a train.

Q. Is it navigated as far as St. Paul?

1427 A. At times it is, yes.

Q. How far is the Missouri river navigable?

A. Well, it is not navigable at all for anything but very flat boats, boats drawing very little water.

Q. To what extent is it navigated with flat boats?

A. Not very much.

Q. How far up?

A. I don't know how far they go now. The river is in very bad condition since the railroads have gotten after it.

Q. Now, then isn't it a fact from your understanding and knowledge, that the Mississippi river, the Missouri river and the Illinois river are used by the inhabitants of the various towns along those respective rivers, for the purpose of depositing their sewage in each of the rivers?

A. Yes sir.

Q. Now, isn't it also true that St. Louis, situated on the Mississippi river, below the mouth of the Illinois and the Missouri river, discharges its sewage into the same common drainage that the inhabitants of the other rivers do?

A. Yes sir.

Q. How many years has St. Louis, to your knowledge, been discharging its sewage into this common drainage canal?

1428 A. As I said before, I have looked over the statistics of the Sewer Commissioner here and if I am not mistaken, the first sewer, the mill creek sewer, was constructed in 1849. That is, the direct sewage discharge. That was the first sewer, that was the beginning of the large sewer system that we have now running through the town—Mill Creek sewer.

Q. What year was that?

A. I think that was in 1849, but I do not know that accurately.

Q. And it has been discharging its sewage continuously then from that time until this?

A. Yes sir.

Q. Now, what was the population of St. Louis in 1900?

A. I can not remember the figures; I do not know accurately from memory now.

Q. Well, have you some way—I want to ask you some questions on that, if you can have some means of—

ATTORNEY-GENERAL CROW: 575,000, something like 600,000.

ATTORNEY-GENERAL HAMLIN: 575,200?

A. A. Yes, the estimation has been made for easy reading at 600,000.

Q. Now, that is within the corporate limits, is it not?

1429 A. Yes, sir.

Q. Now what suburban population is there that discharges its sewage into the Mississippi?

A. Well, suburban population—you mean so as to come into that sewage system of the city?

Q. Well, I will ask you that first?

A. Well, I don't know that—what on the other side of that drainage area discharge their sewage into the river Des Peres and some of that sewage was carried through the Mill Creek part of it goes south through Carondolet, through the river Des-Peres.

Q. That discharges in the Mississippi?

A. That discharges in the Mississippi river, yes, sir.

Q. Well, if you know what suburban territory here discharges its sewage into the Mississippi river, you can tell us?

A. I do not know except the suburban along the river Des Peres drainage area, and that extends south and west of the city.

Q. You are speaking now of that portion of the population outside of the city limits?

A. Yes, sir.

Q. Could you give me approximately the amount of population outside of the city limits whose sewage is discharged into the Mississippi river?

1430 A. I can not.

Q. Well, now on the basis of a population of 575,000, can you tell me how much sewage is discharged daily by the inhabitants of the city of St. Louis into the Mississippi river?

A. The water consumption is about 130 gallons per inhabitant. 78,000,000 gallons.

Q. Every 24 hours?

A. Yes sir.

Q. And that calculation is based upon the same calculation that you made in regard to the city of Chicago?

A. That is the water consumption here of 130 gallons per head per day. I can make that for 150 gallons if you will agree to have it said that we pumped the same quantity of water to the individual.

Q. But you do not?

A. No, we do not.

Q. Well, then make it—

A. Make it 130 gallons, I think it is.

Q. Now what is the population of St. Charles?

A. I do not know.

Q. What is the population of Jefferson City?

1431 A. I do not know.

ATTORNEY GENERAL CROW: 9,700 for St. Charles.

Q. ATTORNEY GENERAL HAMLIN: Now, assuming that the population of Jefferson City is 9,700, how much sewage would there be?

A. And their water consumption what?

Q. Well, the usual average.

A. Say we allow them 100 gallons a day.

ATTORNEY GENERAL CROW: It doesn't run as large in small towns as it does in large cities.

THE WITNESS: No. Say they were using—pumping 100 gallons of water to each inhabitant and basing the present population upon 10,000, they would discharge 1,000,000 galons of sewage per day.

Q. Do you know the population of Kansas City?

A. It is about 200,000.

Q. Very well. On the basis of 200,000 what would be the discharge—

A. I do not know what the amount of water per inhabitant is, but we can take it the same as St. Louis, or 130 gallons, or make it 100 gallons. It is much easier figuring.

Q. Well, use anyting you want to.

1432 A. If it were 100 gallons per inhabitant, there would be 20,000,000 gallons of sewage a day.

Q. How well acquainted are you at Kansas City?

A. I have been there three times in my life and am not very well acquainted with it.

Q. Do you know anything about the location of its stock yard?

A. No, sir.

Q. Do you know whether or not the stock yards discharge their offal into the Missouri river?

A. I do not.

Q. Now, Doctor, I will ask you to state again, the cause of typhoid fever and how that disease may be communicated?

A. We have first air borne, carried in the air. The typhoid bacillus retains its vitality a long time in the earth and it is just possible that when the earth becoming dried and ground up as dust and blown into the air, the bacillus may be taken into the lungs of the individual, or rather into the respiratory passages and thus swallowed, and eventually into the stomach; and that was a remote possibility.

Then, we had air-borne and we can say insects under that, flies. Flies in the summer time, as I cited the instance at Chickamaugua, where this was claimed to have been the cause 1433 of the conveyance of the typhoid fever from the dejecta or the excrementatious matter that had collected in the latrines of the soldiers, not disinfected in any way. Flies settled upon this material, the feces stuck to their feet, they traveling from these latrines to the mess table, and crawled all over the food. The distance was short from the latrines to the table, and in that way it was claimed that some of those typhoid cases might have been conveyed. So, we have flies.

Now, food. Food such as lettuce sprinkled with typhoid water, celery and other green foods, oysters, raw, and milk that has in it—that has become infected with typhoid excreta either directly from the hands of milkers or by the addition of infected water to the milk.

Then the direct transmission by an individual nursing or handling a typhoid fever patient and without cleansing the hands carrying the bacillus directly into the mouth and thus conveying the disease—and I cited the case of a doctor working in my laboratory, named Beggs, working on a typhoid feces, who infected himself, through a lack of cleanliness. I think 1434 that is the number.

Q. Where does St. Louis get its milk supply?

A. It gets a great part of it from the rural districts of Illinois and Missouri.

Q. Do you know from your own knowledge what companies furnish this milk?

A. Well, I know that the St. Louis Dairy Company is one; the Union Dairy another one; the Bon Terre another one; the Graffman; the Keyes. I think that is about as far as I can remember.

Q. In your work as a sanatarian, have you ever visited these places?

A. Yes, sir.

Q. What do you know as to what they do in the way of sterilizing their cans?

A. In nearly all of these places they steam sterilize the cans before sending them away or they drive into them boiling hot water with streaming steam in it before sending the cans away from the city.

Q. Is there a company here known as the Union Dairy Company?

A. Yes, sir.

Q. Have they any system of sterilization?

1435 A. I really do not know that, I never visited that plant.

Q. Don't they handle a large quantity—

A. A large quantity of milk, yes sir; but just exactly what they do with the cans I do not know. I once requested entrance into that place but inasmuch as the superintendent was not present I was not admitted.

Q. Well, if the cans are not sterilized, as a sanitarian, do you regard that as likely to result in typhoid germs?

A. Well, I would say that it was a gross act of negligence, owing to the fact that there is a possibility of this typhoid bacillus being conveyed in that way.

Q. Do you know of any epidemics that have been caused from the milk supply?

A. Here?

Q. No, anywhere?

A. Oh, I know there are accounts in the literature of epidemics of that kind.

Q. Well, how often and how many and to what extent?

A. I have not the figures just now, but there are quite 1436 a number of them, quite a number of authentic cases recorded of milk producing local epidemics.

MR. DRENNAN: Of typhoid?

A. Of typhoid, yes sir.

Q. ATTORNEY GENERAL HAMLIN: Suppose that a well was inoculated with typhoid bacillus and that its water should be used in washing the milk bottles—

ATTORNEY GENERAL CROW: Diluting it you mean, don't you?

ATTORNEY GENERAL HAMLIN: No, I am not diluting now. I am on another branch of the case.

—and putting in the hot milk into these cans or bottles without sterilizing them, what would you say as to the propagation of typhoid bacillus?

A. There is a possibility of conveying them in that way into the milk.

Q. Have you known them to be conveyed in that way?

A. I have not personally.

Q. You do know in the books, I suppose?

A. I do know in the books where a man—not exactly, no, that is the milk bucket itself, or the can—undoubtedly that contained the milk was washed with this diseased water and not entirely drained and the typhoid bacilli had got into the milk.

Q. Have you the table which you gave as to the per cent 1437 of deaths to cases in St. Louis for the years 1897, 1898, 1899, 1900, 1901 and 1902?

A. It is in the building, sir. It is down in the General's room.

MR. DRENNAN: I have got an abstract of it. You may recognize it as correct.

A. Would you rather see the table?

MR. DRENNAN: You look and see if that is correct.

ATTORNEY GENERAL CROW: I will go down and get you the chart.

THE WITNESS: All right. These figures are correct, but he has gone to get the tables.

ATTORNEY GENERAL HAMLIN: I can drop this until General Crow comes back, and ask some questions on something else that is not perhaps so important.

MR. WOERNER: Just go ahead.

ATTORNEY GENERAL HAMLIN: You can cancel that question until Attorney General Crow comes back again.

Q. Now, Doctor, what is the relative volume of water forming the Mississippi river opposite the city of St. Louis, contributed by the Missouri and the Illinois and the Mississippi rivers above the mouth of the Illinois?

1438 A. I do not remember. I have some figures on that subject in my report, and I had better get that.

Q. Yes, you had better.

A. Yes, I had better get that report.

Missouri river during the 12 years 1879 to 1890 inclusive, has a minimum flow of 39,900 cubic ft. per second. These observations were recorded in the month of November, in November 1895 the lowest flow on record of this river was recorded as being 20,600 cubic ft. per second. These figures obtained through the courtesy of Mr. A. H. Blaisdell, of the Missouri River Commission, St. Louis. Now, that is the Missouri.

In 1880 the Mississippi river at Hannibal, the minimum about 100 miles above Grafton was a flow of 22,498 cubic ft. per second and a maximum of over 272,699. These observations were recorded on January 28 and April 29 respectively of that year.

Now, do you want to get this below Grafton?

Q. I want the Illinois river at Grafton?

A. Well, the Illinois River, I have no figures for that except what are in Mr. Harmon's book, Mr. Harmon's report.

Q. Did you state that, haven't you stated that?

1439 A. I stated the flow at Peoria at that time for ten years observation for low river stages, and it was 1221 ft.

ATTORNEY GENERAL CROW: Per second?

A. Yes, cubic ft. per second.

Q. ATTORNEY GENERAL HAMLIN: Well, did you get the volume of water at Grafton?

A. No, I did not.

Q. That is, after the waters of the—

A. Oh, below where the two had come together and are flowing in the Illinois River water and the Mississippi water?

Q. No, what I really wanted to get was this: the volume of water at Bellefontaine in the Missouri and of the Illinois river at Grafton and the Mississippi river above Grafton.

A. Well, the only observations that have been made near that point, the points you request on the Missouri river, are the figures I have just read of the Missouri River Commission and these figures are from the Mississippi river Commission. They have no flow records at Grafton nor at Bellefontaine— they have no measurements for that at all. They have no stations there in other words.

JUDGE SPRINGER: Well, was the Missouri River taken there?

A. I don't know where that was; that was above Bellefontaine somewhere on the river.

1440 ATTORNEY GENERAL HAMLIN: That was 39,000.

A. Yes, sir that was 39,000.

Q. Cubic ft. per second?

A. Yes sir.

If the square miles on the drainage area of the Missouri are wanted I have it here, from their report.

Q. Well, isn't it a fact that you know that the Illinois River only contributes about 1-10 of the volume of water that is contributed by the Mississippi above Grafton, and the Missouri at its mouth?

A. Well, we can easily get at that.

Q. I don't know whether you can or not if you take Hannibal as a basis.

A. Well, are there any very large rivers coming in below that?

Q. I don't know.

A. No, I think there are not.

MR. DRENNAN: There are a great many creeks and much drainage.

ATTORNEY GENERAL CROW: There isn't any difference much in the size of the river at Hannibal and at the junction of the Missouri and the Mississippi?

A. The nearest one, the West Fork River, enters about 15 miles above Grafton into the Mississippi about 40 miles
1441 above the mouth of the West Fork is the Salt River, which enters into the Mississippi.

There are one or two large rivers which join the Mississippi about 100 miles above Grafton.

Q. And that is below Hannibal?

A. I don't know whethere it is below Hannibal or not. Are you sure about that?

Q. I say I don't know.

Well, isn't it a fact, if you know, that the Illinois river only contributes about 1-10 of the volume of water that is contributed by the Mississippi above Grafton and the Missouri at its mouth?

A. In these low river stages this would seem to be the case because I find that just below Grafton in the Mississippi the minimum flow of 24,858 cubic ft. per second was noted on January 11th of this same year. So that would give the Illinois there 2360 cubic ft. per second. That would be about 1-10.

Q. Now, I will resume, or repeat the question I asked you a few moments ago?

You have given the number of cases of deaths from typhoid fever in St. Louis for the years 1897, 1898, 1899, 1900, 1901,
1442 1902, have you not?

A. Yes, sir.

Q. How many cases in 1897, and how many deaths?

A. In 1897, 433 cases and 125 deaths.

Q. Now what was the population of the city in 1897?

A. I do not know other than the figures that I have just seen on this piece of paper that Mr. Drennan gave me.

Q. Well, assuming these figures to be correct, you may state that the per cent—

MR. DRENNAN: Let him give the figures.

ATTORNEY GENERAL HAMLIN: You may state what the population was.

A. The population 533,921, calculated I suppose from the census 1900.

Q. Now, you may state what the per cent of deaths was to the population?

A. I would have to calculate that out. There is a percentage given here but these are the figures of somebody else, not mine.

Q. Well, now, suppose you make that calculation?

A. What do you want? You want deaths to cases, do you, in that particular case?

Q. Yes, deaths to 100,000 population.

A. Percentage of cases per 1000 you have got here.

1443 ATTORNEY GENERAL HAMLIN: Per 100,000 it means.

A. Well, General Hamlin, it will take me several hours to work this thing out.

Q. You may have that paper (handing witness paper). Now, if you will take that set of figures, I want to ask you a few questions based on that and you can figure it afterwards.

I will ask you if the percentage of deaths from typhoid fever for 1897, 1898, 1899, 1900, 1901, and 1902, based upon the cases for each of these years in St. Louis, is not for the year 1897, 28.21 per cent.

For 1898 22.3 per cent.
For 1899 13.6 per cent.
For 1900 13.85 per cent.
For 1901 17.38 per cent.
For 1902 19.99 per cent.

These are the figures here recorded by Mr. Randolph, are they not?

MR. DRENNAN: Yes. What is your answer?

A. They are not my figures. I would have to verify them. These are the figures here recorded by Mr. Randolph.

Q. ATTORNEY GENERAL HAMLIN: Would you verify them?

A. Yes, sir.

1444 Q. And place them in the record at this place?

A. Yes, I will verify them, yes sir. These are the percentages of deaths to cases.

Q. Recorded as to population?

A. No, oh no. It is simply the number of deaths to cases, which means nothing.

Q. What is this per cent of deaths and to what particular cases?

A. Yes.

Q. Based on the population?

A. Yes, sir.

Q. Now, I will ask you if the per cent of cases to population for 1897 is not .083 per cent?

For 1898 .0774 per cent.
For 1899 .17 per cent
For 1900 .21 per cent
For 1901 .184 per cent
For 1902 .179 per cent

These are the figures of Mr. Randolph?

MR. DRENNAN: Yes.

A. Yes, sir.

ATTORNEY GENERAL HAMLIN: And you will verify them and place them in the record?

1445 A. Yes, I will verify them.

Q. And I will ask you if the per cent of deaths to cases of typhoid fever in St. Louis for 1897, was not .023 per cent in 1897 and in 1898 .0172 per cent,

For 1899 .023 per cent
For 1900 .029 per cent
For 1901 .033 per cent
For 1902 .0357 per cent.

A. Those are the figures of Mr. Randolph, which I shall verify.

Q. Now, Doctor, just a few more question and I am through. Now, do you know what the area drained—do you know the extent of the area drained by the Missouri River?

A. I have some figures on that. The watershed of the Missouri River embraces 530,000 square miles.

Q. Now, the area drained by the Mississippi river above Grafton?

A. I can not give you that because I have been unable to obtain it even from the Commissioners themselves,—the Mississippi river Commission are unable to give me those figures. They promised them to me but I have them not yet.

Q. Well, do you know the area drained by the Illinois river?

A. I think I gave you that.

1446 Q. Not to me, did you?

A. Not to you, no sir, I beg your pardon. No, what I read in the other report was the area, square miles of the upper, middle and lower rivers of the Illinois river.

Q. Well, that added together would make all of it, wouldn't it?

A. Grand total 27,914.

Q. 27,914?

A. Yes, from the table bearing upon this subject taken from the Illinois and Gulf Water Ways as related to the Chicago drainage problem by L. E. Cooley, Civil Engineer.

Q. Well, now, do you know approximately what the drainage area of the Mississippi river is above Grafton?

A. I do not. I shall try to have that Mr. Hamlin.

Q. All right. The per cent of area of the Illinois and its tributaries is very small compared with the area drained by the Mississippi river above Grafton, and the Missouri, is it not?

A. The drainage area of the Illinois compared to the drainage of the Missouri, yes.

Q. Of the Missouri and the Mississippi added together?

A. Oh, yes.

1447 Q. Very small, isn't it?

A. Very small, yes, sir.

CROSS-EXAMINATION

By Mr. Drennan, on behalf of
the Sanitary District of Chicago.

MR. DRENNAN: I will not be able to be here to-morrow but there are a few questions I want to ask the witness and then I willl leave the further cross-examination to Judge Springer, because I do not want to conduct it on my part.

ATTORNEY GENERAL CROW: I have no objection. Go ahead and suit your own pleasure about that.

Q. Doctor, I understood you to say that the principal water borne pathogenic bacteria were typhoid, cholera, and dysentery.

A. Yes, sir.

Q. You found none of these in the Illinois river, as I understand it?

A. No, sir, I found none of them.

Q. I understood you to say that the pathogenic bacteria did not thrive well in sewage and that in sewage they displayed less vitality and their existence was ended quicker there than elsewhere. Is that correct?

A. Well, you mean now the sewage of the drainage canal, 1448 do you not?

A. The sewage from cities such as would be discharged in the city of Chicago in the sewerage system there, just the same as eleswhere?

A. I did not work upon the actual contents of the sewers. The only observations I carried out were upon the longevity of the pathogenic germs in the waters of the drainage canal and the Chicago river also.

Q. After it was diluted with lake water?

A. It was diluted with lake water, yes.

Q. But isn't it recognized as a scientific proposition that these pathogenic germs do not thrive in sewage?

A. No, it is not entirely that way. It depends upon the character of the sewage. Some observations by different men show that the typhoid bacilius has lived as high as five months in sewage, while others but a few days. So you see it depends upon the character of the sewage at the particular time.

Q. You made no investigations there as to the sewage there in Chicago?

A. None whatever.

Q. So you can not answer as to that?

1449 A. No, sir, personally I can not.

Q. You spoke of the septic tank system of handling sewage, doctor?

A. Yes, sir.

Q. And I understood you to say that that system was still in its experimental state?

A. Yes, sir.

Q. And isn't yet regarded as entirely practical?

A. For certain classes of sewage it does not seem to be.

Q. The septic tank system is still in its experimental stage, is that right?

A. Yes. It is very efficient in some localities and not at all so in some others.

MR. DRENNAN: That is all, I think, Dr.

CROSS-EXAMINATION

By Judge Springer in behalf of the Sanitary District of Chicago.

Q. Doctor, you are acquainted with the work known as "Micro-organisms in water" by Percy and G. C. Frankland?

A. Yes, sir.

Q. Is that an authority in bacteriology?

A. Yes, sir it is. What edition is that?

Q. This is the edition printed in 1894.

1450 A. In 1894? Yes, sir, that was an authority at this time.

Q. Since that time, I believe there have been discovered some pathogenic and non-pathogenic micro-organisms which were not referred to by Frankland?

A. Yes, sir.

Q. I have another work here entitled "Principles of Bacteriology by A. C. Abbot, M. D., Professor of Hygiene and Bacteriology in the University of Pennsylvania."

A. Yes, sir.

Q. The sixth edition published in 1902?

A. Yes, sir.

Q. Is that an authority also?

A. That is a very good work, sir.

Q. Well, taking the list of pathogenic micro-organisms from these two works down to the present time—

A. Yes.

Q. I find the following list as set forth in those two books: Koch's Comma Spirillum or Bacillus of Asiatic Cholera. That produces cholera.

A. Yes, sir. Discovered in 1884.

Q. That was the first one?

1451 A. Yes, sir.

Q. Second: Vibrio Berolinenses and Vibrio Proteus. These may produce cholera I believe?

A. No, I do not agree to that proposition.

Q. Well, that is what is stated in the text books.

A. It is Berolinenses and Vibrio Proteus.

Q. Yes.

A. They produce a disease resembling cholera but not the true cholera.

Q. Yes, they produce a disease resembling cholera?

A. Yes.

Q. And the third is the typhoid bacillus?

A. Yes, sir.

Q. We have had reference to that frequently?

A. Yes, sir.

Q. The fourth is Bacilli Coli Commni?

A. That is classed as pathogenic.

Q. It is classed as capable of exhibiting very different degrees of pathogenicity, according to its origin. Sometimes pathogenic and sometimes nonpathogenic?

A. Yes, sir.

Q. That is correct, is it?

1452 A. Yes, sir.

Q. You have classified it here, I believe, as a pathogenic germ?

A. Nonpathogenic germ, as flowing in a stream—we said river—. Under certain conditions I stated in any river it was regarded as nonpathogenic.

Q. It is generally regarded, though, as nonpathogenic?

A. By water bacteriologists, yes.

Q. The fifth that I have here is Bacterium Tholoeideum. This is found in water suspected of causing typhoid fever by Schardinger.

A. Yes, sir. What was the year?

Q. The year is not given.

A. It is in Frankland. That is before we had the typhoid reaction.

Q. The sixth is Bacterium Lactis Aerogenes?

A. Yes.

Q. This was found by Schardinger in water suspected of causing typhoid fever, according to the statement of Frankland?

The seventh is Bacillus Anthracis?

A. Yes, sir.

1453 Q. This produces the spleenic fever in cattle?

A. Yes, sir and malignant carbuncle in man.

Q. Eighth is Proteus Vulgaris?

A. Yes, sir generally found in sewage.

Q. Ninth is Proteus Mirabilis.

Tenth is Proteus Zenkari.

Eleventh is Bacillus Proteus Fluorescens.

A. Yes, sir.

Q. Pathogenic to some of the lower animals?

A. Yes, sir, said to be by Frankland.

Q. Twelfth, Tubercle Bacillus or Bacillus Tuberculosis?

A. Yes, sir.

Q. Thirteenth, Bacillus Tetanus, produces Lockjaw.

A. Yes, sir.

Q. Fourteenth, is Bacillus Pyocyaneus?

A. Yes, sir.

Q. Fifteenth, is Bacillus of Mous Septicaemia?

A. Yes sir.

Q. Bacillus Murisepticus, pathogenic to house mice.

A. Yes, sir.

Q. Sixteenth is Bacillus of rabbit Septicaema, Bacilius Croniculicidas.

A. Yes, sir.

1454 Q. Seventeenth, is Bacillus Brevis.

Eighteenth is Bacillus Capsulatus.

Nineteenth is Bacillus Hydrophilus Fuscus?

A. Yes, sir.

Q. Twentieth is Bacillus Cocous.

Twenty-first is Staphylococcus Pyogenes Aureus

Twenty-second Fusarium. Agualductuum.

Twenty-third Bacillus Saprogenes II

Twenty-fourth Dyphtheria Bacilli.

This was stated by Abbott and not by Frankland?

A. Yes, sir.

Q. Twenty-fifth, Bacillus Dysenteriae?

A. Yes.

Q. That is by Abbott?

A. Yes sir.

Q. Twenty-sixth Bacillus Influenzae?

Twenty-seventh is Bacillus Leprae?

A. Yes, sir, causes leprosy.

Q. Twenty-eight, is Bacillus Syphilidis, producing syphilis

A. That is Schardinger.

Q. No, it is recorded by Abbott.

A. Did he question it? That is questionable.

1455 Q. Twenty-ninth is what is known as what is known as the glanders Bacillus.

A. Yes, disease of horses and men.

Q. The Thirtieth is Bacillus of Malignant Oedema?

A. That is found in the soil.

Q. Found in the soil only?

A. Yes, sir.

Q. Thirty-first is the Bacillus of Bubonic Plague.

Thirty-second is Bacillus Smegmatis?

A. Yes, sir.

Q. That embraces the list so far as given in these two volumes. Did you find any of these in the waters of the Illinois River except the Bacilli Coli Communis?

A. Oh, yes, I found that Proteus Vulgaris, the Proteus Mirabilis, Proteus Zenkari and I think we once found Bacillus Pyocyaneus.

Q. Did you find those in the Missouri water also?

A. I don't remember whether I did or not. I can easily tell you. I found the Proteus Zenkari one time in the Missouri River water opposite Bellefontaine.

Q. Did you find any of the others there?

1456 A. No, sir, except the Bacillus Coli Communis.

Q. What kind of diseases do they produce?

A. They produce no disease in man, they are nonpathogenic to man.

Q. Are they regarded as injurious to drinking water?

A. They are related somewhat to sewage producing, when associated with others.

Q. Not of themselves?

A. No, not of themselves.

Q. So far as the Illinois river is concerned, above the mouth of the river, you found no germs that were disease bearing so far as man is concerned, except the Bacillus Coli Communis?

A. No, sir, and which, by the water bacteriologists, are not classed among the pathogenic bacteria.

Q. Then your conclusion, as to the dangerous quality of bacteria in the Illinois river, was not based upon the poison, the actual germs that produced disease there, but other germs which were kindred, or sometimes found with them?

A. Yes, sir.

Q. The same is true of the Mississippi river above the mouth of the Illinois river, is it?

A. Yes, sir.

1457 Q. And of the Missouri river above the mouth of that stream?

A. Yes, sir.

Q. You found then, substantially the same conditions existing in all these three rivers?

A. Yes, sir, only more of this sewage bacteria in the drainage canal and Illinois river than we found in these others.

Q. You mean more as to quantity?

A. Yes, we found them a greater number of times.

Q. But not a greater number as to quantity? You took more samples from the Illinois river than the others?

A. I think we took more samples from the Missouri river than from the drainage canal or from the water at any other station, we were always right up against the Missouri there and it was easy to get samples.

Q. Is there any means now known of obtaining absolute proof of the hygenic quality of water supply?

A. Well, bacterteriology will indicate the presence or absence of bacteria.

Q. Is that sufficient to determine the potability of the
1458 water supply itself?

A. Yes, sir, it was used by the German Government.

Q. It may be sufficient?

A. Yes, sir.

Q. Do not bacteriological examinations of water produce different results at different times when the conditions are slightly different?

A. I don't exactly get that question.

Q. The conditions under which samples of water are taken are so varied that you may find a very different result on one day, or a few days afterwards from what you found on the previous day?

A. That depends—you mean in the river?

Q. Yes.

A. That depends on the condition of the precipitation on the drainage area.

Q. Then all these samples that you have taken and have examined must be considered in the light of the stage of the river and rainfall at the time?

A. Yes, sir.

Q. And also the condition of life?

A. No, we found that practically meant nothing.

1459 Q. It would be very slight, if any?

A. It would be very slight, in the Drainage Canal, there was a variation there, too.

Q. In order to obtain a perfect, or approximately perfect knowledge of the bacteriological condition of running water, would it not be necessary to take samples every day in the year and under precisely similar conditions for those days in order to make your calculations reliable?

A. Yes, sir, that is what we did.

Q. Every day in the year?

A. Every day in 1900, from January 23rd to October—whatever date it was, the 11th I think.

Q. That was for 1901?

A. For 1900.

Q. You took the same for 1901?

A. For 1901 during the months of September, October and November.

Q. The samples that you took then, during the year 1901, covered only a small portion of that year?

A. Yes, sir, they covered the fall of that year, those months of that year, that is practically one-tenth of the year—no, two months—that would be practically one-sixth of it.

Q. What was, so far as you remember, the condition of
1460 the river, as far as rainfall was concerned, at that time, and the stage of water?

A. During that whole period of investigation from September 26th to October, when we stopped, or November, there was practically no rainfall in the Illinois river basin, and the same obtained on the Missouri and on the Mississippi river basins, there was very little, if any, rain during this whole period, it was a time of drouth, so that was taken during a period of drouth when all the rivers were depending on the springs that were discharging into them, and they remained practically level, as I showed in the charts.

Q. During the time of low water would not the effect of the Chicago sewage be more pronounced in the Illinois river than at flood time when the drainage from all other parts of the drainage area came into the river?

A. It has shown less after running a definite number of miles, there is less trace of it in the Illinois river than there is at higher periods.

Q. You mean by that that the water showed less pollution during the periods to which you refer?

1461 A. I say it showed fewer bacteria than were originally carried by the drainage canal after running to Peoria and then to Grafton than it did in the season either following a freshet or when the river was high but steady.

Q. Did the drainage from the farm region and from the pasturage of the country districts generally,—if that was coming into the stream, wouldn't it be more peculiarly a condition created by the ordinary flow of water from Lake Michigan and the Chicago Canal?

A. Yes, sir.

Q. So that would be a better time for determining the influence of the Chicago water on the Illinois water?

A. This particular time was an extraordinary time, the 1901 period was an extraordinary condition, there was very little water in the river other than that discharged into it by the Drainage Canal.

Q. That was a dry year?

A. Yes, sir, very dry.

Q. The water supply then was principally from the springs in the river and from the water from Lake Michigan and the Drainage Canal?

A. Yes, sir, during that period there was very little water running over the dam, Copperas Creek and La Grange
1462 and Campsville, I don't believe any more than what you were discharging was running over the dams, I heard the river men crying for more water all along the river.

Q. Isn't it true that water in streams is, by all recognized standards of potability, at one time and another, the subject of contamination?

A. Yes, sir.

Q. Is there such a thing as absolutely pure water found in nature?

A. Bacteriologically, absolutely pure water there is none except that of boiling springs.

Q. Does not all water, from whatever sources, save from the hot boiling springs, contain more or less bacteria?

A. Yes, sir, from very few numbers, from three or four per cubic centimeter, up to large numbers.

Q. Then the presence of bacteria in water is not of itself an evidence of fecal pollution?

A. No, sir, simply evidence of food supply for bacteria to grow upon.

Q. Have bacteria been found in fresh fallen snow?

A. Yes, sir.

1463 Q. In hail?

A. Yes, sir.

Q. In rain water?

A. Yes, I have found it in all of them.

Q. Have you made any examination of bacteria found in running water in other streams than in the Illinois, Missouri and Mississippi?

A. Yes, sir, I have examined the Meremac river here.

Q. In St. Louis?

A. Yes, sir.

Q. That is a kind of mountain stream, isn't it?

A. It has its source in the Ozarks, I have examined the streams at St. James, Mo., and I have examined the great St. James Spring, which is so much talked of as a source of water supply for St. Louis, and I have examined the waters of Hot Springs, Ark.

Q. Do you find bacteria in all these waters?

A. Yes, sir, except the boiling waters of Hot Springs, Ark.

Q. Then there is no such thing as running water, such as is found in rivers and streams of any country, being free from bacteria?

A. No, sir.

1464 Q. Have you examined the bacterial conditions of water in other rivers than those you have mentioned?

A. Personally I have not, but I have watched the work being done such as that at Hamburg and Berlin, in hygenic institutions of these cities, and in Paris, and in some of the water works of London, at Glasgow, Scotland, and some of the work at Munich, Germany.

Q. In the ordinary conditions of these streams did you find a large number of bacteria in them?

A. You mean without a rainfall on the drainage area?

Q. Yes, sir.

A. No, sir, without, a rainfall, that is with the river stationary, there were large numbers of bacteria as a rule in such streams as the Meremac.

Q. But in navigable rivers?

A. Yes, such as the Elbe, that is a dirty stream, it has large numbers of bacteria, so has the Spree at Munich, and the Danube and the Thames at London.

Q. How do the number of bacteria found in those streams compare with the number that you found in the Mississippi river, the Missouri river, the Illinois river, where you took samples and examined them?

1465 A. Well, depending on the flood volume now there is a difference here in the methods in our efforts to obtain results as indicating the growth of bacteria, some regard gelatine the best media for bacteria to grow upon, but we get higher results as a rule than other observers record when they use gelatine, when other media such as Bahrstöffe Hyden which is a proteid compound enormously large numbers are found, but the medium is erratic.

Q. Enormously large as compared with the rivers in this country?

A. I say in this country they were enormously large when we used this nutritive medium but the results were erratic, they had not the uniformity of the gelatine media, so that gelatine was used under the conditions we speak of, and in recording results these conditions must be taken into consideration when comparing them with other bacteriologists with other streams of other countries.

Q. Then, isn't it true that the conditions bacteriologically considered, of the Illinois, the Mississippi and Missouri rivers at the places where you have taken samples of water, are very similar to the conditions found in rivers of similar size in this country and in Europe?

1466 A. Yes, sir.

Q. Isn't it true of all the periods to which you have refered as the first, second and third period of our investigations here?

A. Yes, sir.

Q. So that you are not surprised to find then in all these waters a large number of bacteria at different times?

A. No, sir.

Q. You would have been very greatly surprised if you had not found any?

A. If I had not found any at Lockport I don't know what would have happened to me, but I would have been terribly disappointed.

Q. Are the rivers generally in this country and in Europe in such a condition as to render them unfit for water supply for cities without some kind of sedimentation or filtration?

A. Yes, sir.

Q. That is, they are unfit?

A. Yes, sir, as a rule.

Q. That applies to all the rivers to which you have referred in your examination here?

1467 A. Yes, sir.

Q. As a bacteriologist, then, you would not recommend supplying cities with water taken from the running streams of this country without some system of sedimentation or filtration being adopted for the purpose of removing bacteria?

A. No, sir, I would not.

Q. That opinion applies to all the rivers of which you have spoken in this examination, does it not?

A. Yes, sir, because all these rivers have sewage discharged into them.

Q. Is it possible from your observation of conditions, that exist in this country and in Europe where their populations are becoming dense, to prevent sewage from getting into running streams?

A. Yes, sir, they do that very effectually at Berlin with their irrigation farms; in Glasgow, Scotland, I drank the sewage that had been chemically treated before it was discharged into the river Clyde; at Paris the same thing is done after it is treated, and there are well known methods of purifying sewage before discharging it into a stream.

Q. You refer to the sewage refuse?

A. Yes, sir.

1468 Q. I would ask you generally, in regard to sewage such as comes ordinarily from farms and the rural population?

A. About one-sixth of that is discharged into streams, and before it gets in it is generally pretty old.

Q. You spoke about the contamination being greater at flood time in rivers?

A. Yes, sir.

Q. What was the cause of that?

A. The contamination—you mean the number of bacteria per cubic centimeter are larger in a running stream at that time?

A. Yes, sir.

Q. That means this, that the soil, all soil, surface soil, contains millions of bacteria upon it growing upon nutritive matter that there exists, vegetable matter, as a rule those bacteria are washed into the running streams by the rainfall, so the bacteria found at these particular times are soil bacteria in preponderance, as a rule.

Q. They can not be kept from the streams?

A. No, sir.

Q. Isn't that contamination sufficient to condemn all our running water for potable purposes?

A. No, sir.

1469 Q. Wouldn't it at flood time be unfit?

A. No, sir.

Q. Why not?

A. Because they are nonpathogenic germs.

Q. Couldn't pathogenic germs be there as well as elsewhere?

A. But not in such numbers.

Q. If there was a diphtheria epidemic at any of the towns in the vicinity of this city that had no other sewage than these rivers, and the flood time came and washed all these diphtheria germs into the river, wouldn't that contaminate the stream?

A. You said diphtheria, do you mean diphtheria?

Q. No, I mean typhoid fever, excuse me.

A. Yes, if this was thrown out on the soil, or from privy vaults it would sweep out into the stream in the mass of volume of water that washed all that surface and be carried along the Lord knows how far.

Q. It would be carried into the stream?

A. Yes, sir.

Q. And would be dangerous?

A. Yes, sir.

Q. Are not many well known cases of typhoid epidemic produced by the spring floods washing the dejecta into the
1470 river which has been deposited during the winter season and not from the sewage of cities?

A. There are not many cases of that kind. We had a remarkable case which I mentioned this morning at Detroit in which a mass of filth and sewage which had collected at the mouth of the Wolf river was cleared away and carried across Lake St. Clair into the water supply of Detroit, causing typhoid fever, but the other case I spoke of was at Plymouth, Pa., where the water washed down the sewage from one patient and which affected the whole water supply.

Q. That danger would exist at all times under like circumstances?

A. Yes, sir, if a mass of feces should be thrown out on the sides of a reservoir, that at any time would be a dangerous thing.

Q. May not that occur at any time in all the rural districts contiguous to the rivers?

A. Yes, sir, but it is such a very minute thing where there is a vast volume of water, here at Plymouth was a reservoir direct in contact.

Q. It only lessens it as to degree?

1471 A. Moves the bacteria further apart, that is all, they are still alive.

Q. And they are still dangerous?

A. Yes, sir.

Q. As a chain is not stronger than its weakest link the water supply is no better than its weakest place.

A. None whatever.

Q. Then you ought to have a water supply that would be good at all seasons, at all times, and under all conditions?

A. Yes, sir.

Q. Can you have that if you take your water supply from the rivers without filtration?

A. There is danger from a river that may contain, or does contain the sewage of any community, it is unsafe to drink and no matter how far above the sewage is thrown into the river it is unsafe to drink that water unless it receives some treatment for the purpose of removing bacteria.

Q. And it would be unsafe even if you eliminate the city sewage?

A. The danger would be very greatly minimized.

Q. Greatly reduced, of course, by the amount of sewage coming into the stream?

A. Yes, sir.

1472 Q. But still the danger would be there?

A. Yes, sir.

Q. You spoke of having visited Lausen, Switzerland?

A. Yes, sir.

Q. The cause of that epidemic, I understood you to say was the pollution of—

A. The pollution of a brook.

Q. That was in the immediate vicinity of the place where the water supply was obtained?

A. Well, as I told you at the time, Lausen, is in one valley and the brook is on the other side, the brook is on a mountain on the other side of this valley in which the valley of Lausen lies, and it was the water from that brook which discharging through an opening in the mountains and was percolated down through the mountain a mile or so.

ATTORNEY GENERAL CROW: By a conduit?

A. No, percolation down through the mountain did it.

MR. DRENNAN: Down a wall?

A. No, not down a wall, there is a large reservoir where the water is stored before being distributed to the town.

JUDGE SPRINGER: There was only a mile and a half in distance from the place of contamination to the place of
1473 distribution?

A. Yes, sir, but there was a whole mountain between it.

Q. When they ascertained that they put a deposit of salt in it?

A. 5,000 pounds.

Q. To see if it would come through on the other side?

A. Yes, sir, to see if soluble substances came through.

Q. So that there was an underground passage?

A. There was a percolation through rocks besides the investigators put flour and material of that kind in above to see whether the passage through the mountain was a tunnel or a large opening and they found was not, because particles of flour were too large to pass through the filter, but the typhoid bacteria were small enough to be carried through.

Q. And did go through, the places of contamination being only a mile or two from the place of distribution?

A. Yes, sir.

Q. I believe the same conditions as those existed at Caterham, England, to which you referred?

A. Yes, sir.

Q. The contamination was direct to the water supply, right in the well itself?

1474 A. Yes, sir.

Q. In the village?

A. Yes, sir.

Q. And Plymouth. Pa., you spoke of that also?

A. Yes, sir.

Q. And there the contamination was direct into the water supply?

A. Yes, sir.

Q. From the immediate locality?

A. Yes, sir.

Q. Have you examined into the epidemics that occurred at Zurich, in Switzerland?

A. No, sir, I have not, I was there but I did not look into the question.

Q. You know about it?

A. Yes sir.

Q. It came from the lake at which the city of Zurich is located?

A. Yes, sir.

Q. In the immediate vicinity?

A. Yes, sir.

Q. And that was supposed to be sewage contamination?

1475 A. Yes, sir, I did not stay long enough in Zurich to examine that, I intended to, but I stayed there only a few hours.

Q. Have you been advised as to an epidemic at a village called Springwater, New York?

A. I have read of it in the literature, I know nothing about it.

Q. In that case the cause of the pollution was in the immediate vicinity of the village?

A. So I undestand it, yes, sir.

Q. Do you remember whether or not there was a typhoid epidemic at Lowell, Mass., in the years 1890 and 1891?

A. Yes, sir, I read of it in Prof. Sedgwick's report on Lowell, Lawrence and Newburyport.

Q. From what source does Lowell obtain its water supply?

A. From the Merrimac river.

Q. And the pollution was from the waters of the Merrimac?

A. Yes, sir, from Stonybrook.

Q. Close to the city?

A. Stonybrook in which the water was carried to the intake, Stonybrook is above the intake.

Q. In the vicinity of the city?

A. Yes, sir, and that sewage was carried down to Lawrence and there caused a typhoid epidemic and then from there
1476 down to New Buryport down to the mouth of the river

Q. Have you had your attention called to Sault Ste. Marie in Michigan?

A. I saw an account of it in Mr. Hill's book, I have been at Sault Ste. Marie, but I did not investigate the typhoid fever epidemic.

Q. That occurred in the immediate vicinity, I believe, of the village?

A. Yes sir.

Q. Have you investigated the typhoid epidemic that occurred at Elmira, New York, in 1896?

A. No sir, none other than to read it in Hill's book.

Q. That you regard as a reliable statement of it?

A. Yes sir.

Q. In this statement of Mr. Hill's he says that the contamination came from the Chemung river and there were some places above, the highest above being fifty miles and the nearest sixteen miles, and that it must have come from some of these localities?

A. Yes sir.

Q. There was also an epidemic in Paris, France, in 1895, you have seen accounts of that?

A. Yes sir.

1477 Q. It affected the soldiers in the French army?

A. Yes sir.

Q. That pollution occurred in the vicinity of a camp of soldiers, I believe?

A. So I see it recorded, yes sir.

Q. Have you investigated the typhoid epidemic in San Francisco, California, recently?

A. No sir, I have not.

ATTORNEY-GENERAL CROW: How recently did that happen?

A. That is Hill's book in 1896, I believe.

ATTORNEY-GENERAL CROW: I thought he referred to something later than that.

JUDGE SPRINGER: No.

Q. That was in 1895?

A. Yes sir.

Q. Do you know how that occurred?

A. No sir, other than what is in the literature there, I never was in San Francisco.

Q. That occurred from a defect in the water pipe, I believe, in the vicinity of the city, there was a typhoid epidemic in Denver, Colorado, in 1896 also?

A. Yes sir.

1478 Q. Do you know how that occurred?

A. I do not.

Q. The books stated that it was some contamination in the river Platte just above the city?

A. That caused them to go high in the mountains to get a pure water supply.

Q. There was also an epidemic in Middletown, Connecticut in 1894, did you investigate that?

A. I did not.

Q. It is stated in the books that that occurred from a stream near by Middletown?

A. Yes sir.

Q. In Stanford, Connecticut, there was a similar epidemic about the same year, 1895?

A. Yes sir.

Q. It is stated in Mr. Hill's book, which I presume is reliable, that this Stanford epidemic was caused by the use of milk?

A. There are quite a number of milk epidemics recorded in literature, and all collected.

ATTORNEY-GENERAL CROW: You mean as an original source?

A. No sir, he don't mean that the cows had typhoid fever, 1479 but the milk had become contaminated with typhoid fever germs probably from a water supply.

JUDGE SPRINGER: There was also an epidemic at Elizabeth, New Jersey, and Evansville, Indiana, about the same time, although the time is not given here. I see from these recorded instances, which are the most classic, if I may use that word, in this connection, as to typhoid epidemics in this country and Europe, that all of them were caused by conditions which existed in the immediate vicinity of the place where the epidemic occurred, is that true?

A. Yes sir.

Q. The only exception to that is that of Elmira where the longest distance was fifty miles and the nearest was sixteen miles?

A. And New Buryport is recorded there also, Lowell, Lawrence and New Buryport at the mouth of the Merrimac river, and Lawrence is accused of being the source of that epidemic.

Q. Have you any information from your own investigations, or from the books, of a typhoid epidemic being caused, the cause having been ascertained definitely, by a pollution which occurred at a remote place from where the epidemic occurred, say more than fifty miles?

1480 A. Well, we had that one at Detroit caused by dredging of the St. Clair river, the typhoid bacilli came from Port Huron, which, I believe is 67 miles away, and they were carried across quite a large lake, Lake St. Clair, and into the water supply.

Q. That was a navigable stream, wasn't it?

A. Yes sir.

Q. Where vessels are plying all the time?

A. Yes sir.

Q. And there were dredging operations which were going on and which would disturb the waters, and which caused the flow to be carried more rapidly?

A. I don't know that the dredging operations would make the water flow any faster in the lake than it did before?

Q. The movements of a vessel in that direction would tend to carry some of it with it?

A. Yes sir, make some current.

Q. That was how many miles?

A. Sixty-seven miles to Port Huron, the source of the epidemic.

Q. Isn't that the only authenticated case on record where the place of pollution and the place of infection were as far apart as 67 miles?

1481 A. Yes sir, where it was so nicely traced, because the difficulties involved become enormous when we go further than that, because we have to cut out all possible sources of extraneous contamination, and the higher we go up the stream the more chances there are for contamination along the banks which we may not discover, so in trying to record a case of that kind it is extremely difficult to get all the facts. Modern life is so complex it is difficult to trace the sources the further we go up a stream.

Q. So that bacteriologists, in ascertaining the cause of typhoid epidemics, have not, up to this time, definitely located the cause of the infection at a greater distance than between Detroit and Port Huron?

A. Yes sir, simply because, as I said this morning, it is impossible even if typhoid bacilli were found at the place of entrance of sewage and then typhoid bacilli found in the water below it, could not be proven that they came from this particular place, because the bacillus is not labeled, has no sign or mark on it by which it could be distinguished from a typhoid germ, coming from any other source.

Q. Then there is no ascertained case of where the infection was brought further, than the case that you have just mentioned? 1482

A. I know of none.

CROSS-EXAMINATION, By Mr. Drennan.

Q. Mr. Randolph wants me to ask you one question; you spoke in your examination here of seeing, or some one informed you that they had seen a large number of dead fish going over Bear Trap dam?

A. Yes sir.

Q. Did you see that yourself?

A. No sir, I said that Mr. Miller of our office went there and saw it.

Q. Has he testified?

A. He has not, but he will.

Q. Do you remember the date of that?

A. Yes sir, it was in November.

Q. Give us the date, will you, about the time of day and who was present?

A. Early in November of 1900, five hundred dead fish were observed to pass over Bear Trap Dam in the space of 10 minutes, the range of actual vision being twenty feet.

Q. When was that, 1902?

1483 A. No sir, 1900.

At this point the further taking of testimony adjourned until 10 a. m., March 12, 1903.

1484 Southern Hotel, St. Louis, Missouri. 10:00 a. m., Thursday, March 12, 1903. Continuation pursuant to adjournment.

Present, the Commissioner, and same counsel representing the respective parties, and also Hon. James Todd, representing the Sanitary District of Chicago.

JUDGE SPRINGER: I want the stenographers to note the presence of the Honorable James Todd, General Counsel of the Sanitary District of Chicago.

DR. AMAND NICHOLAS RAVOLD, resumed the stand for further cross-examination, by Judge Springer, and testified as follows:

Q. Dr. Ravold, on Monday last you stated that you caused certain preparations of the bacillus prodigiosus to be deposited in the Sanitary Canal?

A. Yes, sir.

Q. And also in the Mississippi River above Alton?

A. The Mississippi River, just below the mouth of the Illinois.

1485 Q. Will you state the time at which you made the deposit in the Mississippi River below the mouth of the Illinois River.

A. Yes, sir. On August 31st, 1900, forty gallons of broth culture of the bacillus prodigiosus containing over one thousand million bacteria to the cubic centimeter, were emptied into the Mississippi River below the mouth of the Illinois River just below it.

Q. And the date was?

A. Now, that was August 31st. That was the first time.

Q. Any other deposits at that time?

A. On September 20th, this experiment was repeated, and a barrel containing 40 gallons of prodigiosus broth was emptied at the same point—no, you don't care anything about that; just the two dates.

Q. Well, I want to know all the deposits that were made in the Mississippi River at that time?

A. We have got, August 31st, 1900 and September 20, 1900.

Q. Does that constitute all that were deposited at that place?

A. In that period?

Q. In that period.

A. Yes sir.

Q. Did you make any deposits at this place at subsequent periods to that?

1486 A. No sir.

Q. Nor previous periods?

A. No sir.

Q. Then that comprises all that you did at this place?

A. At this place.

Q. In 1900?

A. In 1900, yes sir.

Q. Now state what investigations you made, if any, to ascertain the presence of the bacteria at points lower down the river?

A. Following this?

Q. Following those deposits?

A. We had samples of water collected at Alton, at Hartford, at the Illinois shore, Chain of Rocks, the Intake Tower of the Water Works, and on the Missouri Shore.

Q. When were those taken?

A. Immediately after depositing the material in the river.

Q. What do you mean by immediately?

A. The material was put into the river from a boat from the harbor boat, and as the boat descended the river, samples were taken,—collected as the boat—

Q. Floated down?

1487 A. Floated down. Not in a direct line, of where this material was deposited, but out in the channel. Samples were continuously taken there every two hours during the day, but not at night. We had no man there at night. Samples were taken though, every two hours during the day. On September 3rd, four days later, this organism was found in a sample of water collected in the channel of the river at Alton, not on the Alton side, but at another place.

In the September 20th experiment, on September 25th this organism was found in a sample of water collected near the Illinois shore, Chain of Rocks.

On October 18th, this bacterium was found in a sample of water collected from the laboratory tap in the old City Hall.

On October 24th, in a sample collected near the Illinois shore, Chain of Rocks,—the laboratory tap samples were taken every hour during the day—

Q. They were found in all of those samples?

A. It was found in the samples that I have recorded, September 23rd, Illinois shore, Chain of Rocks.

October 18th, in the laboratory tap.

October 24th in a sample collected on the Illinois shore, 1488 Chain of Rocks.

Q. Now how long a period elapsed from the time the first deposit was made at this point to the last examination of the samples which was made in that period?

A. Well, samples were continuously collected.

Q. I mean when was the last one in which you found the presence of this bacterium?

A. The first deposit was made on August 31st, 1900, as you see?

Q. Yes.

A. And it was found only once following that deposition. Then on September 20th, that is 20 days later, another barrel was sown in the river and on September 23rd, that is three days later, the bacillus was found in a sample taken at the Illinois shore Chain of Rocks, and on October 18th, in the laboratory tap.

Q. That was how many days later about?

A. That would be September 20th to 30th, ten days, to October 18th. That is 28 days.

Then it was found again on October 24th, in a sample collected near the Illinois shore, Chain of Rocks; that would be a month and four days—that would be 34 days.

Q. Was any further effort made by you to determine 1489 the presence of these bacteria in the waters in and about the Intake during the year 1900?

A. Yes sir. In all of the work in 1899, we searched the waters for distinctive forms of bacteria, beginning in August.

In 1900, from January 23rd to December, we searched these waters for distinctive forms, especially searching for the prodigiosus and we collected 6,000 samples at least, and found it only in the above mentioned samples after depositing the microorganisms in the river.

Then in the third period, over 10,000 samples of the water of Lake Michigan, Drainage Canal, Illinois River, Mississippi River, Intake Tower at Chain of Rocks, Reservoir and tap were studied and it was never found except when put in the river.

Q. The third period that you speak of, that was in 1901?

A. 1901, so you see we have examined thousands of samples of water and never found it except when put into the water of Lake Michigan, the Canal or the Illinois river.

Q. The question I asked was for the purpose of directing your attention to the latest examination which you made which revealed the presence of this bacterium after the deposits in the river above Alton?

A. October 24th.

Q. October 24th?

1490 A. Yes sir.

Now when was it that you made a deposit of this bacterium in the Drainage Canal near Lockport—was it?

A. During the third period, 107 barrels of prodigiosus broth—

Q. Will you state the date of that?

A. Yes sir. There were emptied into the Drainage Canal, 107 barrels of prodigiosus broth, containing more than one thousand million bacteria per cubic centimeter, and they were emptied in the Drainage Canal on the evening of November 6th, by Mr. Ravold—

Q. What year?

A. 1901. At Lamont, a small town on the Chicago Drainage Canal about eight miles east of the controlling works at Lockport.

A. You mean northeast, towards Chicago.

A. I don't know whether the canal runs directly east or northeast.

Q. That was in the Drainage Canal?

A. Yes, in the Drainage Canal at Lockport.

Q. How many barrels did you say?

A. One hundred and seven.

Q. And how many bacteria were deposited?

1491 A. One thousand million to the cubic centimeter.

Q. It is possible that some persons may read this record and would not have an idea of the size of a cubic centimeter, and I would like the stenographers to note the size of this so they can reproduce it.

Look at that thing doctor, and see if it is about the size of a cubic centimeter (Handing witness a small cube).

A. Yes sir, that is about the size.

JUDGE SPRINGER: This was made by Mr. Randolph, Chief Engineer of the Sanitary District of Chicago. Just put one side of it in the record?

(One side of said cube is about the following size:)

ATTORNEY GENERAL CROW: Let the record show that you have a cube.

JUDGE SPRINGER: Yes, that means a cube.

ATTORNEY GENERAL CROW: I would rather you would put the whole thing in. I don't understand how you can put one side of it in.

THE WITNESS: It is a cube with a side so large (indicating).

ATTORNEY GENERAL CROW: I think you had better deposit it with the Commissioner.

1492 Q. JUDGE SPRINGER: Now you think it is possible then for as many as a thousand millions of distinct organisms to be embraced or comprised into as small a compass as a cubic centimeter?

A. Yes, and a good many more.

Q. And still not displace any of the water?

A. Of course they displace water. They have got a presence, and a form and all that sort of thing. They are particulate particles.

Q. Can you give the dimensions as ascertained by experts of the size of the bacillus prodigiosus?

A. Yes, they vary in size from young to old. In some about one-tenth of a micro-millimeter, to two micro-millimeters, in length, and five-tenths of a micro-millimeter in width, or putting that in other figures, a micro millimeter is equal to 1-25,000 of an inch, so that the length of this organism would be from 1-50,000, to 1-12,000 of an inch in length, and about 1-50,000 of an inch in diameter.

Q. Did you make any calculation for the purpose of ascertaining the probable number of the bacteria known as prodigiosus, that would be contained in one of these barrels, that would be deposited in the water there?

A. Yes sir, that has been calculated.

1493 Q. Have you made that calculation?

A. Yes sir, I have, but I haven't the figures here.

Q. It would be rather past comprehension, wouldn't it?

A. It goes into the quadrillions.

Q. Now what were the difficulties that confronted you or your assistants in making the deposit of these bacteria in the waters of the Drainage Canal at that time?

A. The canal police.

Q. Did you see any of these policemen?

A. Oh, yes.

Q. What were they doing?

A. Patrolling the canal we understood.

Q. How many were there, did you see?

A. I saw one only, but the man who threw the material in the canal saw several of them at a little hotel in Lamont.

Q. Did those gentlemen make any objections to the placing of the contents of these barrels into the canal?

A. They were never taken into the confidence of the man who deposited the material into the canal.

Q. Therefore they didn't know what was going on?

A. No sir.

Q. This was in the latter part of November, 1901, was it?

1494 A. Yes sir, November 6th, the early part.

Q. Have you any personal knowledge of how the contents of these barrels was dumped into the canal?

A. I was not present.

Q. I believe you stated that your brother made the deposits?

A. Yes sir. I can tell you how the barrels were prepared, the kind of bungholes in them, etc., because that was done here.

Q. Yes, that was done here. You have stated that.

At the time of the dumping of the contents of these barrels into the drainage canal had there not been an examination of the waters from Lake Michigan and the St. Louis Intake, by yourself and another representative of the complainant in this case, and by the experts employed by the defendants?

A. Yes sir.

Q. Was there any reason why you should not have consulted the experts on the part of the defendants, in the making of this deposit, and ask their assistance in making the preparation, and also in the subsequent investigations as to the appearance of these bacteria in the waters?

A. Yes sir.

Q. What was that objection?

A. There was no objection; there was an agreement that
we should collect samples at the same place, and at the
1495 same time but that if any special work was to be carried
out, we were to do it independently of the other.

Q. With whom did you make that agreement?

A. We made that agreement—I think it was with Mr. Randolph and the Board of Trustees, but that was made through Mr. Schnurmacher. He was then the City Counsellor, and that letter is in the files of the department.

The idea was this, that we didn't care to stop at any minute and notify the Chicago bacteriologist that we wanted to carry out some special work.

Q. Did you have this particular work in mind when you made that exception to the rule, which was to govern thereafter, namely, that they were to be taken in the presence of experts on both sides?

A. Yes sir.

Q. Had you any reason to believe that the experts on the part of the defendants would have objected to this kind of an experiment being made?

A. I had none whatever.

Q. Didn't you think it would have been more in accordance with the spirit of the existing agreement if you had invited these experts to participate in the preparation of these cultures, and also in the subsequent examinations as to their appearance in the waters? 1496

A. That seems to have been not the case when the matter was presented to the legal end of the investigation. We were instructed, that when we had any experiments to carry out specially, to do them ourselves.

Q. So you knew on your part then, of no objections that would be offered on the part of the experts of the defendants to this kind of an investigation?

A. None other than that they would have had to increase their bacteriological force to the extent of several men to carry out this experiment in the way in which we intended to do it.

Q. How were these barrels shipped from St. Louis to Lamont?

A. They were shipped by freight.

Q. On what railroad?

A. Now, I don't remember now. I think it was the Chicago & Alton, if I remember correctly. It passes through Lamont.

Q. That railroad that passes through the town of Lamont?

A. Yes, I think it was the Chicago & Alton.

Q. Was there not a statement made to the authorities with whom you came in contact at Lamont, to the effect that the contents of these barrels was vinegar that had been condemned, and was to be thrown out? 1497

A. I don't know what statements were made to these individuals.

Q. You made none yourself?

A. No sir.

Q. You don't know what pretext was offered so as to enable the parties to get the contents of these barrels into the canal?

A. I do not.

Q. Well now, what occurred after the emptying of the contents of these barrels at Lamont, so far as to tracing the presence of the bacteria at other places?

A. The samples were collected every hour, day and night.

Q. Where?

A. From all stations, Lockport, in the Canal, Joliet, above Peoria, or at Peoria, right at the town.

Q. In the lake?

A. No no, below the narrows:

Q. Below the narrows?

A. Yes sir.

Q. Doesn't the lake begin at the narrows?

A. Well, the lake empties into the Narrows, does it not?

Q. No, the narrows empties into the lake.

A. It was in front of the town, so that a man—in order
1498 to have a helper, we had to employ a man that lived on the river, and it was impossible to get a man on the river at the point of the regular collections of samples, so a man who lived near the city was employed by Dr. Rush.

Then at Grafton men were employed to collect samples day and night. Mr. Tedesche, a bacteriologist, was at that point with a collector, and arrangements were made to collect samples day and night, every hour. Then later, arrangements were made with a man named Homer and his son, by whom samples were collected day and night, and they were watched occasionally at night by a man stationed at Grafton, to see that they were doing their work carefully.

Then we had men stationed at the Intake Tower of the Water Works, St. Louis, these men lived in the Intake tower, and went down on a ladder to a boom or scow or something of the kind which was fastened in the water at the bottom of the tower and took samples there every hour, day and night.

Q. During what periods of time were these various samples taken?

A. They were collected—

Q. Beginning at Lockport and ending with the Intake tower, St. Louis?

1499 A. They were taken continuously and as soon as possible the laboratories were notified.

On the evening of November 6th, Mr. Ravold reached Joliet, went to the laboratory in which Dr. Kirschner lived and notified him. Men were sent out and began collecting samples at Joliet that night. The next day they began at Lockport, and samples were continuously collected day and night straight along through that time.

Q. From when?

A. Say beginning November 7th.

Q. And continuously taken from that point to what point?

A. To the Intake tower, and that work ceased about March 1st, 1902.

Q. Well, did you take samples upon the same days at these places or upon subsequent days?

A. That was every day.

Q. Every day at all the places?

A. No, every day at Lockport until the bacteriological laboratory staff left there.

Q. When was that?

A. That was on November 27th, I think.

Q. The 27th.

A. Yes sir.

1500 Q. Now how long did you take them at Peoria?

A. Same length of time.

Q. From October 9th to November 7th?

A. From November 7th to November 27th, at Lockport. At Peoria they began at about the same time.

Q. Same time as at Lockport?

A. Yes, it may have been the 8th; it was done within a day.

MR. TODD: I would like to ask you a question, doctor. Did you take samples at all these different locations that you have indicated, from Lockport to the waterworks in St. Louis on the same days?

A. Oh yes, that was continuously done. They began at Joliet, I think a day before Peoria. They would have begun then on the 7th, at Lockport and on the 8th, Dr. Rush at Peoria began taking samples, because Mr. Ravold, who emptied the broth into the Canal went straight to Joliet and notified the laboratorian there, he then took a train that night at midnight, the midnight train, and landed at Peoria the next morning and notified the laboratory there that the material was coming, and Dr. Rush began collecting at once, arrangements were made so that on the 8th of November, they were all at work.

Q. How many stations were you taking samples from on the 8th?

1501 A. Two.

Q. On the 9th?

A. Let's see—I must say three, say Lockport above the Controlling Works, Joliet and Peoria.

Q. That was on the 8th?

A. Yes sir.

Q. Now on the 9th?

A. On the 9th at those three points.

Q. On the 10th?

A. On the 10th, I think Mr. Tedesche was notified, to begin taking samples at Grafton, but I am sure that by the 12th, he was also taking samples at Grafton, so that by the 12th, we were taking samples every hour day and night at Lockport, Joliet, Peoria, Grafton.

Q. And on the 13th?

A. Continuously taken.

Q. Were there any other stations except those four?

A. None other.

Q. When did they begin taking samples at the Intake?

A. They began about the 15th of November; I don't remember the exact date, but it was about the 15th, and that was continued in that tower.

Q. So that on the 15th or 16th, they were taking at the stations previously mentioned by you, and at the Intake?

1502 A. Yes sir.

Q. Were those all the stations that you were examining then at that time, for the deposit of these samples at Lamont?

A. Understand they were taking hourly samples, day and night at these particular points. We were also collecting samples daily from the Mississippi River at Alton, the Mississippi River at Hartford, and hourly samples were being taken in a cross section of the river, from the Illinois shore, Chain of Rocks to the Missouri shore.

Q. What day was it that you began to take samples at all the stations from Lockport to the last station you mentioned, across the river?

A. Well, you understand we were taking daily samples right straight along, from early in September.

Q. The point I want to get at doctor, is the time that samples were being taken daily from all the stations that you had established between Lockport and St. Louis?

A. November 15th.

Q. Then they were in full operation?

A. They were all in full operation and we were taking cross-sections, across the river, right straight along. We were taking hourly samples in the river from a boat at the Chain of Rocks, but when the water got cold, and the ice began
1503 floating in the river, it was torture for a man to be on the
river at night so we put him in the tower.

Q. November 15th then, all stations were in operation?

A. November 15th, all stations were in operation.

ATTORNEY GENERAL CROW: What was that date?

A. November 15th.

BY JUDGE SPRINGER:

Q. Now how long did this continue then from the 15th of November to the date last mentioned?

A. Well, it continued at Lockport from November 7th until November—I will give you the exact date of when these men left—to November 25th at Lockport and Joliet.

From November 8th, at Peoria to November 30th.

Q. And at Grafton?

A. At Grafton, Mr. Tedesche began taking samples by the 12th. I have not the date in my possession, just exactly when he began taking samples hourly, but I have it in my notes from him, he ceased work on November 27th.

Q. At Grafton?

A. At Grafton. But we sent a man there immediately, so that one day elapsed between the time that Tedesche ceased

taking samples, and the time that we established another
1504 man in the laboratory there.

Q. How long did he continue there?

A. He remained there until December 15th, employing two men by the name of Homer, father and son.

MR. TODD: Did he begin about November 8th?

A. Tedesche?

Q. Yes?

A. No, I think he began later, I think he began about the 10th or 12th. You see Mr. Ravold went first to Peoria and then returned from Peoria to St. Louis, notifying me that the bacteria were coming, and I wrote to Tedesche to begin taking samples. My brother Mr. Ravold arrived from Lamont on the 9th, in St. Louis, and I wrote to Tedesche at once, so it would be between the 10th and 12th, somewhere, that he began taking samples hourly.

BY JUDGE SPRINGER:

Q. Now the next place at which samples were taken during that period was where?

A. Was the Intake Tower, Chain of Rocks, and the Illinois shore, Chain of Rocks, that would be November 15th.

Q. You began there November 15th?

A. Yes sir.

Q. 1901?

A. Yes sir.

1505 And when did you cease to take the specimens at these points with the view of ascertaining the presence of this bacterium prodigiosus?

A. In December, I think, the work ceased at these particular points, about the 15th or 18th of December, I have not the date exactly, but I know that our money ran out about that time, and that the men were taken out of the tower. I continued personally, collecting the samples from the laboratory tap, from about November 20th, night and day until March 1st, 1902. I collected a great many of the samples myself during the day time.

Q. Now about your investigations at what you call the tap in your laboratory office?

A. Yes.

Q. When did they begin with a view to ascertaining the presence of this bacterium?

A. I think about November 20th, that is the statement I made, Mr. Todd, wasn't it?

MR. TODD: Yes, November 20th to March 1st.

A. To March 1st.

JUDGE SPRINGER: 1902?

A. 1902.

Can you state at Lockport for instance, which was only
1506 a few miles from Lamont, when you first discovered the
appearance of this bacterium?

A. I never did any work at Lamont myself, or at Lockport.

Q. I mean at Lockport?

A. I did no work at Lockport myself.

Q. You have no means of knowing that?

A. I did not work there myself—but Dr. Kirschner did, he was the one in the laboratory there.

Q. And the same at Peoria?

A. Same at Peoria. I did no personal work at Grafton, I did no personal work at Peoria. The personal work I did and upon which I testified some time ago, was at the laboratory in St. Louis, and the work of plating was done by myself and several assistants who were put on to aid in the work because it was a tremendous task.

Q. Did you make the bacteriological examinations of the specimens taken at the St. Louis Intake, Chain of Rocks?

A. Yes sir.

Q. You made those yourself?

A. I made those myself, watched the plates and all that.

Q. You didn't make any others?

A. I made no others.

Q. Now will you state what you discovered,—or the
1507 first discovery of the bacillus prodigiosus in these investigations?

A. The bacillus prodigiosus was found in the St. Louis laboratory in samples collected by collector Werner—

Q. Chain of Rocks first?

A. I say, laboratory, St. Louis, some samples collected.

Now I will give you the man's name,—collector Werner, above Intake tower, Chain of Rocks, December 4th, at 8:45 in the morning, he collected a sample—

Q. That is the first one that you examined?

A. No, no, it was the first one in which I found the prodigiosus. He was collecting hourly. Let's see. He collected this particular sample at 8:45 in the morning, in front of the Intake tower.

Q. But you investigated previous to this time?

A. Oh, yes, it was December 4th that he collected this sample of water. I began on November 20th.

Q. That is, you were looking for this bacterium preceding December?

A. Yes, I began November 20th, on the samples collected hourly at this point, Intake, Chain of Rocks, and Illinois shore, Chain of Rocks—the men went out in a boat and collected samples every hour.

Q. And you found nothing?

1508 A. I found nothing up to this date.

Q. The first sample was?

A. December 4th, sample taken at 8:45 in the morning.

Q. What did you find then?

A. I found the bacillus prodigiosus in the sample.

Q. To what extent did you observe its presence at that time?

A. I found only one.

Q. Only one?

A. That is, I found one colony, I believe. Now, I can tell you how much water we plated, and all that sort of thing. In fact, your Health Commissioner was here with me while I was working, several times.

Q. You couldn't state, then, the number of bacteria per cubic centimeter on that specimen?

A. Oh, I don't think I found more than one in a cubic centimeter.

Q. Well, when did you begin to find some more?

A. I found another on December 5th.

MR. TODD: Let me understand. When you say you found one, does that mean one of these organisms, or one colony?

A. One organism, I suppose, one colony grew on a plate.

Samples were plated in gelatine, and wherever a bacillus
1509 happens to be fastened in the gelatine when it hardens
there he grows and forms a little colony.

JUDGE SPRINGER: The colony was formed after it was captured?

A. Oh, yes, the bacillus has to grow to form a colony, and this particular bacillus liquifies gelatine and produces a red pigment, so it was easy to find in this medium.

ATTORNEY-GENERAL CROW: That was on December 4th? The first one?

A. The first one was December 4th.

Q. What date did you say they were put in?

A. They were put in on November 6th.

Q. JUDGE SPRINGER: Those that you denominate as cultures, were not those that were deposited in the river, but were the off spring of the bacterium which you put in the water?

A. Well, that is a point for argument. It was in November. The water was very cold, the weather was cold, and the question of whether these bacteria would grow in cold water was taken into consideration and experiments carried out to ascertain this fact, and it was found that on the contrary they
would not grow in a water with the temperature near the
1510 freezing point, which obtained at this time, and during
December the water was frozen on the surface. Our men collecting in December at Grafton went out on the ice. The same thing at the Chain of Rocks, and as I say, I took the men off the river from the boats and put them in the tower, because there was ice floating in the river. The water was cold, and the chances are that there was very little growth, if any, of bacterium as it floated down the river, it simply depending upon its inherited vitality, to keep alive, so I will state emphatically that I think there was no growth of the bacteria at that time in the water. The individual bacterium put into the canal at Lamont undoubtedly floated all the way and lived.

Q. The first one you found was December 4th?

A. December 4th, at 8:45 a. m.

ATTORNEY-GENERAL CROW: Where was that?

A. At the Intake tower, Chain of Rocks, right above the Intake.

JUDGE SPRINGER: In the specimen collected there?

A. Yes, sir.

Q. At what subsequent time did you find this bacterium in the specimen of water taken from the Intake tower?

A. In another specimen taken at 9:00 a. m., on December 5th, collected by Collector Werner, I again found the bacillus prodigiosus.

1511 Q. To what extent was that?

A. That is qualitative; it is not quantitative results. In order to obtain the quantitative results, I would have to take one part of water and dilute it to 1,000 parts to see if the microorganism was in the water. On that day we took one cubic centimeter of the water sowed it in gelatine, in the hope we would find one or more prodigiosi. So a plate on December 5th showed a growth of the bacillus prodigiosus, and that sample, as I say, was collected at nine in the morning.

Q. Was that one or more?

A. Well, this plate was pretty well liquified, whether there was more than one on the plate, I could not say, but it showed a red coloration in a liquified medium, so I couldn't say whether it was one or several.

Q. When did you find it again?

A. In a sample collected at midnight on December 6th, by Mr. Stevenson, in the tower. He was in the tower at midnight and went down along the ladder and took a sample at the bottom of the tower in the river, at the foot of the tower, so that he collected this sample at midnight on December 8th and the bacillus prodigiosus was found in plates made from this sample.

Q. Well, did you state these investigations in your examination in chief?

1512 A. I did not.

Q. Then, when was the next investigation made and what did you find?

A. I next found the bacillus prodigiosus in sample of water collected by Mr. Homer at Grafton, Illinois, in the Illinois River on December 6th, at 8:00 a. m. He collected the sample at eight o'clock in the morning. It was sent to St. Louis and in that sample the bacillus prodigiosus was found by me.

Do you want the next sample?

Q. Yes, sir?

A. The next sample was found by Collector Homer at Grafton, Illinois, Illinois River, at midnight, December 7th.

That was all the times that I found it.

Q. That was all the times that you found it?

A. Yes, sir.

Q. Did you make any efforts subsequently to that date to ascertain the presence of this bacterium in the waters of the Intake Tower?

A. Yes, sir, continuously.

Q. Until when?

A. Until December 15th or 18th. I am not so sure, Judge, just exactly what time that work ceased, but it ceased when our money ran out.

Q. Yes, you didn't find it after that at all?

A. No. I continued searching the tap water in the laboratory until March 1st, 1902. 1513

Q. What did you find then?

A. I never found it again.

Q. How many samples did you examine in all for the purpose of ascertaining these five specimens personally, from the time that they were put in at Lamont until the close of your investigations?

A. December 15th, about, we began, and we collected samples day and night. That would be at this place 30 days, and 24 samples were collected a day. That is 720 samples that I personally examined at this point.

Q. And you only found in all those examinations the presence of this bacterium five times?

A. Now, hold on; you are talking about the Chain of Rocks now?

Q. Yes, I am talking about the Chain of Rocks.

A. Yes, I said 720 samples, being collected for this purpose. There were other samples being collected right along for quantitative determination of the numbers.

Q. But I mean these samples for the prodigiosus.

A. Yes, sir. Now, at Grafton, say 16 days, 24 samples a day, would be 384 samples—that would be —

Q. At Grafton?

1514 A. At Grafton, personally examined by me.

Q. And you found the bacterium how many times?

A. Twice.

Q. Twice?

A. On December 6th and 7th.

Q. Now, how many at the Chain of Rocks?

A. Three.

Q. How many samples, I mean, were examined at the Chain of Rocks?

A. There were 720 samples collected for this one purpose.

Q. I am speaking of this one purpose, yes?

A. There were samples collected for other purposes, and it didn't appear in them.

Q. And you found it in that period in how many?

A. 720 samples or five times in 1100 samples.

Q. Can you express in quantities such as are generally used in bacterial examinations, the numbers of this bacteria that were found on these five occasions?

A. That would be qualitative, wouldn't it—estimation?

Q. Yes, quantitative estimation, taken from your qualitative examinations?

A. I cannot tell how many bacteria—how many bacilli prodigiosi were in the particular sample of water, nor in
1515 the small quantity that I used. I know that the first plate had only one colony on it, and we were very much excited about that. That was December 4th.

Q. What was that?

A. There was only one colony on the plate on December 4th.

Q. That would indicate that there was only one?

A. That would indicate that there was only one in that particular cubic centimeter which was put in that plate, a number of plates were made from each sample.

Q. On the next one, how many colonies were produced?

A. I don't know. I said the plate when I saw it, was liquified.

Q. It was all run together?

A. It was all run together, so whether there was more than one colony at the time, I don't know.

Q. Well, the same conditions were substantially found on December 6th?

A. Yes, sir.

Q. And at the other places?

A. And at the other places. We allow the plates to rest as long as possible to gather the red color, and the plate might liquify before the color appears. It is impossible to say anything about the number on a plate.

Q. When you discovered the red color you had accom-
1516 plished all you were looking for and ceased?

A. No, the red color was an indication that a bacillus producing a red pigment was there; that bacillus had to be separated out in a pure culuture and put through all its cultural characteristics and studied for form. In fact we searched thoroughly to see whether it was the one we put in the canal or not, and compared it with the ones put in.

Q. Were you able to identify it as the genuine article?

A. It had no label on it; no name blown on the bottle, or anything of that kind, but it behaved like the original culture.

Q. It was of good behavior, was it?

A. Yes, sir.

Q. Doctor, have you ever examined any of the waters on this continent for the purpose of ascertaining the presence of the bacillus prodigiosus other than that which you have just mentioned?

A. No, sir, I have never undertaken such a tremendously extensive investigation as was included in this work on the Drainage Canal and the Illinois River, but I have never found it in any of the waters which I have examined in this country, and my laboratory assistant, my associate, was Mr. Johnson, as clever a water bacteriologist as there is in this country, he worked continuously on the Ohio River above Louisville and
Cincinnati, for two or three years and did not find it in
1517 that water, and I understand that a bacteriologist who
worked at New Orleans—one of them told me this—that he once found the prodigiosus in the Mississippi River near New Orleans, after we had emptied it into the Drainage Canal.

Q. And then as far as your knowledge extends, and from personal knowledge and from information of others, all examinations on this continent heretofore, have not revealed the presence—

A. Not in large numbers.

Q. —of this bacteria?

A. I would say that it has been found a very few times—I searched the literature on the subject—in the waters of the United States.

Q. What were the peculiar characteristics of this bacterium that enabled you to identify it?

A. It is one of the most easily identified of all bacteria.

Q. In what respect?

A. In its pigment production.

Q. Color?

A. The pigment that it produces. It liquefies gelatine, and produces pigment; it coagulates milk and turns that milk red without digesting the casein which is the result of the coagulation, and makes it very characteristic at once.

Q. But all bacteriological examinations carried on with the view to ascertaining the quantitative presence of bacteria in running water or lake waters, reveal the presence of this bacterium? 1518

A. Yes, sir.

Q. They would?

A. Oh, yes, every man who studies water quantitatively—Every bacteriologist is mad in the search of new forms. He wants to have a bacillus named after him if he can, or he wants to find one and name it. He wants to have his name go down in literature as associated with a bacterium—every man that plates a specimen of water is searching that water constantly for new forms.

Q. Well, doctor, there are a great many examinations of this kind that have been carried on in recent years?

A. Yes, sir.

Q. All over this country?

A. All over this country.

Q. And you will not say that no other bacteriologist than those you have mentioned, and yourself, have not found this—

A. Oh, no.

Q. —particular bacterium in the waters of the United States?

A. No, I couldn't say that.

Q. You simply haven't found it, and those with whom you have conversed, whose names you have mentioned, have not found it?

A. I see also from your investigation, the book published 1519 by the State Board of Health of Illinois, I don't see the prodigiosus named among the bacteria found by the Northwestern men.

Q. In the waters of the Illinois River?

A. Yes, although they have got quite a number of bacteria separated out, as distinctive for these waters.

Q. That report, however, did not include any specimens taken from the waters of Lake Michigan, did it, with the view to this particular bacteria?

A. I don't know whether it did or not.

Q. Have you ever made any examinations of the waters of Lake Michigan?

A. Yes, sir; oh, yes.

Q. Did you make that examination in connection with this investigation?

A. Yes, I have had samples collected, and the water was studied thoroughly, and I gave you the—

Q. All the flora?

A. I gave you all the bacteriological flora found by us in the Lake Michigan water. That has already been submitted in evidence.

Q. And you didn't find in those examinations, any evidence of the presence of the bacillus prodigiosus?

A. No, sir, nor in the Chicago River, or the Drainage Canal.

1520 Q. You have stated all that in your previous examination?

A. Oh, yes, that has already been gone over.

Q. That is all in the record?

A. Yes, sir.

Q. Now, what is your opinion as to the probability of reproduction or multiplication of numbers of the bacillus prodigiosus after being deposited in the waters of the Drainage Canal?

A. As I said before, that point was kept clearly in mind before the bacteria were deposited—the water was cold, almost to the freezing point, before the bacteria were put into the water. We felt perfectly confident that there would be no multiplication of micro-organisms under these conditions of temperature and nutritive pabulum, etc., which would surround the bacteria in the waters of the Drainage Canal or the Illinois River.

Q. So then, it is your opinion—

A. So it is my opinion that these micro-organisms did not multiply in the transit from the point where they were put into the canal to the intake, and if they did so, it was very feebly so, because they do not multiply under the conditions named; they do not multiply below 10 degrees centigrade.

Q. What would be the temperature of your water mains in reference to their possibility of reproduction?

1521 A. Here?

Q. Yes, in the City of St. Louis?

A. Well, the temperature of the water running from the tap at that particular time; I don't remember, but we took the temeprature of the water from the tap during this period and that is on record. I haven't the record with me, but the temperature would be higher than in the water of the running stream.

Q. It would not be quite so cold?

A. No.

Q. But would it be up to a point at which there would be a probability of reproduction or multiplication of species?

A. Not the production, no. It was low, but above freezing.

Q. Doctor, have any of the witnesses who took samples, who have testified heretofore—were any of those witnesses who took samples heretofore, the ones who have testified, up to this time, those who took the samples to which you have referred this morning, betwen Lamont and this city?

A. Yes, sir; Dr. Kirchner has testified here.

ATTORNEY-GENERAL CROW: Mr. Werner also.

A. Dr. W. C. G. Kirschner, the bacteriologist, who testified here. Doctor Rush, who did the work at Peoria is now in Berlin, Germany.

Mr. Tedesche is somewhere in this country, but Dr. Kirschner, who has already testified, and every one of the col-

1522 lectors who collected samples—Werner and all the others, I believe, excepting Stevenson, have testified about collecting samples.

Q. Up to this time?

A. Yes, sir.

Q. They are in the record some place, I do not remember?

A. Yes, they are in the record.

Q. Then you have identified the samples that were taken during this period with the view to ascertaining the presence of this bacterium by the persons who took the samples, and all those who made the bacteriological examinations other than those made by yourself?

A. Yes, sir.

Q. The others were made by Dr. Kirschner?

A. Dr. Kirschner at Joliet, and Dr. Rush at Peoria.

Q. Did Dr. Kirschner say anything in his examination about the presence of the bacillus prodigiosus?

A. Yes. I don't know what he said here; I was not present when he was examined. He said nothing to me about his examination.

Q. He didn't reveal that fact if he found the presence of this organism?

A. I don't know what he testified to, or whether his direct examination had anything to do with this prodigiosus, had it?

ATTORNEY-GENERAL CROW: No, I stated, if you will remember, that when Dr. Kirschner testified on the stand,
1523 that I would recall him.

JUDGE SPRINGER: It didn't come to my mind that he had testified about that, but you expect to recall him on that subject?

ATTORNEY-GENERAL CROW: Yes.

Q. Have you stated your opinion previously as to the probable longevity of the bacillus prodigiosus?

A. Yes. You will remember I gave you a series of tables on the longevity of the prodigiosus and also on the longevity of the prodigiosus as associated with the typhoid bacillus, in samples alongside of one another, in the window with the sun shining upon it, and in the ice chest?

Q. Yes, I remember.

A. Those tables are in the record.

Q. I remember that. Can you remember, now, what you stated was your opinion as to the longevity of this bacterium?

A. Yes, I can give you the exact facts.

Q. Well, you need not give all of them; I just wanted to get that one, if you have given it in complete tabulated form—

A. Do you want me to give you these different points, the longevity that was obtained in the waters at the different points of collection?

Q. No, not all of the points. You may state one.

A. Well, from ten days to 32 days in the sunlight, and as high as 53 days, at which time it was still alive, that is, the work ceased, as in the living waters.

1524 Q. In the living waters?

A. Yes, sir.

Q. You made no other examinations of sterilized waters; I presume it wasn't necessary?

A. In sterilized water of the Chicago River, exposed to the window, it lived 11 days.

Q. It lived 11 days?

A. Yes, lived 11 days. In the refrigerator, in the dark, in a temperature of 16 degrees centrigrade, it lived 53 days, and still alive when the work ceased.

Q. That was in sterilized water?

A. No, I said in sterilized water, in sunlight, we had one experiment, but in the living water is what we were talking about.

Q. That was the longest period of longevity which you ascertained, of this bacterium?

A. Yes, sir.

ATTORNEY-GENERAL CROW: No, that is not the Chicago River water.

JUDGE SPRINGER: No, I am speaking of this bacterium, where you found it.

A. In the Illinois River, Pekin, not sterilized, temperature 16 degrees centrigrade, it lived 53 days; that is at the end of 53 days it was still alive; but our work ceased; our pay

1525 ceased, and it was the end of the experiment.

Q. So that if it lived longer than that you have no record?

A. I have no record, but I have got 53 days longevity in the refrigerator, and that was about the temperature of the river water at the time the micro-organism was thrown into it, 16 degrees centrigrade, even lower than that.

Q. I believe you stated that this bacterium was of the ordinary water species ?

A. Yes, sir.

Q. And perfectly harmless?

A. Perfectly harmless, chromogenic species, a saprophite.

Q. You just used the word saprophite?

A. Yes, sir.

Q. Will you please explain what you mean by that?

A. It is used—"sapros" is from the Greek, "sapros" meaning dead, and phyte meaning the organism. They grow upon a dead body or in dead organic material.

Q. Animal or vegetable?

A. Yes, animal or vegetable, in contradistinction to parasite, which lives upon living structures.

MR. WOERNER: Phite means body, doesn't it?

A. No, it means fungus.

Q. JUDGE SPRINGER: That would indicate two general classifications of bacteria?

A. Yes, sir.

1526 Those known as saprophites and those known as parasites?

A. Yes, sir.

Q. Now, what is the peculiarity of the parasite?

A. The parasites are able to grow upon living structures and reproduce their kind.

Q Living organisms—you mean animal and vegetable?

A. Animal and vegetable; some live practically without doing injury to the individual, others are disease-producing and thence comes the classes, pathogenic and non-pathogenic.

ATTORNEY-GENERAL CROW: Some are both?

A. Under the word parasite we have pathogenic and non-pathogenic.

ATTORNEY-GENERAL CROW: Some bacteria grow on the dead and some on the alive—

JUDGE SPRINGER: Those are the saprophites, on the dead one.

A. The saprophite grows on dead animal and vegetable structures.

Q. And a parasite must be living?

A. The parasite must be living. The word "parasite" includes that.

Q. It mentions that it is found in the skin?

A. Yes, some in the skin, in the hair, in the—some of it lives in the intestinal canal.

1527 Q. In what class, then, does the pathogenic organism come?

A. They come under the parasite, pathogenic. Under the word "parasite" are included pathogenic and non-pathogenic bacteria, because some of the bacteria which live and grow upon our skin, for instance, are harmless, or those in our intestinal canal, are harmless to us, in fact, those growing normally in the intestinal canal might as well be on the skin, on the outside, for all the harm they do.

Q. Which of these classes do you find to be the most numerous?

A. The saprophites are distinctly the more numerous.

Q. And those are all mostly non-pathogenic—the saprophites, I believe?

A. Well, they are non-pathogenic except when injected under the skin. Some of them are pathogenic, but when they find a breach in the tissues of an animal in which they may grow,—some of them are able to grow as a saprophite, and are saprophitic by nature, but if they find entrance into the living structure, through a breach of the continuity in that structure—

Q. For instance, a wound may produce suppuration?

A. Yes, it might produce suppuration.

Q. But taken internally they are perfectly harmless?

A. As a rule.

1528 Q. Now, can you state what particular function in animal existence and in vegetable existence and reproduction, these saprophitic organisms play—what part they take?

A. The saprophites, as I said in my opening address, are the undertakers of the organic world; they reduce the dead structure of plant or animal by their actions upon the complex compounds of which they are composed; break them up into lower and lower compounds until resolved into nitrogen, carbon oxide, ammonia, hydrogen, and water, hydrogen and oxygen combined.

Life on earth would be impossible without them as they prepare, by their destructive action upon organic materials the compounds which are taken up by plants in their growth and the animals upon the earth feed upon the plants and each other.

Q. So, then, it is by means of bacterial activity that nature is restored after its exhaustion, from the production of the original matter?

A. Yes, sir.

Q. And without this there would be no continuation of animal existence or vegetable existence?

A. Yes.

Q. Allow me, doctor, to supplement your statement by a sentence taken from Dr. Abbott, in his work published in 1902, on this very point.

1529 He says:

"Were it not for the activity of these microscopic living creatures, all life upon the surface of the earth would cease." Is that correct?

A. That is right.

Q. "Deprive any vegetable of the carbon and nitrogen supplied to it as the result of bacterial activity, and its development comes rapidly to an end. Rob the animal kingdom of the food stuffs supplied to it by the vegetable world and life itself is no longer possible.

It is plain, therefore, that the saprophites which represent the large majority of all bacteria, can be looked upon in the light of benefactors; without them existence would be impossible." Is that correct?

A. Yes, sir.

Q. That is the well recognized theory of all bacteriologists upon this subject?

A. Yes, sir.

Q. Then in making mere quantitative tests as to the bacteria in water, a large or small number of saprophites would not be regarded as any indication of any evil or pollution in the water, would it—the mere numbers, I am speaking of?

1530 A. Oh, yest, it would. It would depend upon the stage of the river entirely. If the river were high, due to floods and rain upon the drainage area, the saprophitic organisms are found in large numbers in the water. Rain water washes them out of the soil into the river, and so they are carried along.

Q. I am not referring to that. I understand that.

A. But when the river is low and the number of bacteria discharged into it by brooks, by the springs which discharge their pure water into it, the numbers of bacteria are very low, and these are saprophites, as a rule, in nature. But if into this stream which was originally pure, is poured sewage, for instance, which is food for bacteria; so far as that sewage is carried, so far will the bacteria appear in increased numbers, because they find food to feed upon.

Q. But I am speaking now of the mere presence, without regard to the environment of the collection of samples?

A. No, do you mean, then, that the earth surface has been washed of its bacteria and they appear as in a freshet in large numbers, or that there was nutritive material either of vegetable or animal origin present in the water in such large quantities as to afford abundant food for an increased production of bacteria in it, these two points would have to be taken into consideration in a discussion? The question of rainfall on
1531 the area at the particular time when the numbers were
large, or if the number were large independent of the rainfall, it would indicate that there was food either of vegetable or animal origin in the water, and the source of that food supply would have to be searched for along the stream.

Q. Then your position is this, that the ordinary bacteria flourish where they find something to eat?

A. Yes, sir.

Q. And disappear when the supplies give out?

A. Yes, sir.

Q. So that they are plentiful where there is food adapted to their existence, and scarce when the food supply is exhausted?

A. Yes, sir.

Q. Now, does it not frequently happen that there is a large amount of these bacteria developed in places where there have been no pollutions from animal matter?

A. If the pollution is due to recent addition of vegetable matter, that would be food for them.

Q. Yes?

A. Yes, sir.

Q. It may solely come from decomposed vegetable matter?

A. Yes, sir.

Q. It is universally admitted, I believe, among bacteriologists that bacteria are of vegetable origin?

A. Yes, sir.

1532 Q. That includes both the saprophites and also the parisitic?

A. Yes, sir.

Q. All of vegetable origin?

A. Yes, sir.

Q. So these are simply low forms of vegetable life?

A. Yes, sir.

Q. Are these bacteria known as the saprophites, useful in any of the arts?

A. Oh, yes.

Q. What kind of production requires them?

A. First, the production of alcohol, and it is destined to become one of the great arts, because it is probably the future source of our fuel supply.

Q. What function is performed by bacteria in the production of alcohol, for instance?

A. The yeast cell, which is classed among bacteria, breaks up the prepared sugar in the wort of the distiller, into alcohol and carbon di-oxide. The carbon di-oxide passes off as a gas, and the alcohol remains in solution.

After the bacteria have produced from 12 to 16 per cent.
of alcohol in the wort, or broken up Dextrine and starch contained in the wort to the extent of producing 12 to 16 per cent.
of alcohol, their activity ceases, owing to this poison alco-
1533 hol which they produce themselves, the distiller knowing
the proper moment when this point is reached, distills off
the alcohol and runs out the bi-product as swill. That is the present method of producing alcohol—or one of them.

Yeast is used in brewing. In the production of yeast cakes for all industrial purposes in general. Bacteria are used in the production of good well flavored butter; for the production of cheese, and the ripening of the cheese, in the destruction of sewage in septic tanks, in the production of vinegar, and in a number of other industrial processes —

Q. In the tobacco culture?

A. Well, they are said to produce the delicate flavor or aroma that is connected with some better flavored tobacco such as Havanna tobacco.

Q. You stated that the saprophitic bacteria are used in the production of beer?

A. Yes sir.

Q. Can you make beer without the use of bacteria?

A. Not the German beer as we know it,—lager beer.

Q. The presence of bacteria is essential to the production of beer?

A. Yes sir.

1534 Q. And are the species required for that cultivated?

A. Yes sir.

Q. How are the cultures prepared?

A. There is one man at Copenhagen, who has done the most advanced work in that line. That is Hansen; but Pasteur was the first to take hold of this subject and straighten it out, so that in front of all breweries in France, you will see either a statute of Pasteur in the yard or a bust of him above the door, because he is the first who separated out the particular yeast cells which produce the best flavored beer. He was also the first to separate out the micro-organisms which cause the so-called disease of beer—sour beer or bitter tasting beer. He discovered some of the causes for that, and so put into the hands of the brewers of France a scientific method of working in place of the haphazard methods which they used before. Elevated it from an ordinary layman's work to a scientific process, and the Germans have improved upon it. Hansen, as I say, of Copenhagen, has carried on extensive work with different forms of yeast cells that singly or in combination with others, produce the best flavored beer.

Q. Was he able to name the bacteria?

A. Yes, they have been named in large numbers.

1535 Q. In German, principally, I presume? Not translatable?

A. No.

Q. You may give the name of the beer bacillus, could you?

A. Oh, well, there are several. There is saccharomycetes, —Cerevisceal.

Q. Any other species?

A. There are a number of them,—saccharomycetes Pasteuri, named after Pasteur. There is quite a list of them many of which I have forgotten.

Q. Are those cultures prepared by certain chemists, and introduced into the commercial world as an article of commerce?

A. Yes sir.

Q. So that bacteria have become an article of commerce?

A. Yes sir.

Q. That is a good one, the saccharomycetes?

A. Yes sir, it is a well-behaving bacterium.

Q. Well, what do you say as to the production of butter?

A. Professor Conn separated out while working on milk and butter, bacillus No. 41 of his list, and that is the micro-organism which produces the delicious flavor of good butter. A manufactory was started and this micro-organism grown in pure cultures and sent to dairies throughout this country.

1536 Q. Is that a permanent thing in Europe too?

A. Yes sir.

Q. More extensive than in this country isn't it?

A. More extensive than in this country, yes sir.

Q. Without the presence of bacteria it would be impossible to make butter wouldn't it?

A. Yes sir.

Q. And also cheese?

A. Yes sir.

Q. So that butter making is an adaptation of bacteria to the milk produced by the cow?

A. Yes, butter can be made without the aid of bacteria, but you mean a well flavored butter,—good butter?

Q. Yes, I mean the best qualities of butter?

A. Yes sir.

Q. And—well, can you make butter at all without bacteria?

A. Yes sir.

Q. Isn't the surroundings of the milk an indication of the presence of bacteria?

A. You can surround milk with rennet—

Q. Isn't that an indication of bacterial action?

A. No sir, not exactly,—oh, no, we can coagulate milk with the rennets of the calf's stomach—that is done right along.

Q. Isn't it substantially fermentation?

1537 A. It is not fermentation; it is distinct from bacterial action.

Q. But the process by which milk is converted into butter, or by which cream is converted into butter is a process of bacterial activity, is it not?

A. Yes sir.

Q. In the ordinary process?

A. Yes sir.

Q. The ripening of the cream, preparing it for churning purposes is done through the agency of bacteria?

A. Yes sir, entirely.

Q. And the cultures for this purpose are being furnished by certain chemists and others for the purposes of improving the quality of butter that is made in the world?

A. Yes sir.

Q. And so in cheese I presume?

A. Yes, a variety of cheeses owe their flavor to the peculiar qualities of the contained bacteria.

Q. You stated yesterday that the milk supplied to this city was brought in jars that had been sterilized—or cans?

A. Cans, yes sir.

Q. Would such sterilization be sufficient to eliminate the presence of parasitic germs, or germs carrying disease?

1538 A. Yes sir, such as are water-borne, such as the typhoid fever and cholera germs; both of these micro-organisms are tender when brought in the presence of heat. They are destroyed, both of them, at 56 degrees Centigrade, by heating for a few seconds, and water brought up to boiling point kills them at once, so boiling water in cans destroys these bacteria.

Q. That would be only so far as the can itself is concerned?

A. Yes, that would kill all typhoid bacilli in the cans or in water that was in it.

Q. Are you aware of the presence of bacteria in milk from other causes than from the can itself?

A. Yes sir.

Q. What are they?

A. Bacteria falling from the cow in the process of being milked. The bacteria from the hands of the individual milking, and hair blown, or hair deposited in the milk while it is standing.

Q. Isn't it impossible by ordinary precautions, to prevent the presence of bacteria in milk?

A. Their numbers can be very greatly reduced by care in milking; but it is impossible to keep them out.

Q. Impossible to keep them out?

A. One way to have sterilized milk is to sterilize it.

1539 Q. So that all milk unsterilized, as it is furnished in the milk cans in the market would have more or less bacteria?

A. Yes sir.

Q. Professor Conn states in his work to which you have referred that the numbers of bacteria which may be found in milk after twenty-four hours, are sometimes inconceivable?

A. Yes sir.

Q. Market milk may contain as many as 500,000,000 per cubic inch, is that correct?

A. Per cubic inch?

Q. Yes, per cubic inch I said. Professor Conn uses the word.

A. I am surprised that he used that word. Yes sir, that is so. I have found immense numbers in it.

Q. And he states that where this is an extreme number, that milk that is a day old will almost always contain many millions in each cubic inch?

A. Yes sir.

Q. The number depending upon the number of days old and its temperature?

A. Yes, it is fine nutritive medium for bacteria, and we use it in our laboratory for that purpose.

Q. It is a fine medium for cultures of all kinds of bacteria?

A. Yes sir.

1540 Q. And especially when it is in the temperature which it has when it comes from the cow?

A. Yes sir.

Q. Before it comes out of the cow, I believe that it is stated that is is free from bacteria—as it is found inside?

A. It may have a few that are in the milk ducts of the cow; in the teat, but it is practically free; it is practically sterilized.

Q. The typhoid fever would never come in that way?

A. No sir.

Q. The typhoid fever germs, if found in milk, would be from extraneous introduction?

A. Extraneous source, yes sir.

Q. Now considering the vast number of bacteria that must necessarily get into the milk which is furnished to the consumer of milk in cities, like St. Louis, isn't the liability very great for communicating typhoid germs by the use of milk?

A. The danger is great where precautions are not taken to first clean the cans with boiling hot water. The cow milked under aseptic precautions, the milk cooled to as low a temperature as the surroundings will admit,--generally spring water is used for that purpose, and it is possible that a typhoid bacillus may be conveyed from, either diseased water which may
1541 be put in the milk or from the hands of the individual
who has typhoid, or who is associated with typhoid cases.

Q. MR. WOERNER: What do you mean by aseptic?

A. That is free from sepsis, meaning free from septic germs, free from germs that can produce disease.

Q. JUDGE SPRINGER: That is the term used in surgery?

A. Yes sir.

Q. For the purpose of cleansing wounds?

A. Yes sir.

Q. Isn't the only means of relieving milk from the presence of bacteria boiling it to at least 100 degrees centigrade?

A. Yes sir.

Q. That is the boiling point?

A. Yes, that relieves it of pathogenic germs.

Q. Yes, that relieves it of pathogenic germs?

A. Yes sir.

Q. Well is any of the milk furnished by the dairymen who supply the St. Louis market thus sterilized before it is delivered to their customers, as far as you know?

A. Well, I know there are people or dairies that supply a concentrated milk, or sterilized milk.

Q. That is concentrated milk?

A. And also sterilized milk if it be asked for, but the vast majority of dairymen supply milk without treatment
1542 by heat, or with heat.

Q. Some dairymen supply what is called Pasteurized milk?

A. Yes sir.

Q. Will you state what process is necessary for producing Pasteurized milk?

A. Yes, sir, Pasteurized milk means heating the milk for some time at a low temperature, 60 degrees centigrade, for an hour or more, the idea being to kill all pathogenic germs in it. By this treatment, spores are not destroyed, but it would kill all such bacteria as typhoid, cholera, tuberculosis, etc., organisms which do not produce spores, in other words—

Q. Then is it your opinion that one of the most probable sources of communicating typhoid germs to the inhabitants of cities is through the use of the milk supply?

A. I don't think you have stated that question exactly the way you want to put it—the probable source, you say?

Q. Yes, probable?

A. Oh no, it is not probable. The most probable source of typhoid bacillus is the water supply. You can eliminate the water supply by having a pure water.

Q. Well, then I will put the question in another way:
Is it not your opinion that it is highly probable that the
1543 typhoid germs may be communicated to consumers of
milk in large cities, and thus cause what is known as a typhoid epidemic?

A. Yes. Probably hardly one per cent of cases that occur in cities is due to the typhoid pollution of milk,—that is, right straight through.

Q. How can you ascertain that? If there are various causes how do you trace the cause?

A. I said that over 95 per cent of the cases of typhoid fever in a town or community is due to polluted water supply. Then there were several extraneous sources of infection, among which were named air-borne bacilli food, such as bacilli in oysters, on fresh vegetables, in milk, etc., and that this was a very small percentage of the total; that there have been occasional epidemics of typhoid fever produced and traced directly to milk, is not denied, but it was always localized along the line of the route of the delivery of the particular milk.

Q. The milk may be contaminated by the same water that reaches the stomachs of the inhabitants, without going through the milk itself?

A. Yes sir.

Q. So that there may be indirectly a large amount of germs carried through the milk supply?

A. Yes sir.

1544 Well now. I believe you stated that the bacteria found in water were very largely of the non-pathogenic kind?

A. Yes sir.

Q. That they greatly predominate?

A. Yes sir.

Q. That the non-pathogenic germs were essential in the production of many useful articles of food and drink?

A. Yes sir.

Q. And that the presence therefore of ordinary water bacteria in drinking water was not of itself, free from the environments of it, an evidence of contamination or of disease bearing quality?

A. Yes, unless present in enormous numbers.

Q. To suggest a probable source of that kind?

A. Yes.

ADJOURNED until 3:00 P. M., same day. Thursday. March 12th, 1903.

1545 Session resumed pursuant to adjournment at 3 P. M. March 12th, 1903. Present, the Commissioner and same counsel representing the respective parties.

DR. AMAND RAVOLD, further testified as follows:

CROSS EXAMINATION

By Mr. Springer.

Q. Doctor Ravold, there are one or two matters I desire to call your attention to. There is some doubt in the mind of the counsel whether you have stated that disease bearing germs increase in number in the water?

A. In running water?

Q. In running water, yes?

A. It has never been proved satisfactorily that they do increase in numbers in running water.

Q. It is still an uncertain quantity?

A. It is still an uncertain quantity, the numbers practically remain the same.

Q. The disease bearing germs that are supposed to have their origin in the intestines of animals, including human beings, the question as to whether after being discharged from the intestines they increase in number is still an open question?

1446 A. Yes sir.

Q. I believe you stated in one of your elaborate descriptions of the bacillus prodigiosus that it was motile?

A. No sir.

Q. What was it you said?

A. I said it was not motile.

Q. I misunderstood you. What did you say its size was?

A. From two-tenths of a micro-millimeter to four micro-millimeters in length and about five-tenths of a micro-millimeter in width.

Q. The dimensions given by Franklin in the work to which you referred this morning are as follows, the work of 1894, the cells are rather longer than broad, the largest forms being about 1.7 micrones in length?

A. That is micrones, that is a micro-millimeter.

Q. And about one microne in width?

A. Yes sir.

Q. They are frequently found hanging together in pairs?

A. Yes sir. My measurements would make them a little longer than that, five-tenths to two, a half micron to two microns long, about two microns in width, that would be one fifty-thousandth of an inch to one twelve-thousandth of an inch in length and about one fifty-thousandth of an inch in width.

1547 Q. In ordinary measurements it seems trifling yet comparatively it makes considerable difference in the size of the microbes, does it not?

A. Yes sir, the species of prodigiosus differ from one another like the sizes of men differ from one another.

Q. It was a healthy growth you had?

A. It was a good vigorous fellow.

Q. Did you state in your examination in chief the distance between Chicago and the St. Louis intake by way of the Drainage Canal, the Desplaines, Illinois and Mississippi rivers?

A. Yes sir, I did. I can get those figures, I think it is 357 miles from the lake.

Q. That is the figure I remember.

A. Yes, I have it right here, from Lake Michigan to the Intake tower generally speaking by river, the distance from the Intake Tower of the St. Louis waterworks to Lake Michigan where the Chicago river now has its source, but used to empty three hundred and fifty-seven miles.

Q. I believe you stated in your examination of yesterday or the day before that the probabilities of contamination by reason of the presence of the typhoid bacillus would be
1548 greater the nearer the place of the introduction of the bacteria to the place of the consumption of water?

A. No, I do not think I made any such statement, as that.

Q. It that true?

A. That would depend entirely on the quantity and the two sources.

Q. I assume other conditions being equal.

A. Yes sir.

Q. The nearer you would be to the consumer the more likely would be the bacteria to be carried?

A. Yes, if you had one hundred men with typhoid fever discharging sewage into the river at the mouth of the Illinois river, at Grafton, the danger to St. Louis would be much greater than if one hundred men were discharging their typhoid fever discharges into the Illinois river at Lockport from the Drainage Canal.

Q. That is what I desired to bring out. Pursuing that suggestion further, suppose that there should have been twenty persons who died of typhoid fever within, we will say, the year 1900 or 1901 or 1902—yes.

And that there was a corresponding number of persons in the same vicinity in the village who recovered from 1549 the disease and the dejecta of all persons, those who died and those who lived, were deposited in the Illinois river say at the mouth of the Illinois river at Grafton, what would you say as to the probability of such a deposit producing typhoid fever in St. Louis?

A. It comes within—it is probable that if the micro-organisms were carried into the Intake from people sick of the disease that a person in St. Louis drinking the water or taking the bacillus into their intestinal canal would contract the disease provided they had not been immunized.

Q. Would it not be a dangerous proximity for so many cases of typhoid patients whose dejecta might be thrown into the river so near the Intake?

A. That would be forty people in a whole year, that would be four people a day constantly discharging their dejecta into the stream during the whole year?

Q. Yes.

A. There is a possibility of such bacteria being carried into the St. Louis Intake and producing disease in St. Louis.

Q. Would not there be more than a possibility, would it not be a dangerous proximity for so many typhoid fever patients whose dejecta were carried into the river?

1550 A. Only four in a day, the total number discharged from them that would go into the river would be relatively small and the dilution would be very great.

Q. Are not the microbes in the human dejecta very great?

A. Yes sir.

Q. What are the facts in regard to that as a quantitative statement?

A. I gave you a statement in regard to the number discovered in urine for instance, we find that one man, Mark Richardson, found one hundred and seventy million typhoid bacilli to the cubic centimeter in the urine of a typhoid fever patient. I suppose that would be a small number compared with the number found in the feces discharged from a typhoid fever patient.

Q. Now, suppose that four persons were afflicted at the same time and the urine and dejecta were deposited in the Missouri river within thirty miles of this city would not that be a sufficient number to create and probably cause at least, disease germs to appear in the St. Louis Intake?

A. The number that would reach the consumer would be extremely small from these four people, from the daily discharge
of four people into the Mississippi river, which we saw
1551 in a low river stage discharges something like twenty-
four thousand cubic feet a second so the separation of the bacteria which would be discharged by four patients into that volume of water would be very wide apart and it is possible that some of them might be carried into the Intake Tower and through it into the distribution system of the city to susceptible individuals, but the danger would not be very great.

Q. Take the city of Alton, 25 miles from St. Louis—

A. Yes sir.

Q. Suppose there were say four people a day, 48 cases in a year of typhoid fever, twenty of whom died with the disease, all of whom deposited urine and dejecta into the Mississippi river, what would you say would be the danger to St. Louis from the near proximity of cases of that kind?

A. We saw that the dejecta of each one of the inhabitants of Alton when discharged and mixed with the waters of the Mississippi river passing that point would be one to 70,000 and we—that we trace very little evidence of the sewage of Alton at Hartford seven miles below, bacteriologically, and consequently it would be again a very remote possibility of having bacteria coming from those patients into the Intake.

1552 Q. If you were afflicted with a typhoid epidemic in St. Louis where as many as two hundred persons were dying in a year during the recent years and you could not trace the cause to any other source than one which you have imagined, might be in existence at Alton, would not that sufficiently account for any trouble?

A. No, I think not sir. Two hundred deaths would mean three thousand cases at least of typhoid fever in the city and that is a great many sick at the same time out of a population of 675,000 to 700,000 with 90 per cent of the bacteria removed by the reservoirs to those who consumed the water. It would take a much larger infection than four people could produce even if above the Intake.

Q. Would you say that you would not regard that as worthy of consideration?

A. It is worthy of consideration.

Q. It is a factor to be considered?

A. Yes sir, it is a factor to be considered in this connection, in trying to trace the source of a typhoid epidemic every fact must be brought to light.

Q. Take the city of St. Charles, how far is it from here?

A. I really do not know, I believe by river it is something like 50 miles. 1553

Q. How far from St. Charles to the Intake?

A. About fifty miles.

ATTORNEY-GENERAL CROW: I think it is 60 or 65 miles.

THE WITNESS: I do not know, I have been there, it is under the actual distance, I know.

JUDGE SPRINGER: Q. Suppose there were as many as 18 or 20 cases a year in that city, I mean that many deaths from typhoid fever in a year and a corresponding number of patients who survived, all of whom deposited their discharges, both liquid and solid into the Mississippi river, would not there be danger from that source?

A. How many patients?

Q. Suppose twenty during the year?

A. Died?

Q. Yes, and the corresponding number, which would be one hundred—

A. It would be larger than that, two hundred—

Q. Who survived?

A. Yes sir.

Q. And all of whom deposited their urine and excreta into the Missouri river from the sewers of that town, would 1554 not that be a menace to the health of St. Louis?

A. Here again we have to take into the consideration the question of dilution. We find there would be seventeen people sick a month with the disease and that would not leave more than a certain number a day, it would be less than one a day, discharging feces, if we have 360 days and 200 people say one a day were discharging feces into the river with the death rate which you enumerated, that would be the dejecta of one typhoid patient in to 79,000 cubic feet of water per second in the Missouri river, at low water stage, so there again you have the remote possibility of the bacteria from one case a day or two cases a day reaching the Intake of the St. Louis water supply.

Q. There is no doubt but the typhoid bacillus would survive in that volume?

A. Easy.

Q. You stated a few minutes ago what would be the probable number that would be discharged into the sewers from even one patient in a day?

A. Yes sir.

Q. It would run up—

A. It would run up in very high figures, we would be dealing with trillions again.

Q. That would be some cause for alarm?

A. It is a factor.

Q. It is a factor to be taken into consideration?

1555 A. It is a factor, yes sir.

Q. Suppose you were looking for causes, suppose you were trying to trace the causes of the present condition in St. Louis of typhoid cases and deaths and you could not find any evidence anywhere else in nature then the fact that at St. Charles there were one or two patients who were sick with typhoid fever and were discharging their dejecta into the river, would not that furnish you some clew to a solution of your problem?

A. Yes sir, if there were no other cases anywhere except there.

Q. If you could not find any others you could attribute it to that?

A. Some of them to that one source, we would have to look for other sources.

Q. If a lively colony should happen to keep together and float into the intake you might get several millions into the waterworks from that source?

A. And ninety per cent taken out by the reservoirs before they got to the consumer so it would leave a few to be distributed throughout the city.

1556 Q. Of course, if there were a greater number of people should happen to be sick of typhoid fever at one particular time, making the average as we have stated, but if there should be eight or ten cases in existence at one time that would largely increase the probability of contamination here, would it not

A. Yes sir, provided there were no other source.

Q. Provided you could not account for it in any other direction. Have not most of the typhoid epidemics originated from a very small cause?

A. That small cause is the typhoid bacillus.

Q. One patient was the cause in Lausanne in Switzerland and the other was a case where the bucket slopped over?

A. That was in Catterham where the bucket with feces was constantly going up all day long.

Q. A little drainage from a bucket?

A. Yes sir.

Q. In Plymouth where the dejecta of an individual was washed into a reservoir after it remained there during the whole winter?

A. Yes sir.

Q. In that case there were 1,100 cases produced?

A. Yes sir.

1557 Q. And 114 deaths?

A. Yes sir.

Q. And all traced to that one individual?

A. Yes sir.

Q. So that when the dejecta of an individual is placed in proximity to the water supply it may cause a great deal of trouble?

A. Yes, sir, may affect all the water supply.

Q. Were you asked the question whether the typhoid bacillus existed, lived a longer time in turbid water?

A. That was asked by Mr. Drennan.

RE-DIRECT EXAMINATION

By Attorney General Crow.

Q. Now. Dr. Ravold, in the cross-examination of General Hamlin yesterday he persisted in using the term disappearance, asking the question as to whether or not the increased volume of water by the opening of the Chicago Drainage Canal and pouring the Lake Michigan waters into the same thereby causing dilution, would tend to increase the dilution in the Desplaines River and consequently the disappearance of bacteria of any kind that might be in the water of the Desplaines or Illinois Rivers, and I want to ask you to explain what you meant 1558 by the term disappearance as used in reply to his question?

A. I meant by this that the bacteria were not killed, that they were not destroyed by the dilution but that they were moved farther apart. I said at the time that if we had a gallon of water with 100 bacteria in it and added 99 gallons to it, we would have at first 100 to one gallon and by adding 99 to it it would be diluted one to 100 and there would be one bacillus to one gallon of water, the bacilli have not disappeared but they are farther apart.

Q. State whether or not dilution would in any way destroy pathogenic germs?

A. No, it does not destroy them.

Q. I will ask you this question, do you consider as a bacteriologist, from your knowledge of the water supply of the St. Louis prior to the opening of the Chicago Canal, and your knowledge of said supply since the time of the opening thereof, that the water supply at the intake tower of this city has been rendered less wholesome and safe for domestic and primary use than before the opening of the canal and if so is it occasioned by the waters from the canal?

A. I think it is less wholesome and I can prove it chemically and bacteriologically. Do you wish the reasons?

1559 Q. You can state them if you want to.

A. Formerly the sewage of Chicago, before the opening of the Chicago Drainage Canal was discharged into what was practically a large tank and that was the Chicago River, a river which discharged itself when the lake was lower than the water in the river or when freshets occurred which swept the water of the river out into the lake, which occurred semi-occasionally; but as a rule the water was stagnant in the river containing the sewage. That stagnant sewage putrified, was broken up by aearobic and finally by anaerobic action until the whole river was a fetid stinking mass. It remained in that river for quite a length of time. In order to purify the river and to create a current in it, pumps were put in at Bridgeport and the sewage pumped into the Illinois and Michigan canal in certain quantitie; a certain quantity was lifted from the South Fork into the Illinois and Michigan Canal. This sewage practically received the treatment afforded by a septic tank and all the pathogenic bacteria were practically dead in it before they reached Bridgeport because the pumps at Bridgeport made no perceptible current in the Chicago River towards the pumps. I tried this experiment several times myself by throwing a board into the river and watching it for several days and it never moved more than
a block either way in 24 hours, so the current towards the
1560 pumps was very small according to my actual experience,
so in my opinion the putrifying material in the river would destroy any pathogenic bacteria such as typhoid left in it for any length of time, or for a short time. Now, however, this condition does not obtain and the typhoid bacteria and other pathogenic bacteria discharged into the stream are hurried through it. In the Chicago River now the rate of flow is something like three miles an hour, sometimes more than that. In August or September, of 1901, Mr. Randolph and I watched a boat trying to get by a bridge, and the boat had not

enough power to force itself up the river towards the lake in a current then running fully three miles an hour. That was at five o'clock in the evening when the gates were lowered at Lockport and the full quantity 300,000 cubic feet was being discharged. The sewage is now carried from the Chicago river into the Drainage Canal and from there on to Lockport and then into the Desplaines and Illinois Rivers so that the chances of pathogenic bacteria vitalized and strong as they come from the bowels of an individual being carried down to St. Louis water supply is infinitely greater now than when the pumps were at work.

Q. I will get you to state if you are acquainted with the 1561 condition of the Illinois and Michigan Canal, as to whether there is any flow of current in this canal?

A. There is a current in that canal.

Q. Is it rapid or slow?

A. Slow, slow at all the periods when I saw it. There may be periods when it is rapid but I never saw one of those periods.

Q. Now, in answer to a question of Gen. Hamlin yesterday you stated that it might be that typhoid bacilli traveling from the sewage of Chicago by the canal, the Desplaines Illinois and Mississippi rivers and coming into the intake here of the Water Works of St. Louis, would be, perhaps, less virulent in form than if they traveled a distance of 10 or 15 miles and then came into the intake, I will get you to state whether or not, if they were still alive that would prevent them from causing typhoid fever?

A. No, sir.

Q. In taking them into the bowels?

A. No, sir. To an equally susceptible individual the chances of a nearby bacillus having greater vitality are greater so that the disease produced in an equally susceptible individual, the disease produced by a nearby typhoid bacillus would be 1562 of more severe type than that produced by bacilli carried some distance.

Q. But each would produce the typhoid disease?

A. Yes, sir.

Q. In an equally susceptible individual?

A. Yes, sir.

Q. But one would be of a milder form?

A. But one would be of milder form.

Q. Now, I will get you to state if there is any difference medically or bacteriologically from your knowledge as to the virulency of a typhoid disease conveyed in a germ of bacteria that comes from a man sick from a mild form of typhoid and one sick with a virulent disease of typhoid?

A. No, in passing through the individual their virulency is greatly increased. Bacteriologically that is a thing which is done every day. In order to increase the virulency of a micro-organism it is put into the blood of a susceptible animal and its virulency can be greatly increased in that way.

Q. That would be the effect on a person taking into the system a typhoid bacillus from one sick with mild form of that disease as to whether he would have a mild or severe form?

A. He would have a severe form if bacteria were to be
1563 put into a susceptible individual, coming from a mild case
or severe case it would not matter very much, the virulency would be heightened by the transit through the individual.

Q. Provided they were equally susceptible in both cases?

A. Yes, sir.

Q. General Hamlin asked you a question yesterday if it was not fact that the recorded cases showed 50 miles or less as the distance that bacilli traved through water and produce disease. I will ask you to show why the records show that to be more or less the fact?

A. Because of the difficulty of tracing the micro-organism under the complex conditions of modern life. If it were an open river in which the typhoid bacillus were under consideration the possibility of the river being affected from cases on its banks or other extraneous sources must be weighed, so that to trace an epidemic more than 50 miles is an extremely difficult thing to do except under such conditions as that of the St. Clair Lake, Detroit epidemic. If the river were covered with a tunnel or running through a tunnel such as the Croton Aqueduct, for a number of miles, then we could say absolutely—For if a typhoid epidemic were to occur in New York, we would feel perfectly confident that no extraneous case of sewage discharge came into

1564 the tunnel from any other source than where the aqueduct opened on the water shed. In the Detroit case we had a remarkable instance, here we had a bed of sewage in a river which had laid there for years and it was suddenly disturbed by dredging and was carried across a lake. It was practically as if in a tunnel, because the sides of the lake were so far away that the one or more cases which might have discharged feces on the periphery of the lake could have no effect. If the material had been carried straight away in a tunnel it could not have been carried more directly to Detroit than it was. That this was the cause of the outbreak of typhoid fever in Detroit Professor Williams has declared on and so reported.

Q. I will get you to state whether sand filtration or any other filtration is a full preventitive of typhoid fever?

A. Only relative.

Q. The effect is to minimize the danger, reduce the number of cases?

A. Greatly minimize the danger.

Q. Is there any reason for believing that typhoid bacilli exist a long time in moist earth?

A. Yes, sir.

1565 Q. What is it?

A. A number of experiments have shown that this is so. Experiments by Firth and Horniks show that these micro-organisms live a long time in earth and sand that is moist and retain their virulency.

Q. Do you remember the length of time?

A. Twenty-five days in dry earth and longer than that in moist earth. They carried out a series of experiments and were able to capture the typhoid bacillus in the dust stirred up in them in blowing across the infected earth.

Q. Dry earth?

A. Yes, sir.

Q. Did they make any experiments in moist earth?

A. Yes, sir, the longevity was much greater.

Q. Do you remember the time?

A. Several months ago, in 1902. I do not remember exactly the date.

Q. From your knowledge of bacteriology and your experiments I will get you to state whether there is great probability of this being a fact that typhoid germs, bacilli, are carried down in the mud and filth of a lake and river and under conditions that they may exist for a long time there, and retain their virulency and spread disease, they being swept out by floods or dredging?

1566 A. I tried to carry out some experiments on that point but found it a very difficult thing to do, but basing conclusion on dredging, such as that at Detroit, it would seem that typhoid bacilli will retain their vitality a great number of days in the sludge that exists in the bottom of a river or mouth of a river.

Q. What is the one thing aside from the aesthetic standpoint that renders sewage and polluted waters a warning against the use of the same from a medical, bacteriological and chemical standpoint?

A. It is the evidence of sewage pollution.

Q. The evidence of it but what is the one thing in sewage polluted water or connected with sewage polluted water that warns the sanitarian that it is not fit to use?

A. It is the pathogenic germs.

Q. I will get you to state as a bacteriologist, if there is an established connection between sewage and pathogenic germs that convey disease?

A. Yes sir, where sewage is found in a stream it is presumed that pathogenic bacteria may be there also because sewage polluted water contains the discharges of human beings and if there be typhoid or other diseases among them like diseases will follow in those drinking the water.

1567 Q. Aside from the repulsiveness of drinking sewage that comes from aesthetic reasons the real danger in sewage comes from the germs?

A. Yes, sir.

Q. Aside from the finding of bacteria that usually accompany sewage the ordinary scientific test of whether water contains sewage pollution is a chemical test?

A. Yes, sir.

Q. That is used in connection with the bacteriological test to determine the potability of water?

A. Yes, sir, there are three tests, the microscopic examination, the bacteriological examination and the chemical examination, they must be combined.

Q. It takes the three to determine the potability of a water supply?

A. Yes, sir.

Q. Do you know how many times in the history of typhoid bacilli it has been found in running waters?

A. Authentically probably a hundred times.

Q. In all the history of the world?

A. Yes, sir.

Q. You mean the germ itself?

A. The germ itself.

Q. The waters of the whole earth have been searched bacteriologically for the typhoid bacillus?

1568 A. Yes, sir.

Q. By a great number of men?

A. Yes, by bacteriologists working all over the earth.

Q. And it is now going on?

A. Yes, sir.

Q. It is not an inhabitant of salt water?

A. Yes, sir.

Q. It can live there?

A. It can live quite a long time in salt water.

Q. You mentioned yesterday the fact that the German Government prohibited the use of water failing to stand a certain bacteriological test, what is that?

A. They have what they speak of as pure water, what they speak of as pure, containing not more than one hundred bacteria to the cubic centimeter, water containing more than five hundred to the cubic centimeter is not considered potable water.

Q. That is without reference to the character of the bacteria?

A. Yes, sir, all waters coming from a filter must not contain more than one hundred bacilli to the cubic centimeter.

Q. General Hamlin asked you a question yesterday, if you knew of any water outside of the waters of boiling springs
1569 that were absolutely free of some kind of bacteria and your answer was you did not. I will get you to state if

there are any waters that are pure from a sanitary standpoint?

A. Yes, spring waters from an upland source.

Q. Are you acquainted with the history of the bacteriology of the waters of the Great Lakes in the Dismal Swamp?

A. No, sir.

Q. As a bacteriologist and hygienist I will ask you if you consider it safe for the citizens of any city to sewer into running streams the waters of which are used for primary and domestic purposes by those below?

A. I think it is a dangerous thing to do to use that water.

BY JUDGE SPRINGER: Q. Without a filter?

A. Yes, sir, discharging sewage in that way is a reprehensible practice and drinking the water is a dangerous experiment.

ATTORNEY GENERAL CROW: Are you familiar with the history of the work of the English Rivers Pollution Commission?

A. Yes, sir, I have read the work of the English River Pollution Commission.

Q. When was that commission organized?

1570 A. I think it worked eight years.

Q. What period of time?

A. I have forgotten the dates.

Q. Recently?

A. Compratively recently, several years ago it ceased.

Q. Do you know what was the result of their examinations as to the effect of sewage on running streams?

A. As I remember the conclusions they were something like this, that the evidence is overwhelming that sewage polluted waters are dangerous to drink and that no river in England is long enough to purify itself of sewage, consequently of pathogenic bacteria even if put in at its source.

Q. Did you find in the waters of the Illinois, Desplaines and Mississippi rivers coli communis in greater numbers in a flood stage than in ordinary seasons?

A. In flood stages the percentage was less than in low waters.

Q. In flood seasons the general forms of bacteria are found in greater numbers in the waters of rivers?

A. Yes, sir.

Q. The general bacteria are found in greater quantities in flood seasons in all streams?

A. Yes, sir.

Q. You said the Lausanne bacteria went through a solid
1571 mountain?

A. Yes, sir.

Q. What was the distance of solid earth it passed through to reach the water polluted?

A. Looking back on it I should say it was at least a mile through the mountain, coming down through the rocks a mile.

Q. They afterwards verified that by a salt solution?

A. By putting salt into the water and finding chlorine in the well below at the foot of the mountain.

Q. Is there any extended epidemic of typhoid recorded in the books that has been caused by any other fact than a polluted water supply?

A. No, the classical cases were all for a short period and ran their course and disappeared.

Q. Do you know whether or not there was any dredging going on in the Illinois river in the autumn of 1899?

A. I do not. I saw the dredges at work there in 1901 below Kampsville.

Q. What was the stage of the Desplaines and Illinois and Mississippi Rivers when you made the experiment with the bacillus prodigiosus in 1901?

A. The river was very low, lower than it had been for
1572 years.

Q. What was the effect of the low water stage on the current of the rivers?

A. The current was slow, retarded very greatly.

Q. Now, have you got any statistics of the typhoid death rate in the City of Chicago?

A. I have some statistics that were published by Dr. Jorden. I suppose they were compiled from the Health Department statistics, personally I have not secured statistics of that character.

Q. I will ask you if you have examined the statistics of typhoid fever in the City of Chicago?

A. I have in that article.

Q. How does the typhoid death rate, the number of deaths, compare in the City of Chicago with similar cities of a similar size in this and other countries, is it greater or less?

A. Greater, very high.

Q. Do you remember when it was, what year, that the greatest typhoid epidemic occurred in the City of Chicago?

A. The typhoid fever in Chicago, the highest death rate that I see in here was in 1891.

Q. What was the number of deaths?

1573 A. 1997.

Q. What was the population of the city at that time according to the census of 1890?

A. The population was 1,148,710.

Q. What was the death rate, the number of deaths, in 1892?

A. In 1892 there were 1,489 deaths.

Q. What was it in 1893?

A. In 1893 the water was taken from the four mile crib 670 deaths.

Q. What crib was it taken from prior to that?

A. Small cribs not very far out.

Q. Adjacent to the lake front?

A. Yes sir. That has been credited to Dr. Reynolds, had it not, the four mile crib put out in 1892?

Q. That is five miles.

MR. TODD: It was completed about six years ago, five years ago.

THE WITNESS: In 1893 670 deaths.

ATTORNEY GENERAL CROW: Q. Prior to this time do you know where the water cribs were located whence the
1574 supply was taken, have you any knowledge?

A. I have seen them, I really know but little about the geographical position of the cribs.

Q. What was the number of deaths in 1894?

A. Four hundred and ninety-one.

Q. What was it in 1895?

A. 518.

Q. What was it in 1896?

A. 751.

Q. What was it in 1897?

A. 437.

Q. What was it in 1898?

A. 636.

Q. What was it in the next year, 1899?

A. 442.

Q. What was it in 1900?

A. 337.

Q. What was it in 1901?

A. 509.

Q. What was it for the first 10 months in 1902?

A. 597.

1575 Q. The last two months not given?

A. Not given.

Q. Taking those statistics as being correct, as being reported by the health authorities of the City of Chicago, has the typhoid rate increased or decreased in Chicago since the opening of the Drainage Canal?

A. If we would take the Drainage Canal as opened in 1900—

Q. Take the entire period?

A. In that year there were recorded 337 deaths from typhoid; in 1901 there are recorded 509 deaths from typhoid and in the first ten months of 1902, 597 deaths from typhoid. That is a steady increase.

Q. What is the number of cases to the death recognized as a fair standard by the medical fraternity and health authorities of this country?

A. In hospitals cases about one in ten die; in household or home treatment of the disease on an average about one in fifteen.

Q. To what is ascribed the difference in mortality rate between the hospitals and homes?

A. In the cases taken to the hospitals generally the disease has advanced and the patient is bedridden, then he is taken

to a hospital very sick, and as a rule this applies to people
1576 of the poorer classes who exhaust their money in improperly caring for themselves the first week or two of the disease and then must be sent to a hospital where they arrive generally very sick and exhausted with the disease so that when the physician in the hospital sees the case it is more severe and has progressed further than when a family physician is called to a patient sick with the disease.

Q. Have you the typhoid death rate there for the first ten months of 1902?

A. Yes, sir, for January 1902, 21 deaths; February 14 deaths; March 20 deaths; April 16 deaths; May 24 deaths; June 22 deaths; July 44 deaths; August 193 deaths; September 165 deaths; and October 78 deaths are reported.

Q. That is the last of the months?

A. Yes, sir.

Q. Do you know whether or not as a rule in cities in the home treatment the dejecta and urine of typhoid patients are treated so that the germs are rendered not dangerous before they are put into the sewage?

A. I know it is very illy performed. I had a typhoid case in my own home, and I think I know something about
1577 disinfection yet in spite of the most rigorous precaution and rules laid down as to how to treat the dejecta of the patient half of the time they were thrown into the closet not disinfected.

Q. In your practice as a physician in this city would it lead you to believe as a rule that is the case?

A. Yes, sir.

Q. That they are not disinfected?

A. Yes, sir, it is much cheaper to empty the discharges from typhoid into the closet than it is to disinfect them, it is expensive to properly disinfect dejecta with chemicals and takes time. The vessel containing the discharges mixed with disinfectants must be covered and kept an hour, which militates against proper disinfection. In hospitals better results can be obtained because the staff of nurses are as a rule well trained in disinfection processes.

Q. There was a map you said you would make and have not made?

A. No, my eyes have been in too bad condition to take hold of the figures that Mr. Randolph gave me.

Q. I will get you to state whether the death rate or number of cases reported is taken as the standard in the sanitary or medical world as an index of the prevalence of typhoid fever?

A. The deaths only.

1578 Q. Why is that?

A. Because physicians do not report the cases, there is no penalty for not doing it, it is looked on as a courtesy, to the Health Department only. Physicians do it if they feel like it.

Q. Is there not walking typhoid?

A. Yes, sir, there are cases that do not get into the death list. Deaths physicians are compelled to report and the death rate is the only thing.

RE-CROSS-EXAMINATION

By Mr. Springer.

Q. You spoke about the sewage in the Chicago River which was pumped into the Illinois and Michigan Canal having been in the condition of sewage preserved in a septic tank?

A. Yes, sir.

Q. In your opinion the pathogenic germs had been destroyed?

A. Yes, sir.

Q. Upon what do you base that opinion?

A. On experiments, personal experiments.

Q. What kind of experiments?

A. To ascertain what occurred to bacteria such as the typhoid bacillus in the presence of anaerobic germs such as exist in a septic tank. It has been found that a septic tank as I have said before, acts in this way, that the aerobic bacteria first use up the oxygen of the air that is in the water, they take out 1579 that oxygen, and that gives the micro-organisms which exist only in the absence of oxygen a chance to begin their activity. These micro-organisms break up the organic compounds and liquify them very rapidly, and the result of the activity on the organic compounds is to produce large quantities of toxins and gases, carbon, dioxide, methane, N. H. 4, march gas, hydrogen and nitrogen and these concentrated poisons are spread throughout the septic tank in which the water is stagnant, standing still, the typhoid bacillus, although motile, cannot get away from its surroundings, no matter where it moves in this putrid field it still comes in contact with the toxins which are deleterious to its activity and destroy it.

Q. Did you make any bacteriological examination of the water in the Chicago River before the opening of the sanitary canal and at the time that the water was being pumped into the Illinois and Michigan Canal?

A. I did not.

Q. Your conclusions, then ,are based upon your knowledge of other matters in conditions which you regarded as somewhat similar?

A. Yes, sir.

Q. Was there not injected into the Chicago River daily
1580 during the time the water was pumped into the Illinois
and Michigan Canal the dejecta of typhoid patients from the city if there were any?

A. Yes, sir.

Q. Would not those pathogenic germs in the water be in a condition to be pumped into the Illinois and Michigan Canal?

A. If they got out that far.

Q. The sewers emptied all along the line?

A. Yes, sir, as I told you the current was not remarkable for the speed with which it moved towards the pumps.

Q. There were a great number of those germs put into the river at various places and they would permeate the whole lot?

A. Yes, sir, if they lived.

Q. Some of them would get into the Illinois and Michigan Canal?

A. A small number, possibly.

Q. Do you know how much water was pumped into the Illinois and Michigan Canal?

A. I have the figures.

Q. A large amount, was it not?

A. Something like 60,000 cubic feet a second or minute, I have forgotten the quantity, 60,000 a minute and now the Drainage Canal discharges 300,000 a minute.

Q. That went into the Illinois and Michigan Canal?

1581 A. Yes, sir.

Q. Would that canal have an outlet towards Joliet?

A. Yes, sir, at Lockport.

Q. Into what river?

A. The Desplaines.

Q. How is the control of that water managed?

A. Engineer Randolph showed me the water discharging through the turbines of mills that were alongside of the canal at Lockport, so it seemed to me that most of it went out that way, but some of it was carried on towards Joliet and on to La Salle.

Q. Did the Illinois and Michigan Canal act in any way as a sedimentation basin?

A. Yes, and tank, a septic tank.

Q. Does not the same condition exist with reference to the sanitary canal at this time?

A. O, no.

Q. Does it not act as a sedimentation basin?

A. Yes, but it is not a septic tank, I spoke of the Illinois and Michigan Canal being a sedimentation basin and septic tank.

Q. How long would sewage be required to remain in one place in order to reach the condition of what you call a septic tank?

A. A very few days, ten days.

1582 Q. During that time it becomes broken up?

A. Yes, sir, liquified and smells to heaven.

Q. Do you know what the current was in the Illinois and Michigan Canal?

A. When I saw it at one time it was covered with ice, and I thought there was no current whatever, there did not seem to be much discharge from it in the winter time, I do not know whether water was pumped into it in the winter time. Once I rode alongside of it in the Chicago and Alton train going into Chicago and at another stood on its banks and watched the current. It was very slow.

Q. What is the current in the Drainage Canal, if you know?

A. I do not know from personal experience. The velocity of flow will be given to you later. A stick thrown into the stream, if the canal police will let you do it, is taken along pretty rapidly. It depends on the height of Bear Trap Dam, the quantity of water flowing over the dam in the afternoon is quite large, making a rapid current in the Chicago River.

Q. I believe you stated that the dilution of the water in streams has a very material effect of lessening the chances of conveying germs to the place of consumption?

1583 A. Yes, sir, it moves the bacteria further apart, it does not destroy their vitality.

Q. The chances are reduced?

A. Yes, sir, the chances of an individual taking one of them in drinking a definite quantity of water.

Q. Have you estimated the effect on the waters of the Mississippi Rivers at St. Louis after taking in the sewage of the city and the suburban population, as to what effect it has on the cities down below?

A. No, I have not.

Q. Would not the same conditions prevail in reference to the cities south of here?

A. Yes, sir, if they were to take water from the river.

Q. How far down the river would this probably extend?

A. As far as the bacteria would retain their vitality and that is in this water from 15 to 30 days. They would be carried a long distance in that time with a swift flowing river.

Q. It is very swift here?

A. Yes, sir.

Q. Whose article is that you were reading from in reference to the death rate of typhoid fever in Chicago? 1584

A. Typhoid fever and Water Supply of Chicago by Edward Oakes Jordan, Associated Professor of Bacteriology, University of Chicago, Chicago, an article published in the American Journal of December 30th 1902.

RE-DIRECT-EXAMINATION

By Attorney General Crow.

Q. The condition of a septic tank in a stream or body of water can only obtain where the matter is not subject to any motion?

A. No, where it is stagnant water.

Q. In a lake where it is swept by the action of waves or in a stream moved by a current, open at either end, the condition of a septic tank cannot exist?

A. No, it means freedom from motion.

JUDGE SPRINGER: The Chicago River does not meet the conditions of a septic tank?

A. Now?

Q. Before?

A. Yes, it did before, in some portion of it, the portion on the South Fork looked like a boiling cauldron.

1585 ATTORNEY GENERAL CROW: That was not true in reference to all of the river?

A. No, not where the pumps were.

Q. Away from where the pumps were?

A. Towards the lake, near the pump it looked like a boiling cauldron owing to the action of the anaerobic bacteria in the bottom of the river and it smelled to Heaven.

MR. TODD: In proportion that the typhoid diminishes in Chicago the less danger there would be to the cities along the canal and the Illinois river and tributaries from typhoid fever?

A. Typhoid infection, yes sir.

AMAND N. RAVOLD.

1586 CHARLES LEWIS STEVENSON

being duly sworn on the part of the complainant, testifies as follows:

DIRECT-EXAMINATION

By Mr. Woerner.

Q. State your full name?

A. Charles Lewis Stevenson.

Q. Where do you live?

A. 2845 Clark Avenue City of St. Louis.

Q. How long have you lived in St. Louis?

A. Between 14 and 15 years.

Q. What is your business?

A. I am a traveling man at the present time.

Q. Were you ever employed by the St. Louis Water Department?

A. Yes, sir.

Q. When?

A. In March of 1901, first up until about the first day of April and then later, I think the 20th day of November, 1901, and from that up to the 15th, about the 15th of December.

Q. Of the same year?

1587 Q. What were your duties, what did you do?

A. My duties were to go out and take water, collect water samples. In March I collected one every hour during the day, twelve hours.

Q. Where was that?

A. That was at LaSalle, Illinois, four days, at Beardstown, Illinois, four days and the rest of the time at Grafton.

Q. Then, in the fall during what period?

A. From November 20th I think, if I had my book I could state exactly, I didn't know I was going on the stand, I think from November 15th to the 15th of December, at the Intake Tower at night.

Q. During the night you say?

A. Yes, sir.

Q. How often did you collect samples?

A. Every two hours.

Q. How did you collect them?

A. I crawled down a ladder about 60 feet to the water and collected with one of the machines over there, the small one (referring to an apparatus in the room).

Q. By the machine you mean one of the appliances in which a bottle is fastened?

1588 A. Yes, sir, the small one, Plaintiff's Exhibit No. 15, that sized bottle. I collected them that deep under water.

Q. The entire length of the instrument under water?

A. The entire length of the instrument under water.

Q. That is about three feet, is it?

A. Yes, sir.

Q. What portion of the tower did you get the water from?

A. I got the most of it on the east side of the intake, right down at the tower on the east side near the intake.

Q. Was that where the water was going in into the intake?

A. Yes, sir, it goes in the east side.

Q. You did not collect during the day, I suppose?

A. No, sir.

Q. You say you collected samples every hour?

A. Every two hours were my instructions.

Q. What did you do with them?

A. I closed them with tinfoil and a cloth and the next morning as early as I could possibly get down town I took them to the office.

Q. What office?

A. The City Chemist's office.

Q. You tagged the bottles?

1589 A. I tagged the bottles.

Q. What did you put on the tag?

A . I put on the date, the place, the time of collection and those that were taken there, the air and water was not taken.

Q. Put your name on it?

A. My name.

Q. Anything else?

A. Nothing else.

Q. You did that in each case?

A. In each case.

Q. During the period you have stated, during the fall and winter of the year?

A. Yes, sir, the last of November and the first days in December, 1901.

Q. You collected the specimens in the bottle beneath the surface?

A. Beneath the surface.

Q. Did the appliance permit you to lift out the glass stopper when it was beneath the surface?

A. Yes, sir.

Q. It was also closed when it was beneath the surface as soon as it was full?

A. Yes, sir.

CHARLES LEWIS STEVENSON.

1590 ADJOURNED until Friday, March 13, 1903, at 10:00 A. M.

1591 SOUTHERN HOTEL,
St. Louis, Missouri,
10 a. m., Friday, March 13, 1903.

Continuation, pursuant to adjournment.

Present: The Commissioner, and same counsel representing the respective parties.

EDWARD H. KEISER,

a witness of lawful age, being duly produced, sworn and examined on the part of the City of St. Louis, testified as follows:

DIRECT EXAMINATION.

By Mr. E. C. Crow.

Q. Please state your name. A. Edward H. Keiser.

Q. What is your occupation? A. I am professor of chemistry in Washington University, St. Louis, Missouri.

Q. How long have you been occupying that position in Washington University? A. Since the fall of 1899.

Q. From what institution did you come to Washington University? A. From Bryn Mawr College, near Philadelphia, Pennsylvania.

Q. How long were you there? A. Fourteen years.

Q. What position did you occupy there? A. Professor of chemistry.

Q. Prior to that time, what was your occupation?

A. I was instructor in chemistry in the Johns Hopkins University at Baltimore.

Q. For how long a time? A. For about eighteen months.

1592 Q. Have you occupied any other position in educational institutions?

A. I was Fellow in chemistry previous to that in Johns Hopkins University in Baltimore for two years.

Q. Where were you educated, professor?

A. I was graduated from Swarthmore College, Pennsylvania, in 1880,—that is, taking the degree of Bachellor of Science in 1880, and I took the degree of Master of Science in 1881 from the same institution. In 1884 I took the degree of Doctor of Philosophy in the Johns Hopkins University, Baltimore, and

I studied in Germany in the summer of 1884, at Freiburg, in Saxony, and in 1887 in Gottingen University, and in 1894 at Heidelberg, in Germany.

Q. Now, in your studies in Germany, what particular branches of education were you pursuing?

A. Chemistry.

Q. The schools to which you went in Germany, are those of recognized quality of excellence?

A. They are. They are the universities in Germany.

Q. Were you ever called upon to make an analysis of the waters of the Mississippi River at the In-take Tower of the St. Louis Water Works, of the Missouri River, and of the Mississippi River above the mouth of the Missouri, the Illinois River, the Des Plaines River, and the Chicago Drainage Canal? A. Yes sir.

Q. For whom did you make that analysis?

A. I was called upon in January, 1900, by the Water 1593 Commissioner of St. Louis and the City Chemist, and was asked to make an examination of these waters.

Q. In your education, did you pay any particular attention to the analysis of water?

A. Yes, I studied that as a student and had a good deal of practice in it as a teacher of chemistry.

Q. Whereabouts?

A. At Bryn Mawr College, and also at Johns Hopkins University, and at the Washington University in St. Louis.

Q. Just tell me what particular amount of experience you had in analyzing waters aside from these tests here?

A. I have every year analyzed waters in every laboratory where I have been. The analysis of water is a frequently occurring operation in a chemical laboratory. It is taught to the students in chemistry and water analyses are constantly made both by the instructors and students.

We are often called upon by individuals to pass judgment upon the character of drinking water, and before doing that we make an analysis of the water so it is a frequently occurring operation. It is one that a chemist is called upon to carry out right along in his practice.

Q. Have you made many examinations of different waters for the purpose of determining their potability?

A. I have made a great many.

Q. Enumerate some of the waters you have examined to determine their potability.

1594 A. I have examined the waters that are supplied to the city of Baltimore—not in an official way, but merely as a chemist in the laboratory for my own information. And I have examined the waters of Philadelphia—the water for our supply at Bryn Mawr College. And then a great many well waters and spring waters have been sent to my laboratory for analysis. And here in St. Louis I have from time to time analyzed the tap water—that is, the hydrant water in the laboratory. Together with a great many other waters that have been sent in. I have analyzed a great many waters for the railroad companies for the purpose of determining the value of these waters and their character.

Q. What railroad companies?

A. I have made several dozen analyses for the Missouri Pacific Railroad Company and the Iron Mountain Route. Every time they sink a new well they generally send a sample to my laboratory to have it tested before they use it on those roads.

Q. Have you ever examined any of the waters of the Northern Lakes, or those adjacent thereto, other than Lake Michigan, in this examination?

A. I have not.

Q. Have you ever examined the waters of any deep wells in the northern part of this country?

A. I have. I have examined some of the waters at Wequetonsing, Michigan. It is a summer resort. There were cases of typhoid fever occurring there in the summer of 1901, and samples of that water were sent to me for analysis.

1595 Q. I will ask you to state, professor, if, in determining the potability of water from chemical analysis, whether or not it is also necessary for the chemist to know something of the local history of the water which he examines?

A. It is very desirable in passing judgment upon the character of the water to know as much as possible about the surroundings of the well or spring from which the water is obtained.

Q. Or the river?

A. Or the river.

Q. And if there is contamination, is it necessary or expedient that the source of the contamination be known and examined? A. It is.

Q. Now what two other branches of science are used in connection with the chemical analysis of water in determining its potability and the propriety and safey of using it for domestic and sanitary purposes?

A. Bacteriology, bacteriological science is used.

Q. Any other?

A. Analytical chemistry.

Q. What about microscopic examination?

A. I include that in bacteriology.

Q. Microscopic examination for the purpose of determining the potability of water—has that any effect on the judgment of the chemist in determining the potability of the supply?

A. It certainly has.

Q. What effect has it?

A. In judging of the character of the water, the analyst is influenced by the number of bacteria found in a cubic centimeter of the water, and also by the character of the bacteria. 1596

Q. Does the flora of the water have anything to do with its potability?

A. That is more a matter for the bacteriologist to determine.

Q. The chemist does not consider that?

A. No, sir, the chemist does not consider that.

Q. Does the chemist consider the coloration of the water?

A. Yes, the chemist notices the color and appearance of the water; and whether there is a sediment there or not; and the odor and taste.

Q. What color indicates that suspicion should be cast upon the water? A. A pure water should be clear and colorless like a crystal, clear as crystal. Any color—a dark color indicates organic matter. A yellow color may be due to vegetable matter or to an earthy sediment in the water. The color is not a sure test, of course.

Q. It is one of the indications?

A. Yes sir, that is one of the indications.

Q. What weight does the chemist give to the brown color of water?

A. Well, brown waters are often regarded as suspicious, the brown color being due to organic matter. It may, however, be of vegetable origin, and then it may not be of a harmful character.

Q. Does the chemist consider the turbidity of the water?

A. Yes, he makes a record of it.

Q. It is one of the indications of the quality of the water?

A. Yes, of the quality of the water.

1597 Q. You stated that you made some examinations and made them for the city of St. Louis?

A. Yes, sir, for the City Chemist, and for the legal department of the city of St. Louis.

Q. Did you personally make these analyses yourself?

A. I was assisted by four assistants, and at times by five assistants, and together we made the analyses.

Q. Was the work done under your personal supervision?

A. Yes.

Q. And inspection?

A. And my inspection.

Q. Then are you able to speak for the accuracy of the work?

A. Yes, sir.

Q. And consider it your own chemical analysis?

A. Yes, sir.

Q. Where was this work performed?

A. In the chemical laboratory of the Washington University.

Q. Where did you receive the samples of water from?

A. I received them from the City Chemist's office. They were delivered to me in the laboratory of the Washington University.

Q. From the City Chemist's office in St. Louis?

A. Yes, sir.

Q. In what condition were these samples when they were received, and in what were they contained?

A. They were contained in glass bottles of one gallon ca-

pacity, and the stoppers were tied over with a cloth, and the cloth was fastened with strings, and the strings were
1598 sealed. And to each bottle was attached a label stating the point on the river where the water was taken or collected, and also the time when the collection had been made, and the name of the collector.

Q. I show you "Plaintiff's Exhibit No. 16," and ask you if that is one of the bottles, or character of the bottles, in which you received the samples?

A. (After examining "Exhibit 16") Yes, these are the bottles.

Q. Capacity one gallon?

A. One gallon.

Q. Were these samples received daily or weekly?

A. We received them daily.

Q. Were they encased in the proper manner that samples should be when transmitted for chemical examination?

A. Yes, sir. The samples that came from a further distance were packed in ice in warm weather.

Q. Is that necessary?

A. It is very desirable in warm weather that they should be packed in ice.

Q. Is there any difference in the results of the chemical analyses of the same water when made at varying temperatures?

A. Water changes very rapidly. The organic matter in water, especially that which we recognize as nitrites, are very apt to undergo a change if the water is kept at ordinary temperature or higher temperatures.

Q. Do you know who delivered these samples to you at your laboratory?

1599 A. I do not remember the names of the men who delivered them.

Q. Do you know with reference to the time you received them how long they had been taken from the waters?

A. Only a few hours, I think.

Q. They had been transmitted directly to you then through the City Chemist's office?

A. Yes, sir.

Q. Were these bottles sealed in any manner?

A. They were.

Q. With what?

A. They were closed with cloth over the stopper, and that was tied down over the neck of the bottle with strings, and the strings were sealed with sealing wax—attached with sealing wax.

Q. Did you find, you or any of your assistants, any of these seals broken on the bottles?

A. I do not remember any of them having been broken.

Q. If they had been found broken, would they have been used as samples?

A. No sir.

Q. Did you have any rule about that?

A. We had direct orders not to make any analyses of any bottles broken, or with seals broken.

Q. And all the analyses you made, or you testify about, were made from bottles that were sealed when they came into your possession? A. Yes.

Q. You are familiar with the proper method of making
1600 analysis of water for the purpose of determining its potability, are you? A. Yes sir.

Q. Will you please describe the methods that you followed in making these chemical analyses of the water which you made for the city of St. Louis?

A. I made eight determinations in the analysis of water. The first of these was a determination of the total solid matter in the water, and secondly, we determined the amount of free ammonia. And thirdly, the amount of albuminoid ammonia; and, fourthly, the total ammonia; and, fifthly, the oxygen consuming properties of the water; and, sixthly, the nitrogen present as nitrates; and, seventhly, the nitrogen present as nitrites; and, eightly, the chlorine.

Q. What was the state of the water you used for these different determinations; was it filtered or unfiltered?

A. For the first five determinations we used the water in an unfiltered state; for the determination of the nitrogen as nitrites and nitrates and of chlorine we used the filtered water.

Q. How was it filtered?

A. We filtered the water through paper filters, perfectly pure, washed, paper filters were used, and these filters had been tested before to make sure they were free from nitrites. A portion of the water was filtered through Pasteur filters. That used for nitrates and chlorine determinations were filtered through Pasteur filters.

1601 Q. You might give a description of the particular method you followed.

A. For the determination of the total solids, a measured volume of the water, 100 cubic centimeters of the water was evaporated down to dryness in a weighed platinum dish and it was heated for about fifteen minutes in an oven to make sure that all water had been driven off, and the residue of this water was weighed—the platinum dish with the residue was weighed. That we call the total solid matter in the water. That solid matter consists of mineral salts and of animal or vegetable matter that may be in the water. The next step was to heat this platinum dish, to heat it over a flame to a dull red heat. This heating burns away all the vegetable or animal matter that was in the water and that remained in the total solid residue. After heating and usually during the process of heating, the residue turns brown; if there is any animal or vegetable matter in the water it is charred and burned away; and after the heating we weigh again and we find now that this residue weighs less than before. We call this loss in weight the volatile and organic matter in the water, and the difference between the weight of the dish after this heating and before gives us the total amount of organic matter in the residue and also the amount of fixed solid matter or mineral matter that is in the water. Then we go on to determine the organic matter in the water that is of a nitrogenous character. We then determine the nitrogenous organic matter and we look for nitrogen in four forms. The chemist looks upon nitrogen as an element that is characteristic of living
1602 things. Nitrogen goes through a cycle of changes in living matter and the presence of nitrogen compounds in water shows that the water has become contaminated with matter of vegetable or animal origin; so that the chemist attaches very great importance to the detection of nitrogen in its various forms

in natural water. A pure water is free from all nitrogen compounds, but such water is never found in nature. All natural waters contain varying amounts of nitrogen in some form. Now the chemist looks for nitrogen in four forms: First, as free ammonia; second, as albuminoid ammonia; third, as nitrites, and, lastly, as nitrates. I might say the cycle of changes through which nitrogen goes is something like this: vegetable matter requires nitrates for its growth and development. The roots of plants take up nitrates from the soil or from water, and the plant builds up complex nitrogenous compounds or albuminoids, such substances as gluten of wheat and similar albuminous substances. These albuminous substances are the foods of animals, and animals live upon these albuminous substances. And in their life processes they break down the complex nitrogenous compounds that plants have built up and break them down to simpler compounds which are not albuminoids, and these products that are eliminated from animal bodies find their way into water and are broken down still further by still lower forms of life, by bacteria. They break down these products eliminated from animal bodies, into still simpler forms of nitrogenous compounds, namely, ammonia and nitrites and by still further action of bacteria the ammonia and nitrites are brought back 1603 again into the nitrates. An then it is in the condition for plants to again absorb it and take it and build up the complex nitrogenous compounds which serve as food for animals. So that nitrogen is going through a cycle of changes. It is being built up into complex compounds and animals live upon these substances and break them down partially, and then they are finally reduced to the nitrates by means of organisms in the soil and water. This is what we call the nitrogen cycle.

Q. And this nitrogen is taken by the soil and used until broken down by the cycle you have described?

A. Yes, sir. And, therefore, a chemist attaches very great importance to the detection of nitrogen compounds in water. If found in water it is evidence that there is nitrogenous organic matter undergoing putrefaction there. And we search for it in the form of free ammonia, albuminoid ammonia, nitrites and nitrates, those four forms. Shall I describe now the method of determining those forms?

Q. Describe the method you pursued in this investigation.

A. In determining free ammonia, a measured quantity of the water, 500 cubic centimeters, was placed in a glass flask that was connected with a condenser, and it was distilled, and the steam that comes off from that water carries with it any free ammonia that may be in the water, and it is condensed and collected in five separate glass vessels.

Q. Which, the steam?

1604 A. The steam is condensed and comes out of the condenser in the form of drops of water and those drops of water contain the drops of free ammonia.

Q. Is that distilled water?

A. Yes, that is distilled water; but contains the ammonia contained in the original samples of water. The five portions collected in that way have then added to them a solution called Nessler's solution. This Nessler's solution is a mixture of potassium iodide, mercurial iodide and caustic potash in definite quantities. Do you wish those proportions?

Q. Yes, give us the proportions you used there in order to see what the test was.

A. The Nessler's solution contained 35 grammes of potassium iodide, and to that was added a saturated solution of mercury iodide until a permanent precipitate was obtained. Then it was made up to 1,000 cubic centimeters with a 10 per cent solution of caustic potash. On adding this Nessler's solution to the five portions of the distillate containing free ammonia, a brownish-yellow color is produced and the strength of the color depends on the amount of ammonia present. We then make up similar colors by means of a standard solution of ammonium-chloride of known strength. We match these colors with the standard ammonium chloride and compare them and thus we determine the amount of ammonia present in the water. The standard solution of ammonium chloride contained 3.8133 grammes of ammonium chloride in the litre of water and for the usual work in the laboratory 10 cubic centimeters of 1605 this solution was taken and diluted to 1 litre for use in making the standard. Then the next step was the determination of albuminoid ammonia. The residue in the flask, consisting of 250 cubic centimeters of the water, was now treated with 40 cubic centimeters of alkaline solution of potassium permanganate, and it was again distilled; and five samples of 50 cubic centimeters each of distillate were collected and these five were again treated with the Nessler's solution and the ammonia that was in them gave the brown color and the amount of the ammonia was again determined by making up similar colors with the standard solution of ammonium chloride and the Nessler's re-agent. In this way the amount of albuminoid ammonia in the water was determined and in the analyses this amount is stated in parts per million, which means a certain number of parts by weight in a million parts of water.

Q. Is that the usual standard in determining the chemical constituents of water—to do it by parts per million?

A. Yes.

Q. Is that the equivalent of milligrammes per million?

A. Yes. Then the next determination was the total ammonia. The total ammonia in our work was determined by adding together the free ammonia found in the first operation described to the albuminoid ammonia found in the second operation. That gave us the total ammonia.

Then the next was the determination of nitrogen as nitrites.

1606 For this a filtered water was used. 100 cubic centimeters was placed in a clear glass cylinder and 2 cubic centimeters of a solution of sulphanilic acid was added and to that 2 cubic centimeters of (alpha) naphthy-lamine. The presence of nitrites is indicated by the production of a pink color. The pink color in this water after the addition of these re-agents indicates the presence of nitrites, and the amount of nitrites is determined by making up a similar color with the same reagents, but adding a known quantity of standard potassium nitrite solution. We thus match colors and having the amount of nitrite required to produce that color, we decide that that amount of nitrite was present in the water. The amount is again expressed as so much weight of nitrogen in the form of nitrite present in a million parts of water.

The next determination was the nitrogen present as nitrates. For this purpose, 100 cubic centimeters of the water were evaporated to dryness in a platinum dish—or a porcelain dish was often used. And the dry residue was treated with a solution

of phenol-sulphonic acid. The sulphonic acid was brought into contact with the dry residue of the water, a few drops of sulphuric acid added, and then ammonia in excess. By this treatment nitrates are converted into a yellow pigment, and water is then added to make up the volume of 100 cubic centimeters. The yellow solution thus obtained is now compared with similar yellow solutions that have been made in the same way; by starting with known amounts of potassium nitrate and by matching color, the amount of nitrates existing in the water is determined, and the result expressed as so many parts of
1607 nitrogen present as nitrates in a million parts of water.

The chlorine in water is determined by measuring off 100 cubic centimeters of water and adding to it 1 cubic centimeter of potassium chromate solution, and then running in from a burette a standard solution of silver nitrate. The strength of the silver nitrate is of such a value that 1 cubic centimeter of the nitrate solution corresponds with one part of chlorine per million parts of water. The standard silver nitrate is run into the measured volume of water until a faint red color is produced. From the amount of silver solution used we calculate the weight of chlorine per million parts of water.

Then the last determination was the oxygen consuming power of water. This is determined by measuring 100 cubic centimeters of water and adding an excess of standard potassium permanganate solution, usually about 30 to 40 cubic centimeters, and boiling for fifteen minutes. The liquid is then treated with standard oxalic acid until colorless and by calculation we find out the amount of permanganate used, and from that the weight of oxygen required to oxydize the organic matter in one million parts of water.

So with the figures obtained in all these determinations, they are the actual weights of the substances in one million parts of water.

Q. Now, is there anything further in reference to the methods that you want to state?

A. No, sir, I think that covers the analytical processes.

1608 Q. You are familiar with the different methods of chemical analyses, I suppose?

A. Yes, sir.

Q. In making these analyses, did you follow any one particular method, or did you follow what you considered the best of the different classes or methods?

A. This in general is the method recommended by the American Society for the Advancement of Science, and it is regarded as the standard method, that is in use generally at the present time.

Q. I believe you stated that these tests were conducted by you personally, or under your personal supervision?

A. Yes.

Q. Where were they made?

A. At the chemical laboratory of the Washington University.

Q. Where is the Washington University?

A. At present it is at Twenty-seventh and Locust streets, but at the time these analyses were made the university was located at Eighteenth and Washington avenue, and all these analyses were made in the building at Eighteenth and Washington avenue.

Q. At what time did you begin this work of analyzing the waters of the Mississippi River, Missouri River, Illinois River, Des Plaines River, and the Chicago Drainage Canal?

A. We began the analyses on the 24th of January, 1900.

Q. And how long did those analyses continue at that time?

1609 A. We made daily analyses of the samples sent to us by the City Chemist, 12 samples daily, until October 11, 1900.

Q. Was there any change in the number of samples analyzed in 1900?

A. At first we analyzed 12 samples daily, and during the last five months 14 samples were received and analyzed each day.

Q. Then did you do any other analytical work on these waters at any later time?

A. One year later, in 1901, a daily analysis was made during the months of October and November.

Q. Ending when?

A. Ending on the last day of November.

Q. How many samples daily were received and analyzed during that period?

A. 14 samples each day.

Q. Were there any directions given for the collection of these samples?

A. I gave no directions for that. They were collected according to the directions given by the City Chemist, and I understood that two samples were taken at each point. One sample was delivered to the City Chemist for analysis, and the other sample was brought to me for analysis at the chemical laboratory of the Washington University.

Q. Of identically the same waters?

A. Of the same waters, taken at the same time.

Q. And they were made by yourself and the City Chemist,
1610 acting as analysts of the water, as duplicate analyses of
the same water taken at the same time?

A. Yes.

Q. Can you give me the names of the places where samples of waters were collected?

A. The places were as follows: First, the reservoir at the Chain of Rocks.

Q. (By Mr. Springer): What year was that?

A. In January, 1900. The reservoir at the Chain of Rocks. The Wet Well, Chain of Rocks. The Intake Tower Waterworks Chain of Rocks. The Missouri shore, at the Chain of Rocks. The Illinois shore at the Chain of Rocks. A sample was brought from Bellefontaine, above the Missouri River, above the mouth of the Missouri River. Another sample from Hartford, on the Mississippi River. Another one from Alton, on the Mississippi River. Another sample was collected at Grafton, three miles above in the Mississippi, and another sample came from three miles above Grafton in the Illinois River. Another sample was collected from a point two miles above Peoria, on the Illinois river. Samples were also brought from Lockport and Joliet. And later on, when we analyzed fourteen samples a day, a sample was taken from the running water, the tap in the chemical laboratory.

Q. What chemical laboratory do you refer to?

A. The chemical laboratory of the Washington University.

Q. Is it necessary, to obtain an idea of the changes which
1611 water undergoes from a sanitary standpoint, to consider
the fluctuations in the quantities of nitrogen compounds
that are present?

A. Yes, sir.

Q. Did you do that with this water?

A. Yes, sir.

Q. Did you do that with the reservoir water of this city?

A. Yes, sir.

Q. In what way did you make that test—that is, from where did you get those samples?

A. The samples came from the reservoir, and were delivered in the usual way.

Q. You analyzed these waters to determine the presence of nitrites, nitrate, albuminoid ammonia, free ammonia and chlorine?

A. Yes.

Q. And the amount of oxygen consumed?

A. Yes.

Q. And these different forms of chemical constituents found in the water are of chief importance in judging of the sanitary conditions of the water?

A. The presence of nitrites and free ammonia I regard as of chief importance.

Q. For what reason?

A. For the reason that the presence of measurable quantity of nitrites in drinking water is often regarded as a
1612 sure sign of contamination, and a chemist finding a measurable quantity of nitrites in water would condemn that
water as unsafe for drinking purposes. And so free ammonia, likewise, is of great importance in judging of the sanitary conditions of the water for the reason that the first product produced by bacteria in decomposing sewage is free ammonia. We always find a quantity of free ammonia in sewage, so the chemist lays special stress on these two constituents, namely, nitrites and free amonia.

Q. Chemically, what is free ammonia?

A. Free ammonia is ammonium carbonate, or ammonium chloride existing in the water, that has been formed by the action of bacteria upon nitrogenous organic matter.

Q. Is free ammonia one of the chemical constituents of pure water?

A. No, sir; free ammonia is absent from pure water.

Q. Then it must get into that water from some organic matter?

A. Yes.

Q. Of what is free ammonia and nitrites evidence of in water?

A. Evidence of contamination with nitrogenous organic matter.

Q. Is it evidence of changes, and if so, of what character?

A. Of bacteriological action; the presence of nitrites especially.

Q. They produce fermentative action?

A. Yes, there is fermentation going on in the water when
1613 we find nitrites.

Q. When that is found, does that show whether or not the water is able to take care of its own organic contamination?

A. It shows it is not able to take care of this contamination, and that it is undergoing putrefaction and decay. The presence of these nitrites indicates there is decaying vegetable or animal matter in the water.

Q. And the same with free ammonia?

A. Yes.

Q. That is the reason these two chemical substances are indication or warning to the chemist that the water should be looked upon with suspicion?

A. Yes.

Q. Have you a record of the fluctuations of the nitrites in the reservoir of this city from January 14, 1900, to October 11, 1900?

A. Yes.

Q. Is that given in weekly or daily averages in the parts of nitrites in a million parts of water?

A. We made daily analyses and from them made daily averages, and from the daily averages we made weekly averages.

1614 Q. You made the comparison to determine the fluctuations in the amount of nitrites in the reservoir water of this city?

A. Yes, sir.

Q. And you have those weekly averages of the parts of nitrogen present in one million parts of water in the form of nitrites, have you?

A. Yes.

Q Did you do the same thing from January 24th to 31st, 1900, inclusive, with the water of the Drainage Canal?

A. You mean the water taken at Lockport?

Q. Yes?

A. No, sir, not at that time.

Q. From January 24 to 31, 1900, what part per million of nitrogen did that water in the reservoir contain?

A. It had .0044 parts of nitrogen as nitrites per million.

Q. Now, will you give me the highest and lowest, with the dates, of the amount of nitrogen found in the water at the Intake Tower of the St. Louis Waterworks, between January 24 and October 11, 1900?

A. I have not tabulated the Intake here (referring to paper). It is on the larger record.

Q. You have the figures?

A. Yes, but they are not in this report (indicating). The figures for the Intake are in the tables that are in the room below; shall I get them?

Q. Yes, you had better get it because I want it in the record, because that is the starting point at the Intake.

A. The highest amount was February 10, 1900, .048. The lowest amount was later on in the year, June 21, 1900, .002.

1615 Q. I will get you to state, Professor, whether or not you have the weekly averages of the amount of nitrites found for the weeks from January 24 to October 11, 1900; and if so, have you the same in the shape of a table?

A. Yes, sir, I have.

Q. Please give that table, being table No. 1, which is an examination of the reservoir in the St. Louis Waterworks from January 24, 1900, to October 11, 1900?

A. Nitrites, parts per million.

(Jan. 24th-31st,	.0044 before Canal opened.)	
Feb. 1- 7th,	.0074)	
Feb. 7-14th,	.0080)	Average February, .0133.
Feb. 14-21st,	.0140)	
Feb. 21-28th,	.0240)	

Nitrites, parts per million.

	Mar. 1- 7th,	.0100)	
	" 7-14th,	.0080)	Average March, .0107.
	" 14-21st,	.0120)	
	" 21-31st,	.0130)	
	Apr. 1- 7,	.0140)	
	" 7-14,	.0170)	Average April, .0180.
	" 14-21,	.0260)	
	" 21-30,	.0140)	
	May 1- 7,	.0097)	
	" 7-14,	.0046)	Average May, .0055.
	" 14-21,	.0049)

	Sept. 1- 7,	.0015)	
	" 7-14,	.0011)	Average September, .0013.
	" 14-21,	.0016)	
	" 21-30,	.0010)	
	Oct. 1-10,	.0021)	Average October, .0021.

Q. Now, will you please give me the amount—average amount—of nitrites found in the reservoir water from January 24, 1900, to January 31, 1900?

A. It was .0044 parts per million. That was before the Canal opened.

Q. No, it was not before the Canal opened?

A. No, before it reached us here. We recorded it as such.

Q. Now, will you give me the average of nitrites found in that water for the month of February, 1900?

A. It was .0133.

1617 Q. Now, will you give me the average of the nitrites for March, 1900, in the water of the reservoir of St. Louis?

A. The average for March .0107.

Q. Now, give me the average for April for the same water?

A. .0180.

Q. Now, the average for May for the same water?

A. .0055.

Q. Now the average for June for the same water?

A. .0032.

Q. Now for July for the same water, the average?

A. .0017.

Q. Now for August?

A. .0021.

Q. Now the average for September for the same water?

A. 0013.

Q. Now, please give me the average for October for the same water?

A. .0021.

Q. Now, will you please give me the maximum of nitrites in the reservoir water between February 1st and February 28, 1900?

A. Between February 1st and February 28, maximum was .0240.

Q. Now, in what week in February, giving the dates, did that maximum occur?

A. In the week of February 21 to 28.

Q. Now, will you give me the maximum with the dates thereof in the month of March?

A. The maximum in the month of March was in the week of March 21 to 31, and the amount was .0130.

1618 Q. Now, will you please give me the maximum amount in April together with the date of the month thereof, the week?

A. The maximum amount was in the week of April 14 to 21 and the amount was .0260.

Q. Now, will you give me the maximum amount for May together with the beginning and ending of the week in which it occurred?

A. The maximum amount in May was in the week May 1st to 7th and the amount was .0097.

Q. Now, please give me the maximum amount for the month of June with the beginning and ending of the week?

A. The maximum occurred in the week June 1st to 7th, and the amount was .0040.

Q. Now, please give me the maximum amount for the month of July with the date of the beginning and ending of the week?

A. The week of July 14 to 21, the amount was .0021.

Q. Now, please give me the same for July, the maximum?

A. For August, you mean?

Q. Or August?

A. For August the maximum amount was in the week August 14 to 21, the amount was .0035.

Q. Now, please give me the maximum amount for September, together with the date?

A. September 14 to 21, the amount was .0016.

Q. Now, please give me the average for October 1st to 10th?

A. October 1st to 10th, the average .0021.

Q. I present you plate No. 1. Just please state what that is?

A. This is a curve showing the changes in nitrites in the reservoir water.

Q. Reservoir water of what place?

1619 Of St. Louis from January 24 to October 10, 1900, and is also in pencil a curve representing the changes of nitrites in the reservoir water of St. Louis from October 1st, 1901, to November 30th, 1901.

Q. Now, just explain the meaning of those curves on that chart?

A. This curve shows that early in February, 1900—

Q. No; explain the meaning of the curve?

A. Well, a curve meaning the varying amount of nitrites in the reservoir water in St. Louis, and it is made by plotting off—

Q. Just explain your map, what it reads—how to read your map?

A. The curve is made by plotting off the dates, the weekly dates on the horizontal line, and the quantities of nitrites found in the water on the vertical column, and the figures, the averages which have just been recorded in the tables, are here plotted out in the form of a curve.

Q. Here in table No. 1, say?

A. Yes, in table No. 1. And the points obtained have been joined by a red line showing the variance in the amount of nitrites in the reservoir water during the period of our analyses.

MR. CROW: Now, you just mark this as plaintiff's Exhibit No. 23.

Said chart is marked by the Commissioner "Complainant's Exhibit No. 23, Frank S. Bright, Commisioner."

Q. Now, you know when the Drainage Canal was opened?

A. January 17.

1620 Q. What year?

A. 1900.

Q. Now, this table and this chart, do they disclose anything with reference to the increase or decrease in the quantity of nitrites in the reservoir water as related to the opening of the Drainage Canal?

Q. It shows that early in February the quantity of nitrites in the reservoir water began to increase very materially, and the water of the reservoir was in a highly polluted condition.

Q. Go ahead with your statement there?

A. The water became badly polluted in the month of February, and this pollution continued during March and during April. In May—about the end of April and in the beginning of May, the quantity of nitrites materially diminished; and then during the summer months it was low, and in October they began to increase again—in 1900. Then in 1901 we continued the analyses, found that they were again higher.

Q. Now, what causes do you, as a chemist and analyst of these waters, attribute the rise in February to April and the decline in May, June and July?

A. The abnormal increase in February in nitrites in the reservoir water we attributed to the coming down in the Mississippi river of large quantities of sewage.

Q. From what source?

A. As shown by our other analyses, analyses borne out by analyses made at other points on the Mississippi—at Alton and Grafton on the Mississippi, and on the Illinois, it was shown that they came down this river.

Q. From whence did they come into the Illinois river?

A. Well, our analyses point to the Drainage Canal as the source of them.

1621 Q. To what do you attribute the decline in May, June and July from the pollution?

A. The falling off in the quantity of nitrites in the reservoir water in the spring months was co-incident with the heavy rains and the high stages of the river.

Q. What effect did the high stage of the river have that caused a diminution of the nitrites?

A. By the greater dilution by means of the large volume of rain water flowing into the rivers the quantity of nitrites was very materially diminished in the early part of May and during June, and in the summer months the high stages continued.

Q. What causes a high stage in the Mississippi usually in June at St. Louis?

A. Well, the melting of the snows.

Q. In the water shed of what river?

A. Of the Missouri river.

Q. What does the rainfall diminish the nitrites by?

A. By dilution.

Q. Simply by that you mean the increase in the volume?

A. In the volume of the water.

Q. Does that destroy the nitrites?

A. No, sir.

Q. What effect has it, then?

A. Simply to diminish the amount per cubic centimeter, or per million of water.

Q. The amount of nitrogen in a given quantity of water?

A. Yes, sir, the amount of nitrogen in a given quantity of water.

Q. Then, to put it inversely, it increases the amount of water to the given amount of nitrogen?

A. Yes, sir.

1622 Q. And the deduction from that is that the lowest quantity of the nitrogen would come with the water into the reservoir?

A. Yes, sir.

Q. Now, you made one year later an analysis of the water from the Intake of the St. Louis Waterworks, I believe?

A. Yes, sir.

Q. Now, you made that analysis for the purpose of determining the amount of nitrites in the water of the Intake Tower?

A. Yes, sir.

Q. What was the date of that examination?

A. It began in October, October 1st, 1901, and was ended November 30th, 1901.

Q. Have you the weekly averages of the nitrites in the period mentioned in 1901, of the examination of the water at the Intake Tower of the St. Louis Waterworks?

A. Yes, sir.

Q. Will you please furnish me that table?

A. Table No. 2, October 1st, 1901, to November 30th, 1901, of the examination of the water for nitrites at the Intake Tower of the St. Louis Waterworks:

1623

	Pts. per Million.
Oct. 1- 7,	.0037
" 7-14,	.0029
" 14-21,	.0050
" 21-28,	.0048
Oct. 28-Nov. 4,	.0131
Nov. 4-11,	.0131
" 11-18,	.0143
" 18-25,	.0130
" 25-30,	.0116

1624 Q. Now, will you give, if you have it, the maximum amount for the month of October of the nitrites found in Intake Tower of the Waterworks from October 1st to October 28, 1901?

A. The maximum amount in October was in the week of October 28 to November 4, and the amount was .0084.

Q. Now give the maximum amount for November, 1901, of this water at the Intake Tower of the St. Louis Waterworks for nitrites?

A. The maximum amount in November was in the week November 11 to 18, and the amount of nitrites was .0143.

Q. Now, how do these amounts of nitrites found compare with the nitrites found a year previous in 1900?

A. In 1901 there was an increase over what had been found in 1900.

Q. In nitrites?

A. In nitrites.

Q. Did you make any examination of the water for free ammonia?

A. Yes, sir.

Q. Now, is there any standard above which the amount of free ammonia should not rise in waters that are potable?

A. Yes, sir. When the amount of free ammonia in river water rises above .045 per million the water is regarded with suspicion, and it is generally recognized that such water is polluted.

Q. Now, Professor, that is not a hard and fast rule, however, that is applied under all circumstances?

A. No, sir.

Q. That will vary, will it not, with the local history of the water and the local surroundings?

A. Yes, sir.

1625 Q. For instance, a water might contain more free ammonia than that and it might be from a source that was absolutely harmless?

A. Yes, sir.

Q. To illustrate, the salt might be placed in such juxtaposition to a well or reservoir that it would cause a much higher percentage of free ammonia and be absolutely harmless from a sanitary standpoint?

A. Yes, sir.

Q. Now, this examination for free ammonia, was it made of the water in the reservoir?

A. Yes, sir.

Q. From what period of time to what period of time?

A. From January 24, 1900, to October 11, 1900.

Q. Was it made for the purpose of determining the amount of free ammonia in the reservoir?

A. Yes, sir.

Q. And was it made on a weekly average?

A. Yes, sir, we made daily analyses.

Q. In what manner did you obtain that weekly average?

A. We made daily analyses of the water brought to us from the reservoir, and the average results for each week were put down and were taken as the weekly average.

Q. Now, have you recorded the weekly average result of that investigation?

A. I have weekly and monthly averages of free ammonia in reservoir of St. Louis Waterworks between January 24, 1900, and October 11, 1900, which is table No. 3.

Q. Please give us that table?

A. The table is as follows:

1626 Weekly and Monthly Averages of Free Ammonia in Reservoir.

	Pts. per M.	
Jan. 24-31,	0.1112)	January average, .1112.
Feb. 1- 7,	.2265)	
" 7-14,	.2345)	February average, .2098.
" 14-21,	.1689)	
" 21-28,	.2094)	
Mar. 1- 7,	.1357)	
" 7-14,	.1643)	March average, .1890.
" 14-21,	.1980)	
" 21-31,	.2848)	
Apr. 1- 7,	.2690)	
" 7-14,	.2234)	April average, .1664.
" 14-21,	.1030)	
" 21-30,	.0703)	

		Pts. per M.	
May	1- 7,	.0417)	
"	7-14,	.0254)	May average, .0377.
"	14-21,	.0345)	
"	21-31,	.0491)	
June	1- 7,	.0234)	
"	7-14,	.0066)	June average, .0130.
"	14-21,	.0100)	
"	21-30,	.0120)	
July	1- 7,	.0117)	
"	7-14,	.0228)	July average, .0199.
"	14-21,	.0265)	
"	21-31,	.0186)	

1627

Aug.	1- 7,	.0320)	
"	7-14,	.0220)	August average, .0276.
"	14-21,	.0223)	
"	21-31,	.0343).	
Sept.	1- 7,	.0208)	
"	7-14,	.0348)	September average, .0250.
"	14-21,	.0263)	
"	21-30,	.0283)	
Oct.	1-10,	.0316)	October average, .0316.

1628 Q. Now will you, if you have it, give me the average amount of free ammonia per million found between January 24 and January 31 in the water of the reservoir of St. Louis?

A. The average for that time was .1112.

Q. Now will you give me the maximum amount of free ammonia found in the reservoir in February, 1900?

A. The maximum amount occurred in the week of February 7 to 14, and amounted to .2345 parts of nitrogen as free ammonia per million.

Q. Now will you give me the average of free ammonia in the reservoir for February, 1900?

A. The average amount was .2098 per million.

Q. Please give me the maximum amount for March, 1900, begin and end with the week?

A. The maximum amount occurred in the week of March 21 to 31, the amount .2848.

Q. Please give me the average of free ammonia for the month of March?

A. The average amount for the month of March was .1890 parts of nitrogen per million.

Q. Now give me the maximum amount for April, 1900?

A. The maximum amount occurred in the week April 1st to 7th, and amounted to .2690 parts of nitrogen per million of water.

Q. Now give me the average for April free ammonia?

A. And the average for April .1164 parts of nitrogen.

Q. Please state the maximum amount in May?

A. The maximum amount in May occurred in the week May 21 to 31, and amounted to .0491 parts of nitrogen per million.

Q. Please state the average amount of free ammonia?

A. The average amount .0377 parts nitrogen per million.

1629 Now please give me the amount for June, 1900?

A. And the maximum amount in June in the week for June 1st to 7th .0234.

Q. What was the average for June?

A. And the average for June was .0130 parts nitrogen per million.

Q. Please state the maximum amount for July?

A. Occurred in the week July 14 to 21, and amounted to .0265 nitrogen per million of water.

Q. What was the average of free ammonia for July?

A. The average of free ammonia for July was .0199 parts of nitrogen per million of water.

Q. What was the maximum for August, 1900?

A. The maximum for August occurred during the week August 21 to 31 and amounted to .0343 parts of nitrogen per million of water.

Q. What was the average for August?

A. The average for August .0276 parts of nitrogen per million.

Q. No, that is not nitrogen, it is free ammonia?

A. No, nitrogen as free ammonia.

Q. What was the maximum for September?

A. The maximum occurred during the week September 14 to 21, amounted to .0263 parts of nitrogen as free ammonia per million.

Q. And the average?

A. And the average for September was .0250 parts nitrogen per million.

Q. You are talking about August or September?

A. September.

1630 Q. Look at your figures?

A. For August the average .0276.

Q. Now for September?

A. Now the maximum occurred during the week September 21 to 30, .0283.

Q. What is the average?

A. .0250.

Q. On October 1st to 10th?

A. Of October, from October 1 to 10 was .0316, and that we take as the average for the month.

Q. Now what do these figures indicate with reference to the pollution of this water?

A. Well, these weekly averages and also monthly averages show great increase in the free ammonia immediately after the last week in January, and this high ammonia continued throughout the months of February, March and April. After the 21st of April there was an improvement in the water, which continued until the middle of June, and after June, there was a slight increase in July and August, and again in October. So that throughout the summer the water was much better than it had been in February and March.

Q. Now I will show you chart No. 2. What is that, and what does it purport to be?

A. Well, this is a chart on which there is plotted a curve, showing the changes in the amount of free ammonia in the reservoir water, in the St. Louis reservoir from January 24 to October 10, 1900.

Q. Now describe the map so anybody looking at it will understand what it means.

A. The dates are measured off on a horizontal line and
1631 the quantities of free ammonia are measured on the vertical line, and the weekly averages from the table that has just been read are plotted on this map, and these points are joined by a red line, and this red line shows the variation in the amount of free ammonia in the reservoir water from the time stated, from January 24th to October 10th, 1900.

Mr. Crow: I will offer it in evidence.

Said chart is marked by the Commissioner "Complainant's Exhibit No. 24, Frank S. Bright, Commissioner."

Q. Now what does this table and this map show with reference to the condition of the water at the Intake from January 24th to October 11th with reference to absence or presence of free ammonia?

A. It shows a very great increase immediately after the first week in February. The quantities of free ammonia increased very considerably in the reservoir water.

Q. In what time?

A. In 1900, in February, 1900.

Q. Did that extend into any other months besides that?

A. It extended into March and April and began to diminish then just as previously the nitrites were diluted by the spring rains, so we find that the ammonia was diluted and the quantity found in the reservoir water was very much less during the spring and summer months than it had been immediately after the opening of the Drainage Canal.

Q. Well, have you any explanation as a chemist to offer of the great increase in proportion of ammonia in February, March and April, 1901 at the water of the Intake at the
1632 Water Works?

A. The only explanation that I have to offer is at that time there was an enormous increase in the pollution in the Mississippi river.

Q. And where was that traceable to, if you know, chemically?

A. The analyses that were carried out at the same time simultaneously with these of water samples taken at Alton and at Grafton, Illinois river, and in the Mississippi river above Grafton and at Peoria showed there was simultaneously with this increase in the reservoir an increase in the free ammonia in the water at these points—that is, that the pollution came down the Illinois river.

Q. Was it traceable any farther than the mouth of the Illinois river?

A. Yes, sir, we traced it to Peoria and farther up beyond Peoria.

Q. How far up?

A. Up to Joliet and Lockport.

Q. What is at Lockport?

A. The opening of the Drainage Canal.

Mr. Woerner:

Q. You mean the end of it?

A. The end of it.

Mr. Crow: Then that was traced to the point where the Drainage Canal entered into the Des Plaines river?

A. Yes sir.

Q. Now was there any decrease in June and July in the free ammonia in the water at the Intake in 1900?

A. Yes sir.

Q. Was there any change in August and September?

A. There were slight changes, fluctuation in the amount; it was somewhat higher. It was somewhat higher in July, gradually began to increase. There was a slight increase in
1633 July and August and again in October.

Q. Now did you make any averages of the free ammonia found in the Intake of the Water Works of this city during the months of October and November, 1901?

A. Yes sir, I did.

Q. Have you that table?

A. Yes sir.

Q. Now please furnish me with that table?

A. Yes sir.

Mr. Crow: This is the table giving the weekly averages of free ammonia found in the water of the Intake of the St. Louis

Water Works during the month of October and November, 1901, being marked table No. 4.

Q. Please give that table?

1634 A. In the following table are given the weekly averages of free ammonia found in the water of the intake during the months of October and November, 1901:

Oct. 1- 7 incl.	.129.
“ 7-14 “	.051.
“ 14-21 “	.046.
“ 28-Nov. 4	.071.
Nov. 4-11	.070.
“ 11-18	.086.
“ 18-25	.072.
“ 25-30	.071.

1635 Q. Now just state how you arrived at these weekly averages?

A. These weekly averages were made from the daily analyses by adding together the results obtained from each day of the week and then dividing by 7 we obtained the weekly average.

Q. Can you give me the maximum of free ammonia found in the water of the Intake during the month of October, 1901, together with the beginning and ending of the week in which it was found?

A. The maximum in October occurred during the week of October 1st to 7th, and the amount was .129 parts of nitrogen as free ammonia in the reservoir water.

Q. Now give me please the maximum amount found in the month of November of free ammonia in the water of the Intake in 1901, together with the beginning and ending of the week?

A. In November the maximum occurred in the week of November 11th to 19th and the amount was .086 parts of nitrogen as free ammonia.

Q. Now what do these tables show, if anything, with reference to increase or decrease over the free ammonia found in the Intake during the months of October and November, 1900?

A. It shows that in 1901 there was a larger quantity of free ammonia in the water of the Intake than had been found in the previous year.

Mr. Springer: For the corresponding months of the previous year?

A. For the corresponding time in the previous year.

Mr. Crow: Did you make any examination of the water of the Intake or the reservoir for the nitrates in 1900?

A. Yes sir.

Q. Have you got a table of that?

1636 A. Yes sir, I have a table.

Q. This table then would be a table of nitrates from January 24th to October 10th, inclusive, 1900, of the water in the reservoir of the St. Louis Water Works and is table No. 5.

A. Yes sir.

Q. Now please give that table.

A.

“	21-30,	.38)	
Oct.	1-10,	.53)	Average for October, .53.

1639 Q. Now from this table and the averages thereof during the period from January 24th to October 10th, inclusive, 1900, can you state whether or not there was an increase or decrease in the amount of nitrates found in the reservoir of the St. Louis water works?

A. The table shows that there was a decided increase in February, also in March; then a gradual decrease in April, and that decrease became more pronounced in May. There was a slight increase in June, and a decrease in August and September. In October we find the value very near the same as at the beginning.

Q. Well was the increase in the month of February, March and April following the opening of the canal?

A. The increase began about the time when the water of the Drainage Canal reached St. Louis, and then it increased still more during the rest of the month of February and during the month of March. Then again as in the other cases when the spring floods came there was a diminution in the quantity of nitrates in the reservoir water.

Q. Now have you a record of your investigations of the water at the Intake of the St. Louis Water Works from October 1st, 1901, to November 30, 1901, to determine the quantity of nitrates in the same?

A. Yes sir.

Mr. Crow: This is table No. 6, being a table giving the nitrates found in the water of the Intake of the Water Works from October 1st to November 30th, 1901.

Q. Please give that table.

A.

1640

Oct.	1- 7,	.60
"	7-14,	.29
"	14-21,	.21
"	21-28,	.43
"	28-Nov. 4,	.38
Nov.	4-11,	.27
"	11-18,	.25
"	18-25,	.12
"	25-30,	.12

1641 Q. I show you now plate No. 3, will you please state what that is?

A. This plate contains a curve showing the changes in the amount of nitrates found in the reservoir water, and on the horizontal line the times are measured off, and on the vertical line the amount of nitrates are measured off and by means of weekly averages. They were found by analyses, and the curves were plotted and the points for each week joined by a red line, and this red line gives a graphic representation of fluctuation or changes of the amount of nitrates in the reservoir water from January 24 to October 10th, 1900, and then in pencil there is also a curve showing the amount of nitrates in 1901.

Q. At the time in the water in October and November, 1901?

A. We see from this curve that the maximum quantity of nitrates was reached in February and March, 1900, and it was higher during April, but during the summer months it was lower.

Q. How about 1901?

A. 1901 it was still high, about the same as it had been in 1900, in the corresponding months in 1900.

Q. Well, is there a decrease or increase in the nitrates in 1901 over that of 1900? Look at your table and see?

A. Nitrates are lower.

Q. Lower in 1901 than in 1900?

A. Than in the previous year.

Q. Now what would that indicate, if anything, chemically?

A. Well, it would indicate that the oxidation of the nitrites had not proceeded as far.

Q. What would that mean as to the purity or impurity of the water?

A. Well, it would indicate that fermentation was in active
process and had not yet been completed, the nitrates being
1642 the final products of the oxidation of the nitrogenous or-
ganic matter. The absence or presence of a small quantity of nitrates would show that the water was in an unstable condition.

Q. If the water had less nitrates in 1901 than in 1900 was it less pure or more impure?

A. It was more impure.

Q. Because of what fact?

A. Because the organic matter had not been completely oxidized.

Q. Now do you know whether or not from your examination of the water during this period, 1901, it showed more nitrites than it did in 1900?

A. Nitrites?

Q. Yes, sir?

A. There were more nitrites but less nitrates.

Mr. Crow: I now offer this map in evidence.

Said map is marked by the Commissioner:

"Complainant's Exhibit No. 25, Frank S. Bright, Commissioner."

Adjourned until 2 P. M., March 13, 1903.

IN THE

Supreme Court of the United States

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS
and
THE SANITARY DISTRICT OF CHICAGO.

Original,
Docket No.

Before
FRANK S. BRIGHT,
Commissioner of the Supreme Court of the United States.

VOLUME 2.

A—63½

VOLUME. 2.

1643 Session resumed pursuant to adjournment at 2 P. M. March 13th, 1903.

Present, the Commissioner and same counsel representing the respective parties.

EDWARD H. KEISER resumed the stand for further examination and testified as follows:

Direct examination resumed by Mr. Crow.

Q. Now, what is the fourth form in which nitrogen is found in water? A. The fourth form in which nitrogen is found in water is as albuminoid ammonia.

Q. Is that found in water in its natural state free from pollution?

A. No sir.

Q. What is it the product of? A. It is the product of decomposing nitrogenous organic matter.

Q. Now, would that albuminoid ammonia be derived from both vegetable and animal matter in water? A. Yes sir.

Q. What is the condition of reservoir water of the city of St. Louis as to whether it is turbid. A. It is turbid at nearly all times of the year.

Q. That means chemically it contains what? A. It contains washings of the surface of the earth, contains vegetable matter that has been carried in by rainfall.

Q. Are they materials from the soil and fields? A. Yes sir.

Q. Now, did you make an investigation of the reservoir water to determine the quantity of albuminoid ammonia contained in it if so during what periods of time? A. I determined the amount of albuminoid ammonia in reservoir water from January 24th, 1900 to October 11th, 1900, daily determinations.

Q. From those daily determinations did you make averages? A. I did.

Q. What were the averages, were they weekly or monthly?
A. Weekly averages at first and afterwards monthly averages.

Q. Have you got a table containing the result of that
1644 work as performed by you? A. I have.

Q. Please give that table? A. This is a table for determining the albuminoid ammonia in the water of the reservoir made by me between January 24th and October 11th, 1900, and is table No. 7.

1645 The following are the weekly averages for albuminoid ammonia obtained:

Jan. 24-31,	.214)	Average for January, .214.
Feb. 1- 7,	.199)	
" 7-14,	.285)	Average for February, .271
" 14-21,	.259)	
" 21-28,	.344)	
Mar. 1- 7,	.233)	
" 7-14,	.325)	Average for March, .410.
" 14-21,	.582)	
" 21-31,	.501)	
Apr. 1- 7,	.264)	
" 7-14,	.387)	Average for April, .313.
" 14-21,	.248)	
" 21-30,	.352)	

	May 1- 7,	.279)	
	" 7-14,	.285)	Average for May, .261.
	" 14-21,	.224)	
	" 21-31,	.257)	
1646	June 1- 7,	.155)	
	" 7-14,	.172)	Average for June, .182.
	" 14-21,	.161)	
	" 21-30,	.240)	
	July 1- 7,	.219)	
	" 7-14,	.192)	Average for July, .234.
	" 14-21,	.249)	
	" 21-31,	.275)	
	Aug. 1- 7,	.304)	
	" 7-14,	.233)	Average for August, .257.
	" 14-21,	.202)	
	" 21-31,	.289)	
	Sept. 1- 7,	.276)	
	" 7-14,	.238)	Average for September, .237.
	" 14-21,	.225)	
	" 21-30,	.210)	
	Oct. 1-10,	.335)	Average for October, .335.

1647 Q. Now, can you give the highest maximum for February of albuminoid ammonia in the reservoir water?

A. The highest maximum for February occurred in the week of February 21st to 28th.

Q. What was it?

A. .344 parts per million.

Q. What was the average of albuminoid ammonia in the reservoir water in February?

A. The average for February was .271 parts per million.

Q. What was the maximum for March?

A. The maximum for March occurred in the week from the 14th to the 21st and the amount of it was .582 parts per million.

Q. What was the average?

A. The average for the month was .410 parts per million.

Q. What was the maximum for April?

A. The maximum for April was in the week of April 7th to the 14th, and the amount was .387.

Q. What was the average?

A. The average for the month of April was .313 parts per million.

Q. What was the maximum for May?

A. The maximum for May occurred in the week of May 7th to 14th, and the amount was .285 parts per million.

Q. What was the average?

A. The average for May was .261 parts per million.

Q. What was the maximum for June?

A. For June the maximum occurred from June 21st to the 30th, and the amount was .240 parts per million.

Q. What was the average?

A. The average for June was .182.

Q. What was the maximum for July?

A. The maximum for July occurred in the week of July 21st to 31st, and the amount was .275.

Q. What was the average?

A. The average for the month of July was .234 parts per million.

Q. What was the maximum for August?

1648 A. The maximum for August occurred in the week from August 1st to 7th, and the amount was .304 parts per million.

Q. What was the average for August?

A. The average for the month was .271 parts per million.

Q. What was the average for September?

A. For September the maximum occurred in the week from September 1st to 7th, and the amount was .276 parts per million.

Q. What was the average?

A. The average was .237 parts per million.

Q. What was the average from October 1st to 10th?

A. The average was .335 parts per million of nitrogen as albuminoid ammonia.

Q. Now, have you the record of the work you did in October and November, 1901, upon the reservoir water of this city for determining the quantity of albuminoid ammonia therein?

A. I have.

Q. Please present that table?

A. This is a table containing the results of the determination of the water of the reservoir of St. Louis for the months of October and November, 1901, for albuminoid ammonia, and is table No. 8:

1649 Weekly averages of the amounts of albuminoid ammonia found in intake water during the months of October and November, 1901:

Oct. 1- 7, incl.,	.855
“ 7-14, “	.677
“ 14-21, “	.523
“ 21-28, “	.727
“ 28-Nov. 4,	.553
Nov. 4-11,	.493
“ 11-18,	.794
“ 18-25,	.536
“ 25-30,	.420

1650 Q. I show you plate No. 4 (handing paper to witness), what is that, describe it so that one examining it would be able to tell what the figures and lines thereon mean?

A. Plate No. 4 contains a curve showing the changes in the amount of albuminoid ammonia in the reservoir water. The curve is constructed by laying off the weeks in a horizontal line and the amounts of albuminoid ammonia in vertical lines and a point is thus obtained for the average quantity of each week. These points are connected with a red line and thus we get a curve showing the variation in the amount of albuminoid ammonia in the reservoir water during the time of the analyses.

Q. Now, according to these figures and that map when did the maximum pollution of the water of the reservoir occur?

A. The maximum pollution occurred in March and April, 1900.

Q. When was the minimum?

pounds to be in the shape they can be readily detected by the chemist?

A. A chemical analysis does not enable us to determine the number of bacteria in water, but it gives us the total weight of nitrogen which is there in the bacteria and in the food of the bacteria, and when we determine the amount of nitrogen in those four forms we are getting the characteristic elements of the substances in water that may cause disease.

Q. Are there any forms of bacteria or do the bacteria themselves of different kinds cause nitrites and albuminoid ammonia to be formed?

A. Our ideas in regard to this are that the bacteria first of all act upon the organic matter, the nitrogenous organic matter, a compound of carbon, hydrogen, oxygen and nitrogen, and convert this into simpler products, they liquefy it and one of the products, one of the first products formed, is ammonia, that which we call free ammonia.

Q. What class of bacteria is it that operates to cause free ammonia?

A. The anaerobic bacteria.

1653 Q. Do they carry on their operations best in the presence or absence of oxygen?

A. Absence of ogygen.

Q. What is the next stage—the process is to break it up?

A. Break it up, to liquefy it and we get ammonia, the nitrogen appears as ammonia, we call it free ammonia because it comes off by distillation, when water is distilled it passes off as ammonia gas with the steam and is condensed.

Q. What is the next step?

A. The next step is that the bacteria come in and convert a portion of the nitrogen into nitrites.

Q. What class of bacteria?

A. The aerobic bacteria.

Q. Do they work best in the absence or presence of oxygen?

A. In the presence of oxygen.

Q. When the anaerobic cease their work and the aerobic cease their work, does the first named bacteria die or are they suspended in the water?

A. I am not a bacteriologist.

Q. Your chemistry does not teach you?

A. It does not teach us that.

Q. You do not deal with that?

A. From our chemical standpoint we do not look for bacteria.

Q. What happens then?

A. Then the nitrites are oxidized still further to nitrates.

Q. How is that done?

A. That is brought about by the operation of the organism, the bacterium, that has the power of oxidation and makes the nitrites combine with more oxygen converting them into nitrates.

Q. Now, regarding these three forms of ammonia as indices of water containing pollution either of organic or animal matter, which is regarded as the higher form of pollution?

A. When we find free ammonia and nitrites present in considerable quantities we regard the pollution as of animal origin and caused by sewage. Albuminoid ammonia on the other hand is not in itself so characteristic of polluted waters because albuminoid ammonia may be there of vegetable origin.

1654 Q. Now, albuminoid ammonia is a product midway between nitrites and free amonia, is it not?

A. Nitrogenous organic matter is the starting point from which the albuminoid ammonia as ammonia is gotten out of the organic matter in water by treating it with an alkali and by potassium per manganate, and in that way we distill off ammonia from the organic matter which is not there as ammonia in the water. We decompose what organic matter is left in the water by chemical agents and measure the ammonia that distills over.

Q. It is a product of combining an outside agency with a substance in water?

A. Yes, sir.

Q. And produces albuminoid ammonia?

A. Yes, sir.

Q. And for that reason albuminoid ammonia is not an index of any particular pollution in water?

A. No, sir.

Q. Nitrates are regarded as a lower form of pollution, there is a lower form of pollution of water that contains nitrates than nitrites?

A. That is so, the nitrates are a final product, when we find very little ammonia and no nitrites, and a good deal of nitrates we know the water has been polluted at one time, and it has gone through the process of oxidation so the pollution has been rendered comparatively harmless.

Q. Please explain what you mean by the use of the term oxidation as applied to the chemical process that goes on in the oxidation of organic matter in water from its original form in which it is put into water down to nitrates?

A. That oxidation is brought about by bacteria, we look upon it as a process of the transference of ogygen from the air to the organic matter in the water so that the complex organic substances are resolved into simple inorganic material. I look upon the original form of polluted matter in water as a complex combination of carbon, hydrogen, ogygen and nitrogen.
1655 That would represent, for instance, albuminoids,
albuminous substances that are in water, compounds of that kind are in sewage, and the bacteria break up those substances and we get ammonia, a part of the nitrogen is evolved as ammonia and then afterwards the bacteria transfer the oxygen from the air to the nitrogen that is there, forming nitrites and then transforming the nitrites into nitrates.

Q. By adding still more oxygen?

A. By adding still more oxygen, and the carbon, that is in the original substance appears as carbon dioxide gas and carbonates that we have present in carbonated waters, that come out as gases, some carbon comes off as marsh gas in the early stages, the anaerobic bacteria emit some in the shape of marsh gas and carbon dioxide.

Q. The analysis of the water that you made was made at the intake of the reservoir for determining the presence of these four bodies?

A. Yes, sir.

Q. Nitrites, free ammonia, albuminoid ammonia and nitrates?

A. Yes, sir.

Q. Did you examine for the purpose of determining whether there was chlorine in the water?

A. I did; I have the record of chlorine at different points, weekly averages and so on.

Q. Now, did you make a comparison of the water on the Missouri and Illinois shores opposite the Chain of Rocks?

A. I did.

Q. Now, for what purpose did you make that comparison chemically?

A. For the purpose of determining whether the river at the intake was of homogeneous character, whether the water was of the same character on both sides of the river.

Q. I will ask you if, chemically, that fact can be established, as if there was a cross section of the stream, if a line was drawn across it, whether the water on both sides of
1656 the stream is of the same chemical constituents?

A. It can.

Q. That can be determined definitely?

A. Yes, sir.

Q. Did you find any difference in the character of the water, chemically, water taken at the Missouri shore opposite the Chain of Rocks and water taken at the Illinois shore opposite the Chain of Rocks?

A. I did, a very marked difference.

Q. What was the first difference that you found?

A. I found that there was a difference in the nitrites.

Q. Have you got a table of the weekly average of the nitrites found in waters opposite the intake on the Illinois shore and opposite the intake on the Misouri shore?

A. Yes, sir.

Q. Have you the table there?

A. I have (producing a paper). This is a table showing the parts of nitrites per million from January 24th, 1900, to October 11th, 1900, first at the Missouri shore opposite the intake and second at the Illinois shore opposite the intake, and is table No. 9.

A comparison of the water on the Missouri shore with that of the Illinois shore at the Chain of Rocks.

Q. How did you determine the weekly average, did you
1659 take samples weekly?

A. Samples were taken daily.

Q. How was the weekly average ascertained?

A. By adding our daily determination for each day of the week and dividing by seven.

Q. That product is used as the average?

A. As the average for the week.

Q. Can you give me from January 24th to 31st the average nitrites found on the Misouri shore per million parts?

A. The average amount found for the week of January 24th to the 31st was .007 parts per million.

Q. Can you give me the same figures for the Illinois shore for the corresponding period?

A. For the same period the average found at the Illinois shore was .013.

Q. Can you give me the maximum amount of nitrites found in the month of February, 1899, on the Missouri shore together with the average, and, also, on the Illinois shore together with the average?

A. During the month of February the highest amount was found during the week of February 21st to 28th on the Missouri shore and it was .0206, and the highest amount found on the Illinois shore for the month of February was in the first week, February 1st to the 7th, the amount was .0214.

Q. What was the average?

A. The average on the Missouri shore for February was .0144 and on the Illinois shore the average for February was .0187.

Q. Please give me the maximum on the Missouri and Illinois shores for March together with the average on each shore?

A. The maximum during the month of March occurred in the period from March 21st to the 31st and amounted to .0223; the average for March on that shore, the Missouri shore, was .0168; the maximum amount on the Illinois shore occurred during the week from March 14th to 21st; the amount was
1660 .0254 and the average for March was .0164.

Q. Please give me the maximum for April on the Missouri shore and on the Illinois shore and the average?

A. The maximum occurred the first week, from April 1st to the 7th, and was .0325.

Q. What was the average?

A. The average was .0168; the maximum amount on the Illinois shore occurred also in the first week, April 1st to 7th, and the amount was .0365; the average for April on that shore was .0308.

Q. Please give me the maximum for May on the Missouri and Illinois shores and also the average?

A. The maximum for May occurred in the first week of May, May 1st to 7th, and the amount was .0057; the average for May was .0035; the maximum amount on the Illinois shore during the month of May occurred in the period of May 21st to 31st and its amount was .0178; the average on the Illinois shore for May was .0154.

Q. Please give me the maximum for June on the Missouri and Illinois shores together with the averages?

A. The maximum for June occurred in the first week of June, the 1st to the 7th, and was .0028 on the Missouri shore; the same amount, however, was found in the week of June 14th to the 21st; the average for June on the Missouri shore was .0026; the maximum amount found on the Illinois shore in June occurred during the period of June 21st to the 30th and the amount was .0084; the average for June was .0050.

Q. Please give me the maximum for July on the Missouri and Illinois shores together with the average?

A. The maximum for July occurred in the week of July 7th to 14th, and the amount on the Missouri shore was .0017; the average for that month on the Missouri shore was .0014; the

maximum amount on the Illinois shore occurred in the
1661 week of July 7th to 14th and the same amount was found
in the following week, July 14th to the 21st; the quantity
was .0043 for the Illinois shore and the average for July was
.0041.

Q. Please give me the maximum nitrites for August on the Missouri and Illinois shores together with the average for the weeks?

A. The maximum amount during August occurred on the Missouri shore in the period from August 21st to 31st and the amount was .0017 parts of nitrites per million; the average for August on the Missouri shore was .0012; the maximum amount on the Illinois shore occurred in the week of August 14th to 21st and that amount was .0102; the average for August on the Illinois shore was .0063.

Q. Please give me the maximum nitrites in September on the Missouri and Illinois shores together with the average?

A. The maximum weekly average on the Missouri shore during September occurred in the first week, September 1st to 7th, and the amount was .0016; the average for September was .0008; the maximum amount on the Illinois shore during September occurred in the week from the 7th to the 14th, and the amount was .0071; the average for September was .0068.

Q. Please give me the average for October 1st to 10th, 1900, on the Missouri and Illinois shores?

A. The average of nitrites from October 1st to 10th on the Missouri shore was .0011; on the Illinois shore it was .0064.

Q. Have you the records of analyses of water made by you at the same points opposite the intake on the Missouri and Illinois shores in the year later in October and November, 1901?

A. Yes sir.

Q. Have you a copy of that?

A. I have one (producing paper). This is a table showing
the nitrites in October and November, 1901, in water ex-
1662 amined first opposite the intake on the Missouri shore
and second opposite the intake on the Illinois shore corresponding to the same points of examination as stated in the last table No. 9, and is table No. 10.

Nitrites.

Date (1901)	Missouri Shore Pts. per Million	Illinois Shore Pts. per Million.
Oct. 1- 7	.0024	.0110
" 7-14	.0027	.0124
" 14-21	.0057	.0144
" 21-28	.0048	.0160
" 28-Nov.4	.0082	.0123
Nov. 4-11	.0124	.0167
" 11-18	.0141	.0177
" 18-25	.0096	.0171
" 25-30	.0128	.0170

Q. I show you here the plate No. 6, please describe it so
1664 that one looking at it can tell what it means (handing
paper to witness)?

A. Plate No. 6 shows a curve giving the variations in the amount of nitrites at the Illinois shore opposite the Chain of Rocks and this table is made by marking off the weeks in a horizontal line at the bottom of the page and the amounts of nitrites in a vertical line on the left hand side and the points obtained for each week are connected with a red line and this red line is the curve showing the variation in the quantity of nitrites at the Illinois shore during the time of the analyses and this other plate 5 was made in the same way and shows the variation in the amount of nitrites at the Missouri shore at the Chain of Rocks.

Q. And these two plates were made to illustrate the examinations as disclosed in table No. 9?

A. Yes sir, the 1900 table.

Q. Of water analyzed opposite the intake on the Missouri and Illinois shores?

A. Yes sir.

Complainant's counsel offer in evidence the plates referred to by the witness and they are marked by the Commissioner respectively "Complainant's Exhibits 27 and 28. Frank S. Bright, Commissioner."

Q. Now, with reference to the table showing the amount of nitrites found in 1900 and 1901, first on the Missouri shore opposite the intake of our Water Works and second on the Illinois shore opposite said intake what, if anything, is disclosed as to the relative amount of nitrites on either side of the Mississippi River at that point?

A. Well, it will be seen that the nitrites in January are nearly twice as great on the Illinois side of the river as 1665 on the Missouri side. Soon after the beginning of the work it showed twice as great on the Illinois side as the Missouri side. They begin to approach one another in February.

Q. In point of numbers?

A. Yes sir, they are about equal in March but in April the quantity on the Illinois shore is twice that on the opposite side and this increase was maintained throughout the summer and it became six times as great in September and October, 1901.

Q. Do you know whether or not there was any rise in the Illinois river in February, 1900?

A. In February, 1900, there was a rise in the Illinois river coincident, I think, with the coming down of the water of the Drainage Canal.

Q. What was the condition of the Missouri and Mississippi rivers at that time as to the stage of water, high or low?

A. I have not the figures here as to the stage of the river.

Q. But from your recollection, I do not mean the Government stages, from your knowledge of the streams at that time?

A. The Missouri was low and the Mississippi river was low.

Q. Do you know whether the Missouri and Mississippi at the time of the rise in the Illinois river were frozen?

A. I don't remember whether they were or not.

Q. This would make then what condition with reference to pure or impure water on the eastern and western side of the Mississippi River opposite the intake during the period of time mentioned in 1900, and 1901?

A. During the period that we made the analyses there at the eastern shore of the river, the Illinois side of the river at the water works, the water was from four to five times more polluted than the water on the Missouri shore as shown by these nitrites, by the quantity of nitrites.

1666 Q. Now, was there during this period in 1900, a mixture of the water of the Mississippi and Missouri Rivers at the intake?

A. From the fact that the amount of nitrites in the reservoir was greater than that in the Missouri River on the Missouri shore and less, somewhat, than that on the Illinois shore we naturally conclude that it was a mixture of the two waters, in fact not only the nitrites but all of our determinations showed that the water taken in at the intake is a mixture of those two waters. The chemical analyses indicate that the water on the eastern shore at the Intake Tower is Mississippi River water and the water on the western shore is Missouri River water.

Q. Now, from the averages obtained from your analyses made in October and November, 1901, what would you say as to whether or not the condition of the river on the Illinois shore opposite the intake in the Mississippi River was more or less polluted than it was before the opening of the Drainage Canal?

A. In January, 1900, the average amount of nitrites was .013 and in February it went up, this is on the Illinois shore, to .0187, and it came down somewhat in March but it went up very high in April, .308, and gradually came down during the summer, but throughout the entire summer it was from four to five times as great as on the Missouri shore.

Q. Do you know what in September, 1901, the average value of the nirites was that was found?

A. They are stated in the table, the results of the chemical analyses are in weights.

Q. You have the figures there?

A. I have not for 1900. The average value of the nitrites was .0068 in 1900; in September, 1901, it was .0125, nearly twice as much.

Q. Did you make any analyses of the water from Bellefontaine on the Missouri River?

1667 A. Yes sir.

Q. Comparing that analysis with the analysis at the point opposite the intake on the Missouri shore what does it disclose as to whether or not the water running along at the point where you took the samples on the Missouri shore opposite the intake is Missouri or Mississippi River water?

A. The analysis shows it is Missouri River water.

Q. Did you make any analysis at Hartford?

A. Yes sir.

Q. Where is Hartford?

A. It is on the Illinois side of the river nearly opposite the mouth of the Missouri.

Q. What character of water did the analysis show was running opposite Hartford at the point where you took the samples?

A. The analysis showed that was Mississippi River water.

Q. Did you make any chemical test to determine the difference in the sanitary character of the water on the two sides of the river at the Chain of Rocks by determining the amount of free ammonia and nitrates?

A. Yes sir.

Q. Have you the table?

A. I have a table showing the average of free ammonia on each side of the river at the Chain of Rocks (producing same).

Q. Made in 1900?

A. Yes sir, this is the table showing the average of free ammonia on each side of the river at the Chain of Rocks, and is table No. 11.

1668 The following tables give the weekly average of Free Ammonia on each side of the river:

Date (1900)	Missouri Shore		Illinois Shore	
Jan. 24-31	.1208)	Jan. average .1208	.4920)	Jan. average .4920

1670 Q. Will you give me the average of free ammonia found in the water on the Missouri and Illinois shore from January 24th to 31st?

A. The average amount of free ammonia found during the week from January 24th to 31st, 1900, on the Missouri shore was .1208.

Q. What was it on the Illinois shore?

A. On the Illinois shore for the same period of time it was .4920.

Q. Will you please give us the maximum amount of free ammonia found on the Missouri and Illinois shore and then the average for the Missouri shore and Illinois shore of free ammonia?

A. The maximum amount on the Missouri shore during February occurred during the week from February 1st to 7th and was .2200; the average amount on the same shore, the Missouri shore, was .1673; the maximum amount on the Illinois shore occurred in February in the week from the 14th to the 21st and amounted to .4820; the average amount for February was .4180.

Q. Please give me the same figures for the month of March, 1900?

A. In March the maximum amount of free ammonia on the Missouri shore occurred during the week of March 14th to the 21st, and the amount of free ammonia was .1731; the average amount for the month on the Missouri shore was .1457; on the Illinois shore the maximum amount of free ammonia for the month of March occurred during the week of March 21st to the 28th and the amount was .3060; the average amount for the month of March on the Illinois shore was .2981 parts of free ammonia per million of water.

Q. Please give me the same figures in April?

A. The maximum amount of free ammonia on the Missouri shore for the month of April occurred in the week of April 1st to 7th; the amount was .0828; the average for the month of April on the Missouri shore was .0609; the maximum amount on the Illinois shore occurred April 1st to 7th; the amount was .2930; the average for April on the Illinois shore was
1671 .1770 parts of free ammonia per million of water.

Q. Give me the same figures for May?

A. The maximum amount of free ammonia on the Missouri shore in May was found in the week of May 21st to 28th and the amount was .0871 parts of free ammonia; the average for the month of May was .0614 for the Missouri shore; for the Illinois shore the maximum amount was found in the week of

May 21st to 28th and it amounted to .0685; the average of May was .0566.

Q. Please give me the same figures for June?

A. The maximum amount of free ammonia on the Missouri shore occurred in the week from June 21st to 28th and the amount was .0648; the average for June on the Missouri shore was .0416; the maximum amount found on the Illinois shore in the month of June was in the week of June 1st to 7th and it amounted to .0351; the average for the month of June was .0267.

Q. Give me the same figures for July.

A. For the Missouri shore the maximum amount was found in the week of July 21st to 28th, and the amount for that week was .0708; the average for July on the Missouri shore was .0504; the maximum amount found on the Illinois shore occurred in the same week, July 21st to 28th, and amounted to .0388; the average for the month of July was .0291.

Q. Give it to me for August?

A. For August on the Missouri shore the maximum amount was found in the week of August 21st to 28th; it amounted to .0525; the average amount for August was .0322; the maximum amount for August on the Illinois shore was .0428 and it occurred in the first week, August 1st to 7th; the average amount for August was .0304.

Q. Please give it to me for September.

A. For September the maximum amount occurred in the
week of September 14th to 21st; it amounted to .0628 on
1672 the Missouri shore; the average amount for September on
the Missouri shore was .0454; the maximum amount found
on the Illinois shore for September was during the week of September 21st to 28th; it amounted to .0768; the average for that month was .0484.

Q. Please give me the average from October 1st to October 10th, 1900?

A. On the Missouri shore the average from October 1st to October 10th was .0508 and for the Illinois shore it was .0448.

Q. Here are plates 7 and 8, please explain what they are and let them be marked?

A. Plate 7 shows a curve giving the variations in the amounts of free ammonia at the Missouri shore at the Chain of

Rocks. The time is laid off in a horizontal line at the bottom and the amount of free ammonia is laid off in a vertical line at the left hand side; the weekly points obtained by laying off the amounts are connected with a red line and this curve shows the variation in the amount of free ammonia at the Missouri shore at the Chain of Rocks.

Complainant's counsel offer in evidence plate No. 7 referred to by the witness and the same is marked by the Commissioner "Complainant's Exhibit 29, Frank S. Bright, Commissioner."

The Witness: This plate No. 8 shows the same thing for the Illinois shore at the Chain of Rocks.

Complainant's counsel offer in evidence plate No. 8 referred to by the witness and the same is marked by the Commissioner "Complainant's Exhibit 30. Frank S. Bright, Commissioner."

Q. These two plates disclose the opposite sides of the river at the same point?

A. Yes sir.

Q. Showing free ammonia?

A. Free ammonia.

Q. Did you make an examination chemically to determine the average quantities of free ammonia found on each side of the river opposite the intake tower of the St. Louis Water
1673 Works in October and November, 1901?

A. I did.

Q. Please present the table?

A. This is the table (producing paper) showing the average quantities of free ammonia found on each side of the river opposite the intake tower of the St. Louis Water Works in October and November, 1901, and is table No. 12.

1674 The average quantities of free ammonia found on each side of the river in October and November, 1901, are as follows:

1901	Missouri Shore.	Illinois Shore.
Oct. 1- 7	.0805	.0869
" 7-14	.0520	.0571
" 14-21	.0449	.0706
" 21-28	.0449	.0557
" 28-Nov. 4	.0717	.0957

1901	Missouri Shore.	Illinois Shore.
Nov. 4-11	.0634	.0714
" 11-18	.0894	.0720
" 18-25	.0810	.0489
" 25-30	.0844	.0648

1675 Q. From the above tables chemically which side of the river is shown to contain nitrogen in the form of free ammonia in the greatest quantity?

A. These tables show that much larger quantities of free ammonia are found on the Illinois side of the river during the months of January, February, March and April; during the remaining months both sides are practically alike as regards this form of nitrogen.

Q. How was it in October and November, 1901, as to the amount of nitrogen as free ammonia on either side of the river?

A. The analyses made in 1901, show the quantity of free ammonia was greater on the Illinois shore than on the Missouri shore.

Q. Now, did you make a chemical analysis to determine the proportion of nitrates in 1900, at either side of the Mississippi river opposite the Chain of Rocks?

A. Yes sir.

Q. Have you got that table?

A. I have (producing same). This is a table beginning January 24th, 1900, and ending October 11th, 1900, showing the nitrates first on the Missouri shore opposite the Intake and second on the Illinois shore opposite the Intake, and is table No. 13.

1676 The following are the weekly averages of nitrogen in the form of nitrates obtained at the two sides of the river at the Chain of Rocks:

Date (1900)	Missouri Shore.		Illinois Shore.	
Jan. 24-31,	.565)	Jan. average	1.040)	Jan. average
	)	.565	)	1.040
Feb. 1- 7,	.457)		.765)

Q. Now will you give me the average nitrates on the 1678 Missouri shore from January 24th to 31st, 1900, and on the Illinois shore opposite the same point from January 24th to 31st, 1900?

A. January 24th to 31st, in 1900, the average amount of nitrogen as nitrates on the Missouri shore was .565, and on the Illinois shore for the same time was 1.040.

Q. Now, will you please give me the maximum amount for the month of February of nitrates on the Missouri shore and also on the Illinois shore, together with the monthly average of nitrates on each shore opposite the Intake Tower of the St. Louis Water Works?

A. The maximum amount was found February 14th to 21st. The average for that week on the Missouri shore was .542, and the average for the month of February on the Missouri shore, was .485. On the Illinois shore the maximum amount was found to be during the week February 14th to 21st, and the amount was .822, and the average for February for that shore was .790.

Q. Now, please give me the same figures for March.

A. For March the maximum amount occurred during the week March 7th to 14th on the Missouri shore and the amount was 1.343. The average amount for March on the Missouri shore was .935. The maximum amount on the Illinois shore for the month of March occurred in the first week, March 1st to 7th, and the amount was 1.205. And the average for the month of March on the Illinois shore was 1.004.

Q. Now, please give me the same figures for April.

A. The maximum amount of nitrates was found in the first week of April, on the Missouri shore, April 1st to 7th, and the amount was .577. The average for April on the Missouri shore was .478. The maximum amount found during April on the Illinois shore was in the week April 7th to 14th, and it amounted to 1.022. And the average for April was .936.

1679 Q. Now, please me give the maximum amount of nitrates found at the two points, on the Missouri and Illinois shore respectively in May, together with the monthly average?

A. The maximum amount in May on the Missouri shore was found in the week of May 1st to 7th, and the amount was .594. The average for the month of May on the Missouri shore was .455. The maximum amount for May on the Illinois shore was .600. This occurred in the first week, May 1st to 7th. The average amount for May on the Illinois shore was .435.

Q. Now, please give me the same figures for the ensuing month of June at the two points—both shores of the Mississippi?

A. The maximum amount in June was found in the week June 21st to June 30th, on the Missouri shore and the amount was .474. The average for June on the Missouri shore was. 364. The maximum amount for the Illinois shore for the month of June, occurred in the week June 21st to 30th, and amounted to .494. The average for June was .435 parts of nitrogen as nitrates per million.

Q. Now, please give me the same figures for the next month, July, 1900?

A. For July, 1900, on the Missouri shore the maximum quantity of nitrates found occurred during the week of July 21st to 28th. It amounted to .651 parts per million. The average for July on the Missouri shore was .483. The maximum amount on the Illinois shore for July occurred in the week July 21st to 28th, and amounted to .788. The average for July on the Illinois shore was .581.

Q. Please give me the same figures for August?

A. The maximum amount of nitrates at the Missouri shore during the month of August occurred in the week August 1st to 7th. The amount found was .491. The average for 1680 the month of August for the Missouri shore was .345. The maximum amount for the Illinois shore for the month of August, 1900, was found in the week August 21st to 28th. It amounted to .622, and the average for the month of August for that shore was .419 parts of nitrogen per million.

Q. Please give me the same figures for September.

A. For the Missouri shore in September, 1900, the maximum amount of nitrates was found in the week September 21st to 28th, and the amount was .480. The average for September was .358. The maximum amount for the Illinois shore in the month of September, 1900, was .505, occurring in the week September 7th to 14th. The average amount for September was .433.

Q. Now, please give me the average for the time from

October 1st to 10th, 1900, at the two points on the Mississippi's shores.

A. The average amount on the Missouri shore for October 1st to 10th, 1900, was .617, and on the Illinois shore for the same time was .388 parts of nitrogen per million of water.

Q. Now have you any record of the parts of nitrogen in the form of nitrates as found by your chemical examinations of the waters opposite the intake of the St. Louis Water Works in October and November, 1901?

A. I have.

A. The weekly averages of nitrogen in the form of nitrates
1681 found in October and November, 1901, are as follows:

	1901 Missouri Shore	1901 Illinois Shore
Oct. 1- 7	.428	.485
" 7-14	.428	.291
" 14-21	.240	.269
" 21-28	.377	.331
" 28-Nov.4	.400	.360
Nov. 4-11	.234	.497
" 11-18	.257	.257
" 18-25	.260	.291
" 25-30	.184	.223

1682 Q. Now I show you here plates 9 and 10, and ask you to indicate what they are.

A. Plates 9 and 10 contain curves giving the changes in the amount of nitrates at the Missouri shore and at the Illinois shore, Chain of Rocks.

Q. At opposite points on the Illinois and Missouri shores of the Mississippi river?

A. Yes, sir.

Complainant's counsel offer in evidence charts referred to and the same are marked by the Commissioner respectively "Complainant's Exhibits 31 and 32. Frank S. Bright, Commissioner."

Q. Now on which side of the river do these tables last mentioned show the more nitrates?

A. There were more nitrates as a rule on the Illinois shore than on the Missouri shore.

Q. Now considering all the facts heretofore set out, with reference to your chemical work on the waters of the Mississippi river at points mentioned, the Intake Tower and points opposite the Intake Tower on the Missouri and Illinois shores of the Mississippi river, on which side of the river is the water most polluted from a chemical standpoint?

A. On the Illinois side.

Q. Now, in regard to the sanitary character of the water, which side of the river at this point is the better water, on the Missouri shore or the Illinois shore?

A. The Missouri shore.

Q. Now, on the Illinois shore, the waters of what river were found, according to your chemical analyses?

A. The chemical analyses showed that the water on the Illinois shore of the Mississippi river, is Mississippi river water.

Q. Now, on the Missouri shore what waters, or the waters of what river, are found?

A. The chemical analyses show that the water on the Missouri shore is the Missouri river water.

Q. Now, you determined the character of the water as to whether it is Missouri river water or Mississippi river water by the chemical tests which you applied?

A. Yes, sir.

Q. Now, the reservoir water of this city in the reservoirs up there at the Chain of Rocks, what are they, Missouri and Mississippi river water mixed, or are they the Missouri river water or the Mississippi river water, as disclosed by your chemical examinations?

A. The chemical analyses of reservoir water showed that the water in the reservoir is a mixture of these two waters. This is clearly shown by all of the data that we have, both for free ammonia, and albuminoid ammonia, and nitrates and nitrites and chlorine, and solid matter, all the data show that the water in the reservoir is a mixture of Mississippi river water and Missouri river water.

Q. How do you draw that deduction?

A. We reach that conclusion from the facts that the values obtained for these different quantities, namely, chlorine and solid matter, and free ammonia and albuminoid ammonia, in every case are a mean between the values obtained for the Mississippi side of the river, the water from the Illinois side, and the water obtained from the Missouri shore.

Q. Now, from a sanitary standpoint, what is the better water, that in the reservoir of this city at the intake or that of the Illinois shore opposite the Intake?

A. The reservoir water is better than the water from the Illinois shore opposite the Intake.

1684 Q. And from a sanitary standpoint is the water in the reservoir as good or better than the water of the Mississippi river on the Illinois shore opposite the intake?

A. It is better than the water on the Illinois shore.

Q. Now, the water in the reservoir of this city as compared to the water on the Missouri shore opposite the Intake, is it better or worse from a sanitary standpoint?

A. It is worse.

Q. Now, did you prepare any formula for calculating the proportions of the Missouri and Mississippi river waters that were present in the reservoir of this city?

A. I did.

Q. Chemically?

A. I did.

Q. Will you just describe that?

A. In order to determine exactly what proportions of each of the two waters are present in the reservoir water, I have, by two simple equations, calculated the amount at different times. These equations are as follows:

Let X represent the fractional part of the reservoir water that comes from the Missouri river, and Y equal the fractional part of the reservoir water that comes from the Mississippi river. Then let A represent the value of the nitrites, for example, in the Missouri water, and B equal the value of the nitrites in the Mississippi water, and C equal the value of the nitrites in the reservoir water, then X plus Y—

Q. Well, X plus Y meaning, Missouri and Mississippi river water?

A. Yes, X, the fraction consisting of the Missouri water plus Y, the fraction of Mississippi water, must equal 1.

Q. Or the water in the reservoir?

A. Or the water in the reservoir, also A—

Q. Now just explain what A means?

A. A, the value of the nitrites found in the Missouri water multiplied by the quantity of Missouri river, or the fractional part of Missouri water, AX, plus BY, in which B is the value of the nitrites in the Mississippi river water, multiplied by 1685 the fractional part of the reservoir water, giving us BY; the sum of these two quantities, AX plus BY must equal C, which is the value of nitrites found in the reservoir water.

Q. Now, that is the formula or basis for your—

A. Now, by means of these two equations, and the analytical data that have been given in the tables, the proportions of each of the waters in the reservoir can be calculated. Shall I give an example?

Q. Yes.

A. For example; in the week ending August 21st, the value of the nitrites were as follows:

A equaled .0014; that was the value of the nitrites on the Missouri shore on that day, and B equaled .0102. That was the value of the nitrites on the Illinois shore—

Q. In the Mississippi river?

A. In the Mississippi river water. The C equaled .0035. That was the value of the nitrites found in the reservoir water on the same day. Now substituting these values in the above equations, we get first: X plus Y equals 1, and then .0014X plus .0102Y equals .0035 or .0014X plus .0102 into (1 minus X) equals .0035. Now then .0088X equals .0067, and X equals .0067 divided by .0088, which equals ¾ very nearly. That is, during this week ¾ of the reservoir water came from the Missouri shore, or was Missouri river water, the remaining ¼ was Mississippi river water.

Q. Now, by applying that method, can you determine the proportion of each of the waters, that constitute the reservoir water daily?

A. Yes sir.

Q. Do those proportions vary from day to day?

A. They vary from day to day.

Q. What was the stage of the river as to whether it was high or low—the Missouri river and the Mississippi river at the time that you took to illustrate your algebraic equation
1686 there, August 21st?

A. Well, at this time the Missouri was high.

Q. And what was the stage of the Mississippi?

A. The Mississippi was lower.

Q. Can you determine from your chemical analyses whether or not the reservoir water is ever entirely free from the Mississippi river water?

A. As far as analyses enable me to judge, there would always be some of the Mississippi river water there.

Q. In the reservoir?

A. Yes, because it stands in the settling basins for several days and there is a constant mixture there of the two waters, so that although for a single day or perhaps two days the water would be largely Missouri river water, when it comes into the reservoir it mixes with the previous water contained there, which was Mississippi river water.

Q. Then in your judgment from a chemical standpoint, there is always more or less Mississippi river water coming into the Intake with the Missouri river water?

A. Yes sir.

Q. And consequently there must be more or less of it all the time in the reservoir?

A. Yes sir.

Q. Now, did you make any chemical analyses to determine whether or not the Mississippi river water was more polluted as you ascended it?

A. Yes sir.

Q. Now, above the mouth of the Illinois, is the Mississippi in a better or a worse condition than below the mouth of the Illinois?

A. Well, my analyses show that as we go up the Mississippi river, we find the water is badly polluted until we get above the mouth of the Illinois. Above the mouth of the Illinois the Mississippi is in a very much better condition.

Q. Now, how does the water of the Missouri river at Bellefontaine compare with the water of the Mississippi river above the mouth of the Illinois as to being wholesome?

A. They are both fairly good streams from a sanitary standpoint.

1687 Q. At those places?

A. At those places.

Q. Did you determine from your chemical analyses the source of the pollution of the Mississippi river below the mouth of the Illinois?

A. Chemical analyses were made of daily samples of water not only at the Illinois shore, Chain of Rocks, but also at Hartford and at Alton and in the Illinois river above Grafton, and in the Mississippi river above Grafton, and we found that the weekly average of nitrites were higher at Hartford than at the Illinois shore, Chain of Rocks. They were higher again at Alton and, as we go up the stream, we find they were higher in the Illinois river above Grafton; but they were very much lower in the Mississippi river above Grafton.

Q. Lower than what?

A. Lower than at any of the points.

Q. Well, name the points that they were lower than?

A. The nitrites in the Mississippi river above Grafton were lower than the nitrites in the Illinois river above Grafton, and also the nitrites at any subsequent places in the Mississippi below Grafton, namely, at Alton, and at Hartford, and at the Illinois shore, Chain of Rocks.

Q. Well, how about the Missouri shore at the Chain of Rocks?

A. The nitrites are quite low at the Missouri shore, Chain of Rocks.

Q. How about the nitrites in the Mississippi river between Grafton and the Intake Tower of the waterworks, and the nitrites in the river at the Intake Tower, as compared with the nitrites in the Mississippi river above the mouth of the Illinois?

A. They are lower above the mouth of the Illinois, the nitrites are considerably higher just below the mouth of the Illinois.

Q. Well, the nitrites above the mouth of the Illinois, in the

Mississippi are higher or lower than the amount of nitrites at the waterworks?

A. They are lower.

1688 Q. And they are less—there are less nitrites in the upper Mississippi?

A. There are less nitrites in the upper Mississippi—

Q. Above the mouth of the Illinois?

A. Yes. Than at our intake.

Q. Now did you make, from your chemical analyses a table disclosing the weekly and monthly averages of nitrites found on the Illinois shore at the Chain of Rocks and at Hartford, and at Alton?

A. Yes sir.

Q. Now please present this table.

A. This is a table, beginning January 24, 1900, and extending to October 11, 1900, showing the nitrites on the Illinois shore, at Alton above the sewage of the city and above Hartford—above the sewage of the city. This is table No. 14.

1689 Weekly and monthly averages of nitrites found at the Illinois shore, Chain of Rocks, the nitrite averages at Hartford and at Alton:

Date (1900)	Illinois Shore		Hartford		Alton

1691 Q. Now, please give me the maximum nitrites on the Illinois shore for the period January 24th to 31st, for Illinois shore, opposite the Intake, and then at Hartford and at Alton?

A. January 24th to 31st, Illinois shore opposite Chain of Rocks, .0130. Hartford is the next city going up the river and is .0183 nitrites, and Alton, still further up, .0225.

Q. Now please give me the maximum amount of nitrites found in the month of February: First at the point on the Illinois shore opposite the Chain of Rocks, second at Hartford, Illinois, and third at Alton, Illinois, above the sewage of the city, together with the monthly averages at those three named places?

A. The maximum amount in February occurred in the week February 1st to 7th. It amounted at the Illinois shore, Chain of Rocks, to .0214. The average for that month at the same place was .0187. The maximum at Hartford occurred in the week February 21st to 28th, and amounted to .0248. The average for that month at Hartford was .0199. The maximum at Alton for February occurred in the week February 21st to 28th, and amounted to .0334. The average for February at Alton was .0253.

Q. Please give me the same figures for the same points for the month of March, together with the averages?

A. The maximum amount at the Illinois shore, Chain of Rocks, for the month of March occurred in the week March 21st to 28th, and amounted to .0200. The average for March at that place was .0164. The maximum amount for March at Hartford occurred in the first week, March 1st to 7th, and it amounted to .0234. The average for March at Hartford was .0173. The maximum amount for March at Alton occurred in the first week, March 1st to 7th. It amounted to .0365. The average for March at Alton was .0248.

Q. Please give me the same figures for April, 1900, at
1692 those points?

A. For April the maximum occurred in the first week of April, April 1st to 7th, at the Illinois shore, Chain of Rocks, and amounted to .0365. The average for April, Illinois shore, Chain of Rocks, was .0308. At Hartford for April the maximum occurred in the last week, April 21st to 28th and it amounted to .0431. The average for April at Hartford was .0358. At Alton the maximum occurred in the last week of April, April 21st to 30th, and amounted to .0485. The average for the month of April at Alton was .0378.

Q. Now, please give me the same figures for May.

A. For May, first, Illinois shore, Chain of Rocks, the maximum occurred May 21st to 28th, and amounted to .0178. The average for May at the Illinois shore, Chain of Rocks was .0154. At Hartford, during the month of May the maximum occurred in the week May 14th to 21st, and it amounted to .0340. The average for May at Hartford was .0269. For Alton the maximum in May at Alton occurred in the week May 14th to 21st and amounted to .0388. The average for May at Alton was .0289.

Q. Now, please give me the same figures for the same points for June?

A. The Illinois shore, Chain of Rocks, the maximum in June occurred in the week June 21st to 28th and amounted to .0084. The average for June, Illinois shore, Chain of Rocks, was .0650. For Hartford the maximum amount was found June 21st to 28th, and amounted to .0225. The average for June at Hartford was .0099. The maximum for June at Alton occurred June 21st to 28th, and it amounted to .0243. And the average for June at Alton was .0104.

Q. Now, please give me the same figures for July?

A. First, Illinois shore, Chain of Rocks, the maximum
amount in July occurred in the week July 7th to 14th, and
1693 also in the subsequent week—in the next week, was .0043.
The average for July at that place was .0041. The maximum at Hartford for July was .0143 in the week July 21st to 28th. The average was .0121. The maximum at Alton occurred in the week July 14th to 21st and amounted to .0177. The average for July was .0159.

Q. Please give me the same figures for the month of August at the same points?

A. First at the Illinois shore, Chain of Rocks, the maximum in August, 1900, occurred in the week August 14th to 21st and amounted to .0102. The average for August at that place was .0063. For Hartford for the same month the maximum occurred in the week August 14th to 21st, and amounted to .0173. The average for the month at Hartford was .0095. At Alton the maximum amount found in August was during the week August 14th to 21st, and amounted to .0180. The average for August at Alton was .0104.

Q. Please give me the same figures for September at the same point.

A. First the Illinois shore, Chain of Rocks, for the month of September, 1900, the maximum amount was found September 7th to 14th, and amounted to .0071. The average for September at that place was .0068. At Hartford during the period of September, the maximum amount occurred in the week September 21st to 28th, and amounted to .0120. The average for the month of September at Hartford was .0097: At Alton the maximum occurred in September during the week September 21st to 28th, and amounted to .0134. The average for September at Alton was .0115.

Q. Please give me the amount from October 1st to October 10th?

A. From October 1st to 10th, at Illinois shore, Chain of Rocks, the average amount of nitrogen as nitrites was .0064. At Hartford at the same time it was .0101. At Alton it was .0124.

1694 Q. Now, did you make a chemical analysis of the water at these same points on the Illinois shore for October and November, 1901, to determine the quantity of nitrites present?

A. I did.

Q. Please read that table.

A. The table is as follows: 1901.

Date.	Illinois shore, Chain of Rocks.	Hartford.	Alton
October 1 to 7	.0110	.0235	.0160
October 7 to 14	.0124	.0184	.0121
October 14 to 21	.0144	.0150	.0180
October 21 to 28	.0160	.0163	.0190
October 28 to November 4	.0123	.0137	.0102
November 4 to 11	.0167	.0191	.0103
November 11 to 16	.0177	.0190	.0124
November 18 to 25	.0171	.0167	.0072
November 25 to 30	.0170	.0186	.0088

Q. Now, from these figures, where are the nitrites greater along the Mississippi river, as we ascend it from a point opposite the Chain of Rocks?

A. These averages show that with very few exceptions the nitrites were higher at Hartford than they were at the Illinois shore, Chain of Rocks, and they were higher at Alton than they were at Hartford.

Q. Now, is the Mississippi river above Alton more or less impure than it is at Hartford, below Alton?

A. It is more impure.

Q. Where is Hartford?

A. Hartford is opposite the mouth of the Missouri river.

Q. How far below Alton?

A. I can give you the exact number of miles by looking on the map. Hartford is nine miles above the Intake and Alton is 23, that is 14 miles above Hartford.

Q. Alton is 14 miles above Hartford?

A. Yes, by river, that is.

Q. Yes sir, that is what I am talking about, by river.

A. Yes.

Q. Now, if that is true, that the Mississippi river above
Alton and below the mouth of the Illinois is more polluted
1695 than it is at Hartford, 14 miles below, what deduction, as
a chemist would you draw from that as to the effect of the
sewage of the city of Alton, on the waters of the Mississippi
river, as to whether or not it increased or diminished perceptibly
the pollution?

A. The sewage of Alton apparently has no effect upon the condition of the river at Hartford.

1696 Q. What is the reason of that?

A. Well, the volume of the river is so great that it is lost, or it is so small—

Q. Well, it is dilution, isn't it?

A. Its dilution is so great that it produces very little effect upon the character of the river as a whole.

Q. Now, what do the analyses in October and November, 1901, show comparatively for nitrites and the analyses of 1900, as to whether it was greater or lower in summer?

A. Well, it shows that the same conditions held in 1901, that we found in 1900; that the river is more impure as we ascend the stream.

Q. Well, was there more nitrites or less in 1901 than there was in 1900?

A. Our analyses show more.

Q. Now, going up to the mouth of the Illinois river, is there any difference shown by chemical analyses between the waters of the Illinois and the Mississippi above the mouth of the Illinois river near Grafton?

A. Yes sir.

Q. Well, are the nitrites higher or are they lower in the Mississippi above the mouth of the Illinois than they are in the Illinois above the mouth thereof?

A. My analyses show that the nitrites continually increase as we go up the river.

Q. What river?

A. Up the Illinois river.

Q. Well, that doesn't exactly answer my question. You say the nitrites are higher in the Illinois river above Grafton than they are in the Mississippi above Grafton?

A. Yes sir, they are higher in the Illinois river above Grafton, very materially higher.

Q. Well, are the nitrites in the Mississippi river above the mouth of the Illinois higher than they are at Alton and at Hartford and at the Chain of Rocks?

A. They are very much lower.

Q. Then is the Mississippi river above Grafton in a better or worse sanitary condition than it is below Grafton and at the Chain of Rocks? 1697

A. Very much better.

Q. Well, from your examinations can you state chemically whether or not the Illinois river pollutes the Mississippi river?

A. The chemical analyses show that the pollution of the Mississippi comes from the Illinois river.

Q. Now, if it were not for that pollution by the Illinois river, how would the water of the Mississippi river at the Intake or at the point opposite the Intake, compare with the water on the Missouri side of the Mississippi opposite the Intake?

A. It would be very similar in character as to the free ammonias and nitrites. The waters would be almost the same and there would be a higher chlorine found on the Missouri shore than on the Illinois shore, for the reason that the Missouri river always contains a larger quantity of chlorine—chlorides, than the Mississippi, but from a sanitary standpoint, the water from the Mississippi river above the mouth of the Illinois, is very similar to the water of the Missouri river, and were it not for the inflow of the waters of the Illinois river, the Mississippi on both sides of the river at the Chain of Rocks, would be of equal sanitary character. It would be a good drinking water on both sides. As it is now, the Illinois comes in and carries with it the nitrogenous organic matter which we find in the river at Grafton and at Alton and at Hartford, and on the Illinois shore at the Chain of Rocks.

Q. Do you know whether or not the Mississippi river above its confluence with the Missouri, and the Missouri above its confluence with the Mississippi, run through practically the same kind and class of agricultural region and whether or not the land in the drainage area of those two rivers for the first thousand miles of each stream is practically used for the same
1698 purpose by a similar class of people?

A. I belive it is.

Q. Have you any data as to the rain precipitation in the drainage area of the Missouri above its confluence with the Mississippi and the Mississippi above its confluence with the Missouri?

A. I have no data here.

Q. Have you ever investigated that question to see in which watershed the greater amount of rain precipitation occurs?

A. I have never investigated.

Q. Can you get that data?

A. I think I can.

Q. Now, I show you here a map which you have marked Plat No. 12. Will you please state what that is and explain the things that are found on the map in order that one examining it may be able to tell what those lines and marks indicate?

A. This map is intended to show the variation in the quantities of nitrites found in the Illinois River at a point above Grafton, and also at another point above Peoria.

The horizontal line on this map, or on the horizontal line the time is measured, and on the vertical lines on the left hand side of the map the amounts of nitrites in parts per million are measured. There are two curves on this map, one curve showing the variation in the amount of nitrites in the Illinois River above Grafton. This curve is made by plotting the weekly averages found by analyses, and then joining these points with a red line, or—I should say the monthly averages. It is made from the monthly averages, and joining these points with a red line.

The lower curve gives the average amount of nitrites at a point above Grafton in the Illinois River.

The upper curve gives the amount of nitrites in the Illinois River at a point above Peoria, throughout the time of our analyses, extending from January 24th to October 11th, 1900.

1699 Complainant's counsel offers the map referred to in evidence and the same is marked by the Commissioner "Complainant's Exhibit No. 33. Frank S. Bright, Commissioner."

Q. Now, did you make an analysis of the Illinois River above Grafton?

A. Yes sir.

Q. Now, what do those analyses show with reference to increase or decrease of nitrites and other nitrogenous substances indicating sewage pollution as you ascend the Illinois River?

A. Comparing the values found for nitrites and also free ammonia, the value found for these substances at Grafton with the same values found at a point above Alton, we find higher values, uniformly above Grafton, than we do at Alton, showing that as we ascend the Illinois River the impurities constantly increase.

Q. Now, did you make any analysis at Peoria—make any analysis of the water?

A. Yes, we have tabulated the daily analyses of the waters taken at Peoria.

Q. Now, what do the sepcimens analyzed from Peoria show with reference to whether or not they are polluted, and how do they compare with the water at Joliet and at Lockport?

A. We find that at Peoria the amout of pollution was very great and as we go up still further to Joliet and Lockport the analyses showed that the water is simply sewage, and the analyses there for free ammonia and nitrites are such as one obtains by analyzing sewage.

Q. Now, when you began in January, 1900, to analyze these waters, did you analyze any from Peoria?

A. Yes sir.

Q. Now, was the nitrite greater or less in the samples an-analyzed when you first began in January, 1900, at Peoria, than it

was at Grafton, in other words, was there more or less nitrites in
the water analyzed in the samples taken January 24th,
1700 from Peoria than there was in that taken from Grafton?

A. At first we found less nitrites at Peoria than we did at Grafton, in January.

Q. Now, after the opening of the Drainage Canal did the nitrites at Peoria increase or decrease?

A. They increased.

Q. Now, how did they compare after the opening of the Drainage Canal with the nitrites found at Grafton? Were they greater or less in number?

A. They were greater.

Q. Now, from these chemical facts, what conclusion do you draw?

A. I conclude from these analyses that before the opening of the Drainage Canal there was sewage matter in the waters of the Illinois River, but there was greater oxidation in the region above Peoria and immediately below Peoria—all along the river there was greater oxidation. That was shown by diminution.

Q. Greater oxidation than there was after the opening of the canal?

A. Yes sir, the sewage above Peoria.

Q. Why was that?

A. Well, it moved more slowly.

Q. Now does the rapidity of the current have any effect on the oxidation?

A. I should say that it retarded it, if anything.

Q. Now what were you going to say about the sewage above Peoria?

A. Well, before the opening of the canal, the movement was slower and while the water was impure above Peoria, we found a smaller quantity of nitrites there, showing that the oxidation had proceeded further, and then after the opening of the Drainage Canal the quantity of nitrites at Peoria increased enormously, and they kept on increasing throughout the time that we made these analyses, and from that I conclude that the effect of the opening of the Drainage Canal was to wash these oxidized materials further down the river. The region of bacterial action, and the conversion of the nitrogenous organic mat-

ter into nitrites was moved much further down the Illi-
1701 nois River and into the Mississippi River below the mouth of the Illinois.

Q. Now, did this large increase in the number of nitrites found in the chemical analyses of the water obtain in the waters above Peoria?

A. The nitrites increased all the way up.

Q. Up to where?

A. Up to Lockport.

Q. The point of entrance in the Des Plaines River of the Chicago Canal?

A. Yes sir.

Q. Now, that was the analysis made in 1900?

A. In 1900.

Q. Now, the analysis made a year later, in 1901, did that tend to disclose the same state of affairs?

A. In 1901, the analyses showed that the same state of affairs still existed. The quantities of nitrites found above Peoria were still very considerably greater than the nitrites found in the Illinois River above Grafton.

Q. Now, do you know whether these samples were taken at Peoria or two or three miles above Peoria?

A. I understood that they were taken above Peoria, three miles.

Q. Now with reference to your figures, is it disclosed whether or not the Illinois River above Grafton was more impure in 1901 than it was in 1900?

A. My analyses showed that the Illinois River above Grafton was more impure in 1901 than in 1900.

Judge Springer: You mean for the corresponding months?

A. For the corresponding months, yes—for October and November.

Attorney General Crow: Now, what was the condition of the Illinois river in 1901, as to whether it was high or low?

A. I think it was high. I am not sure.

Q. In 1901?

A. No, that was the drought year, that is true. I have not a record of the stages of the river.

Q. Well, we proved that the other day anyhow. Did you make any memorandum of your analyses, or table showing the monthly averages of nitrites and the free ammonia in the Illinois River above Grafton?

1702 A. Yes sir.

Q. Have you got that?

A. Yes sir, I have them here.

Q. Will you please give me the results of that, together with the dates to nitrites and free ammonia for the Illinois River above Grafton?

A. Illinois River above Grafton, January 24th to February 1st, 1900; the average amount of nitrites was .0300. Shall I give you the free ammonia at the same time?

Q. Yes, just put that in also.

A. And free ammonia for the same time was 1.498; then the monthly average for February, for nitrites was .0245, and for free ammonia was .946; the monthly average for March, nitrites, was .0170, and for free ammonia .322; For April the monthly average for nitrites was .0370, for free ammonia, .113; for May the nitrites, the monthly average was .0459; for free ammonia .1079; the monthly average for June in nitrites was .0193; free ammonia .0321; for July the monthly average of nitrites was .0352; free ammonia .0443; for August the monthly average for nitrites was .239; for free ammonia .0406; for September the nitrites, monthly average .0257; free ammonia .0517; October the nitrites .0428; free ammonia .0677.

Q. Now did you make any comparison of the Illinois River above Grafton for free ammonia and nitrites between October, 1900, and October, 1901,—that is, did you compare these two periods?

A. Yes sir.

Q. Have you got those figures?

A. I have the figures for 1901, on the large charts that I have.

Q. Well, I have got the two together right here. Examine them and see if they are correct, and if you made them?

A. Yes, these are correct; these are my figures. The Illinois River above Grafton in October, 1900, had nitrites .0428,

and in 1901, .0720; and free ammonia in October, 1900,
1703 was .0677; and October, 1901, .1502.

Q. Now, did you make any comparison of the figures from the result of your analyses, as to nitrites and free ammonia in the Illinois River above Peoria in the periods October, 1900, and October, 1901?

A. Yes sir.

Q. Please give them to me.

A. In October, 1900, the nitrites were .1857, and in 1901, they were .1240, and free ammonia, October, 1900, 1.404, and in 1901, .305.

Q. Now, comparing the amount of decomposed sewage in the Illinois River at a point above Peoria in January, 1900, with that supposed to be there in the early part of September and October 1900, as shown by your chemical analyses, what would you say were the relative proportions?

A. Is this above Peoria?

Q. Yes. Above Peoria.

A. It was very much greater.

Q. About how much?

A. Well eight or nine times as much.

Q. In September and October as compared with January, 1900?

A. Yes, that is shown by this red curve which constantly rises throughout that period.

Q. Well, now, can you state from your chemical analyses of these waters, whether or not the impurities coming down the Illinois River have been increased or diminished?

A. The impurities are somewhat diminished as they come down the Illinois River.

Q. No. Can you state whether or not they have been increased or diminished by the opening of the Canal?

A. Well, so far as my analyses go, there has been a decided increase since the opening of the canal in the amount of impurities that come down the Illinois River.

Q. Are these impurities sufficiently oxidized to be converted into harmless products by the time they reach the Mississippi River and the Intake Tower situated therein in this city?

1704 A. In my opinion they are not.

Q. As a chemist and from your chemical examination of these waters, is it or is it not your judgment that this pollution and the contamination from the Chicago River continues down through the Chain of Rocks?

A. Yes sir.

Q. Then would a portion of it finding its way into the Intake tower of the waterworks, and thence into the reservoir?

A. Yes sir.

Q. Then I will get you to state whether or not in your opinion as a chemist and from your analyses of these waters, the water supply of this city is contaminated by the Chicago Drainage Canal and the sewage emptied into it by the City of Chicago?

A. Yes sir.

Q. Is the volume of water going down the Illinois River greater or less since the opening of the canal?

A. It is greater.

Q. What has been the effect of this in disposing of the sewage. Has it caused it to disappear or does it cause it to be pushed further down the river?

A. It causes it to be pushed further down the Illinois River and into the Mississippi River in greater quantities than before the opening of the canal.

Q. Now, what effect on sedimentation does the increase in the volume of water by the outpouring of the Chicago Canal water, into the Illinois River, have upon the question of sedimentation in the Illinois River?

A. Well, it acts to prevent sedimentation.

Q. Well, would sedimentation be greater or less now than before the waters of the canal were turned into the Illinois River?

A. Less now than before.

Q. Why?

A. Because there is a more rapid current which carries the suspended matters further down in the stream and gives less opportunity for sedimentation.

Q. Now, as the result of your chemical analyses of these waters, I will ask you to state, if you know, whether or not

1705 there is a mixture of the waters of the Mississippi and Missouri Rivers as they come into the Intake Tower, 1500 feet from the Missouri shore in the Mississippi River?

A. My analyses show that the water that we get is a mixture of the Mississippi river water and the Missouri river water.

Q. Does its proportion vary?

A. It varies from day to day,—in fact from hour to hour.

Q. Now, from your examination can you state whether or not at all times there is some of the Mississippi River water in the reservoir of the St. Louis Water Works?

A. My analyses indicate that our water is always a mixture of these two waters.

Q. Well, the water in the reservoir?

A. Yes sir.

Q. Now, of these two waters, the Missouri and the Mississippi does your chemical analyses disclose which is the more potable and the better for domestic and primary uses, the Missouri River water or the Mississippi River water?

A. The Missouri River water is far superior to the Mississippi River opposite the Intake.

Q. Does the Missouri River water contain any particular 1706 chemical constituents in a greater quantity than the Mississippi does?

A. Yes sir.

Q. What is that chemical constituent?

A. It contains a larger proportion of common salt.

Q. Is it that that affects the flavor of the Missouri River water?

A. I think it does.

Q. Why is it that the Missouri River water is found to contain more of that salt than the Mississippi?

A. It has been found that one of the tributaries of the Missouri River that runs in from Kansas, flows over salt beds, and this gives it a large proportion of common salt, and that water mixing with the Missouri gives it a high proportion of salt.

Q. Now do you know whether or not the amount of the impurities increased or diminished in the reservoir after the opening of the Drainage Canal?

A. There was a decided increase in the impurities of the water in the reservoir after the opening of the Drainage Canal.

Q. Was there any coincident increase in the impurities of the water of the Mississippi?

A. There was a decided increase at that time, as shown by all these curves, or nitrites and free-ammonia that have been exhibited.

Q. Now, you have stated and shown by your figures that during the month of May there was a marked improvement in the reservoir water, did this improvement coexist with an improvement in the Mississippi River water?

A. Yes sir.

Q. In 1900?

A. In 1900.

Q. Now to what do you attribute the great improvement of the waters of running streams in spring and summer?

A. First to the greater oxidation which takes place in warm weather; secondly in these waters, to the much greater 1707 volume of the streams.

Q. What is the effect of that dilution?

A. Dilution?

Q. Dilution, or increase in volume?

A. The Missouri and also the Mississippi River are very much higher in the spring months than they are in the fall and winter.

Q. Now, can you state whether or not your chemical examination—whether or not the Mississippi River throughout the time of this examination at the Chain of Rocks,—at the Illinois shore opposite the Chain of Rocks, was in a potable condition and fitted for use for drinking purposes?

A. Throughout the time of this examination analytical results show that the water on the Illinois shore at the Chain of Rocks was in an unsanitary condition. It was water that would be condemned by water specialists. The figures for nitrites and free ammonia are beyond those that are allowable in a potable water.

Q. Now, please state again the amount of nitrites and free ammonia that is allowed in potable water?

A. In a surface water, the averages generally accepted are,

—that is, for free ammonia, the maximum amount is .05, when it goes above .05 parts per million the water is to be regarded with suspicion, and if the albuminoid ammonia goes above .2 parts per million, then there is so much organic matter in the water that the conditions are favorable for the growth and development of disease germs. Then, if there are measureable quantities of nitrites, if you can measure the nitrites, that is, express the result in numbers, we are usually inclined to condemn such water. If we can at all measure the amounts of nitrites we condemn the water, as good drinking water has no nitrites in it, and whenever the chlorine goes above the normal amount, that is indicative sewage pollution.

1708 Q. Now, are you acquainted with the articles by Thomas M. Brown, in the State Board of Health Report, State of Massachusetts, 1890, purporting to be an examination of the water supplies of that city?

A. Yes sir, I have read it.

Q. Mr. Brown and this book, which is the Water Supply of the State of Massachusetts, issued by the State Board of Health there, is it considered standard authority on the question of sanitary water supplies?

A. It is.

Q. Now, he says that "When we speak of a water having high nitrites, we have in mind the general low contents of nitrites in surface waters. The actual amount which would be called high in this case, might be low if applied to ammonia or to nitrates. Thus: .0010 parts in 100,000 of nitrogen, as ammonia, we would call low; as nitrites it would be high, and as nitrates very low; but the free ammonia and high nitrites give us characteristics of recent pollution, and when they are uniformly high in a surface water, they point to continuous pollution. In connection with chlorine above the normal they afford complete proof of sewage contamination." What do you say of these standards that he announces there?

A. Well, they are very similar to what I have stated.

Q. Well, are they standards that you recognized in this work that you have done?

A. Yes sir.

Q. Now, did you find that the high free ammonia and high nitrites gathered in the waters of the Mississippi River up at Grafton and up the Illinois River?

A. Yes sir, they were very high free ammonias and high nitrites in the Mississippi River.

Q. Well, were they to be found together in the water?

A. They were found together, and especially as Grafton we noticed a marked difference at Grafton in the quantities of
free ammonia, and nitrites in the Illinois River, and the
1709 same substance in the Mississippi River. In other words
the free ammonia was low in the Mississippi River at Grafton, and high in the Illinois River. The nitrites were very low in the Mississippi above Grafton and measurable quantities and high quantities in the Illinois River above Grafton.

Q. Well, what about the chlorine found above the confluence of the Mississippi and the Illinois, in the Mississippi, and above the confluence of the two streams in the Illinois?

A. I have the monthly averages for chlorine at those points. I will read you a few of them. I have here the monthly averages for chlorine at a point above Grafton on the Illinois River, and at a point above Grafton in the Mississippi River. Now for January, first Mississippi River above Grafton, and secondly the Illinois River above Grafton: January, Mississippi River above Grafton 5.7; at the same time, Illinois River 14.1; February: Mississippi river above Grafton 6.1; Illinois River above Grafton 13.1; March: Mississippi River above Grafton, 4.5; Illinois River above Grafton, 7.00; April: monthly average for chlorine, Mississippi River above Grafton, 4.8; Illinois River above Grafton, 6.1; May: Monthly average for chlorine, Mississippi River above Grafton, 4.2; Illinois River above Grafton, 10.9; June monthly average for Mississippi River above Grafton, 5.1; Illinois River above Grafton, 12.6; July: Monthly average for chlorine, Mississippi River above Grafton, 7.7; Illinois River, above Grafton, 18; August: Monthly average for chlorine Mississippi River above Grafton, 5.2; Illinois River above Grafton, 16.5; September: Chlorine, monthly average, Mississippi River above Grafton, 3.3; Illinois River above Grafton 14.8; October: average for Mississippi River above Grafton, 3.9; Illinois River above Grafton, 16.9.

1710 Mr. Johns: That is 1901.

The Witness: 1900, this was.

By Attorney General Crow:

Q. Please state the maximum that you found each month in the Mississippi and in the Illinois above Grafton?

A. The maximum for chlorine in the Mississippi above Grafton occurred in July, 1900, and amounted to 7.7.

The maximum chlorine in the Illinois above Grafton occurred in the same month, July, 1900, and amounted to 18 parts per million.

EDWARD H. KEISER.

Adjourned until 10:00 A. M., Saturday, March 14, 1903, at same place.

1711 Southern Hotel, St. Louis, Missouri. 10:00 a. m., March 14, 1903.

Present, the commissioner and same counsel representing the respective parties.

DR. EDWARD H. KEISER

Resumed the stand for further direct examination by Attorney-General Crow and testified as follows:

Q. Now, professor, I will get you to state, if you made any chemical analyses of the water at Lockport and Joliet?

A. I did.

Q. Well, do you know where the Illinois and Michigan Canal enters the Desplaines river?

A. The Illinois and Michigan Canal crosses the Desplaines river at Joliet and then comes down to La Salle where it enters the Illinois river.

Q. Now, have you got a table at Joliet?

A. Yes sir.

Q. Showing the nitrites?

A. Yes sir, I have.

Q. For what year?

A. I have the averages of nitrites, the weekly averages and monthly averages, beginning with March 1, 1900, down 1712 to October 10th inclusive. Then I also have the averages of nitrites from Oct. 1, 1901, to Nov. 30, 1901.

Q. Is that the weekly or daily averages?

A. I have the weekly averages made from the daily analyses.

Q. Now, will you please give me the maximum for the various months beginning in March, 1900, of the nitrites found in the Illinois river at Joilet beginning in March, 1900, and extending until October 11, 1900?

A. The maximum amount of nitrites in the water at Joliet in March occurred in the last week of March, 1900, and amounted to .067.

Q. What is that?

A. Nitrites, the parts per million. The average for that month was .0558.

The maximum amount for April occurred in the first week of April and it amounted to .1014.

The average for April was .0663.

Then for May the maximum amount occurred in the second week and amounted to .0340.

The average for May was .0256.

The maximum for June occurred in the last week in June and amounted to .0345, and the average was .0326.

1713 The maximum amount for July occurred in the third week of July and the amount was .0728 and the average for July was .0551.

The maximum amount for August was in the second week of August and the amount was .0597 and the average for August was .0465.

The maximum amount for September was in the second week of September and the amount was .0754 and the average for September was .0524.

The average amount for October from the first to tenth. .0562. That is the October average.

Now, for 1901, October, the maximum occurred in the third week of October and amounted to .0830 and the average for October, 1901, was .0780.

The maximum for November occurred in the first week of November, 1901, and was .0781, and the average for November was .0510.

Q. Now, have you a record of the free ammonias at the places which you have just given?

A. I have.

Q. State the tables that you have prepared and the dates and the maximum for each month and the average.

1714 A. The maximum amount in March, 1900. This is the free ammonia now for Joliet. The maximum amount in March, 1900, occurred in the first week in March and the amount was 3.491. The average for March was 2.689.

For April the maximum amount occurred in the first week of April and the amount was 3.140. The average for the month was 2.732.

For May the maximum amount occurred in the first week and was 3.604. The average for May was 2.995.

For June the maximum occurred in the second week of June and the value was 3.600. The average for June was 3.270.

For July the maximum occurred in the first week and the amount was 4.647. The average for the month was 3.701.

In August the maximum occurred in the last week and the value was 3.999. The average for August being 2.933.

For September the Maximum amount occurred in the third week and the value was 5.473. The average for the month of September was 4.498.

For October from the 1st to the 10th the value was 3.306.

Q. Is that for 10 days?

A. Yes, sir, just 10 days, we stopped at the 10th?

1715 Q. That is all you took in October?

A. Yes, sir, that is all I took in October, 1900, but in 1901 now—

MR. JOHNS: Was that the maximum or the average?

A. The average.

MR. WOERNER: It was both.

A. We did not select individual dates. The other was the highest for the week.

JUDGE SPRINGER: That was the average for 10 days.

A. The average for the first 10 days of October, 1900.

GENERAL CROW: Now go on with 1901.

A. In October, 1901, the maximum occurred in the second week and was equal to the value of 5.519, and the average for that month was 3.801.

For November the maximum occurred in the third week in

November and the value was 3.494, and the average for the month was 3.152.

Q. Is that all?

A. That is all.

Q. Now, give the data in the same way from Lockport.

JUDGE SPRINGER: Is this free ammonia?

A. I am starting now with free ammonia for Lockport. Had we better have the nitrites first?

1716 MR. WOERNER: Follow the same order.

A. Well, the order would be nitrites first, for 1900. The maximum amount in March, 1900, occurred in the fourth week and amounted to .0945 and the average for the month was .0643.

The maximum of April occurred in the first week in April and amounted to .1011, and the average for April was .0730.

The maximum for May occurred in the second week and it amounted to .0405, and the average for May was .0234.

The maximum for June occurred in the first week in June and amounted to .0295, and the average for June was .0114.

The maximum in July occurred in the third week in July and amounted to .0114, the average, however, for that month was .0081.

The maximum for August occurred in the third week in August and equalled .0140, and the average for the month was .0083.

The maximum for September occurred in the fourth week in September, 1900, and was equal to .0108 and the average in September was .0071.

Now for October the average was .0138.

1717 Now, for 1901: In October the maximum occurred in the third week and was .0172, and the average for the month was .0167.

For November, 1901, the maximum occurred in the first week from the 1st to the 7th, and amounted to .0210, and the average for that month was .0189.

Now, the free ammonia is at Lockport. We give the nitrates first and the free ammonia. Now, we have given the nitrites so we only have left the free ammonia.

Free ammonia, Lockport, 1900, for March: The maximum amount occurred in the second week and was 3.095, and the average was 2.437.

For April the maximum occurred in the first week and was 2.591, and the average was 1.806.

For May the maximum occurred in the first week and amounted to 2.236, and the average was 1.598.

For June the maximum occurred in the fourth week and amounted to 1.677 and the average for the month was 1.411.

For July the maximum occurred in the first week and amounted to 1.834, and the average for the month was 1.631.

In August the maximum occurred in the fourth week and amounted to 1.974, and the average for the month was 1718 1.589.

For September the maximum occurred in the third week and amounted to 2.685, and the average for the month was 2.195.

For October the average for the first 10 days was 1.555.

For 1901, October, the maximum occurred in the second week and amounted to 1.663, and the average for the month was 1.466.

For November the maximum occurred in the first week and amounted to 1.368, and the average for the month was 1.239.

Those are all the statistics for Lockport.

GENERAL CROW: Now, you have just given the maximum and average?

A. The monthly averages, yes sir, at Lockport and Joliet.

GENERAL CROW: These tables will be Nos. 15, 16, 17 and 18, and they will carry their own history with them. They are for the nitrites and free ammonia at Lockport and Joliet.

A. The tables are above referred to.

1719 GENERAL CROW: Now, have you made a chemical examination of the Illinois river above Peoria for the determination of nitrites?

A. Yes sir.

Q. For the period from January 24, 1900, to October 11, 1900?

A. I have.

JUDGE SPRINGER: Is this the nitrites?

GENERAL CROW: This is the nitrites in the Illinois river above Peoria.

Q. Will you please give me the maximum amount for the different months together with the average during that period?

A. The Illinois river above Peoria, nitrites parts per million. The maximum amount from January 24 to the 31st, 1900, was equal to .0248.

MR. JOHNS: That is the maximum?

A. Yes, that is the maximum for those 7 days. The maximum for February occurred in the first week and amounted to .0414, and the average for February was .0358.

The maximum for March occurred in the second week and amounted to .0268, and the average for March was .0209.

The maximum for April occurred in the fourth week and amounted to .0771, and the average for April was .0467.

1720 The maximum for May occurred in the second week and amounted to .1023, and the average for May was .0752.

For June the maximum occurred in the third week and amounted to .1448 and the average was .1317.

For July the maximum occurred in the third week and amounted to .2171, and the average was .1657.

For August the maximum occurred in the third week and amounted to .1743, and the average for the month was .1597.

For September the maximum occurred in the first week and amounted to .2171, and the average for the month was .1382.

For October the average for the first 10 days was .1857.

Shall I give the free ammonias now?

GENERAL CROW: Yes, give the free ammonias now.

JUDGE SPRINGER: For the same period.

A. The free ammonias for the same dates beginning with January. The average from January 24 to 31, was 2.485.

For February the maximum amount occurred in the first week and was 2.169 and the average for that period was 1.416.

For March the maximum amount occurred in the second
1721 week and was 1.021. The average for March being .685.

For April the maximum occurred in the third week and amounted to .455 and the average for that period was .392.

For May the maximum occurred in the third week and amounted to .361 and the average was .266.

For June the maximum amount occurred in the fourth week and was .319, and the average was .228.

For July the maximum occurred in the third week and amounted to .401, and the average was .230.

For August the maximum occurred in the fourth week and amounted to .172 and the average was .142.

For September the maximum occurred in the fourth week and amounted to .672 and the average was .255.

From October 1st to 10th the average was 1.404.

GENERAL CROW: Now, these tables will be 19 and 20, showing the nitrites and free ammonia in the Illinois River above Peoria.

GENERAL CROW: Have you got an analysis of the
1722 water, of the sample made in the canal above Lockport?

A. Yes, sir.

Q. Where is that?

A. I have that here. I have an analysis here of the water taken from the Drainage Canal off Pauline Street. The analysis extending from Oct. 9th to Nov. 30th, 1901.

Q. Now, does that table disclose the nitrites and the free ammonia?

A. It does.

Q. And does it show the chlorine?

A. Yes, sir.

Q. Will you please give me those results?

A. First for the nitrites?

Q. Yes.

A. The nitrites run as follows:

October	9th,	Nitrites,	.016
"	10th,	"	.040
"	11th,	"	.018
"	12th,	"	.017
"	13th,	"	.036
"	14th,	"	.015
"	15th,	"	.017
"	16th,	"	.018
1723 "	17th,	"	.018

Now skip to the 21st. There were three days when we received no samples.

October	21,	Nitrites,	.019
“	22nd,	“	.027
“	23rd,	“	.013
“	24th,	“	.016
“	26th,	“	.015
“	27th,	“	.014
“	28th,	“	.025
“	29th,	“	.016
“	30th,	“	.019
“	31st,	“	.018

November 1st 1901, Nitrites parts per million.

November	1st,	Nitrites	.028
“	2nd,	“	.016
“	3rd,	“	.017
“	4th,	“	.103
“	5th,	“	.017
“	6th,	“	.015
“	7th,	“	.018
“	8th,	“	.028
1724 “	9th,	“	.015
“	10th,	“	.015
“	11th,	“	.013
“	12th,	“	.025
“	13th,	“	.015
“	14th,	“	.015
“	15th,	“	.027
“	16th,	“	.016
“	17th,	“	.023
“	18th,	“	.015
“	19th,	“	.016

“	22nd,	“	.013
“	23rd,	“	.018
“	24th,	“	.017
“	26th,	“	.017
“	27th,	“	.017
“	28th,	“	.016
“	29th,	“	.017
“	30th,	“	.015

GENERAL CROW: Now give us the chlorines next.

A. For the chlorines I will begin with October.

1725 JUDGE SPRINGER: What are you giving, the free ammonia or the chlorine?

A. The chlorines. The parts per million of chlorine for the same period, 1901, October 1st, Drainage Canal off Pauline St.

	October	9th,	Chlorine	22.8
	"	10th,	"	23.0
	"	11th,	"	18.0
	"	12th,	"	12.1
	"	13th,	"	20.8
	"	14th,	"	21.0
	"	15th,	"	19.0
	"	16th,	"	23.2
	"	17th,	"	19.5
	"	21st,	"	22.3
	"	22nd,	"	22.5
	"	23rd,	"	17.5
	"	24th,	"	18.2
	"	26th,	"	22.0
	"	27th,	"	21.3
	"	28th,	"	21.7
	"	29th	"	23.8
	"	30th,	"	29.0
	"	31st,	"	24.2
1726	November	1st,	Chlorine	21.5
	"	2nd,	"	23.0
	"	3rd,	"	13.8
	"	4th,	"	13.2
	"	5th,	"	11.3
	"	6th,	"	10.0
	"	7th,	"	16.0
	"	8th,	"	12.0
	"	9th,	"	10.8
	"	10th,	"	14.2
	"	11th,	"	14.8
	"	12th,	"	106.0
	"	13th,	"	12.2

	November	14th,	Chlorine	9.0
	"	15th,	"	8.0
	"	16th,	"	11.0
	"	17th,	"	11.0
	"	18th,	"	9.0
	"	19th,	"	11.2
	"	21st,	"	8.
	"	22nd,	"	11.9
	"	23rd,	"	11.3
	"	24th,	"	12.3
1727	"	26th,	"	9.0
	"	27th,	"	11.6
	"	28th,	"	16.1
	"	29th,	"	16.2
	"	30th,	"	29.0

Now, the free ammonias from October 9th, the parts per million,—

	October	9th,	Free Ammonia	.328
	"	10th,	"	2.860
	"	11th,	"	.676
	"	12th,	"	.812
	"	13th,	"	1.66
	"	15th,	"	1.072
	"	16th,	"	1.500
	"	17th,	"	.884
	"	21st,	"	.672
	"	22nd,	"	.334
	"	23rd,	"	.884
	"	24th,	"	.796
	"	26th,	"	.732
	"	27th,	"	1.020
	"	28th,	"	1.288
	"	29th,	"	.744
	"	30th,	"	.700
1728	"	31st,	"	.744

November 1901,	1st,	Free Ammonia	.968
"	2nd,	"	.628
"	3rd,	"	.648

	November 1901,	4th,	Free Ammonia	.988
	"	5th,	"	1.068
	"	6th,	"	.568
	"	7th,	"	.652
	"	8th,	"	.436
	"	9th,	"	.452

	"	28th,	"	.256
	"	29th,	"	1.892
	"	30th,	"	2,140

Q. Now, Profesor Keiser, will you please state what conclusions as a chemist, you came to from your examinations and investigations from those tables which you have just read?

A. From these analytical results we see that the water of the Illinois River was more highly contaminated with nitrogenous organic matter at Joliet than it was at Peoria and likewise at Lockport there was a greater contamination than at Peoria.

Now, our results show higher values for free ammonia nitrites at Joliet than they do at Lockport. This I account for by the fact that the samples at Joliet were taken immediately under the Illinois and Michigan Canal that passes over the river at that point. The results for Joliet show, or rather the analyses

1730 show, that it is sewage. It cannot be called water. The samples we have were really to be called sewage instead of water and at Lockport while the proportions were less than at Joliet, nevertheless we must still call it a somewhat diluted sewage.

Now, I notice further than several months after our analyses began along in the spring months, the quantities of nitrites and free ammonia diminished both at Lockport and at Joliet. This is accounted for by the outflow of the water of the Drainage Canal. At Lockport the free ammonias diminish from 2.437 down to 1.411 in June. We find that they again increased and in the subsequent year, 1901, they did not diminish below 1.239, showing a partial improvement. In other words, after the opening of the Drainage Canal, this concentrated sewage at Lockport and Joliet was diluted. That in portion is the result of the analyses. That before the canal was opened there was concentrated sewage there and that after the canal was opened there was diluted sewage there and the results obtained at Peoria and points further down the river show that this sewage from Lockport and Joliet had been washed further down the river.

1731 My analyses show that this river was contaminated before the investigation began. The river was polluted with sewage long before the opening of the Drainage Canal but after the opening of the canal the sewage was diluted with water and carried farther down. We found at Grafton much higher nitrites and free ammonias after the opening of the canal than before and that, in my mind, is evidence of the flushing down of the sewage matter which had accumulated at Lockport and Joliet and in the upper regions of the river.

Q. By the opening of the canal?

A. Yes, by the opening of the canal. And where as formerly the sewage had collected in the upper part of the river, by the opening of the canal and the flowing down of the larger volume of water, the sewage was diluted and carried farther down the stream and that is shown very plainly by our curves of nitrites for Grafton and Alton and Hartford.

Q. Now, Professor, I show you here a chart marked Plat 11. Did you make this?

A. Yes, sir.

Q. Please state why and what it shows.

A. This map contains curves of the quantities of nitrites in the Mississippi River above Grafton, at the Illinois
1732 shore, Chain of Rocks, at Hartford and at Alton and also in the Ilinois River above Grafton. Those are the quantities of nitrites that have been read off in the table that have been platted on this chart.

Q. That is, it shows graphically what you have stated in your table?

A. Yes, sir. The chart is constructed by measuring off those months from January to October on a horizontal line and measuring the nitrites in the vertical column. The first dotted red curve shows the fluctuation in the amount of nitrites in the Mississippi River above Grafton. We see that this is the lowest curve, showing that in the river above the mouth of the Illinois there were less nitrites than at any other point here considered.

The second curve shows the fluctuation in the amount of nitrites at the Illinois shore, Chain of Rocks, from the period of January to October.

We see that in June it follows the same contour of the curve of the Mississippi River above Grafton but it is higher; that is, there were more nitrites at the Illinois shore, Chain of Rocks than there were in the Mississippi River above Grafton.
1733 The third curve shows the fluctuation of nitrites at Hartford. This again is somewhat higher than the curve of nitrites at the Illinois shore.

And the fourth, is Alton, which is very similar to the Hartford curve.

Then the last curve on here shows the fluctuation of nitrites in the Illinois river above Grafton. This is the dotted red line and this again is much higher than any of the others.

The map is offered in evidence and marked by the Commissioner "Complainant's Exhibit 34. Frank S. Bright, Commissioner."

Q. Now, you have the original notes made by you of the chemical analyses of the Canal, have you, and down the river?

A. Yes, sir.

Q. Now just state if your examinations show any odors or discoloration of the waters at the various points?

A. Yes, sir, from the record made from time to time of these daily samples—I made a record from time to time of these daily samples of the physical appearance.

Q. Well, would that examination disclose the presence or absence of sewage matter?

A. It would only show the presence of sewage provided
1734 there was a great deal of it in the water.

Q. Well, did it disclose that at any time and any point during these examinations in the Illinois River and Mississippi River?

A. It did. My original notes of analyses show that throughout the month of March, for example—

Q. March of what year?

A. 1900. My notes show the water had a decided odor of sewage as here recorded. March 12th to 28th the record is that the odor—

Q. At what place?

A. At Lockport. That the odor was that of sewer gas. Written here "Odor, sewer gas." That is, the odor of the water as it came to the laboratory for analyses.

On the third it had an odor resembling that of turpentine.

On the fifth it is described as an odor of coal gas.

On the 7th the odor is described as that of turpentine and on the 14th the odor is described as that of sewer gas and on the 15th the odor is described as that of sewage and so on through the month.

Q. Give it wherever the odors appear. Is there anything in the chemical analyses that would indicate whether the
1735 chemical constituents were warm or cold?

A. Yes, some of the odors were taken, most of the time both cold and hot. When the water was cold and when it was heated up. The odor was always more pronounced when heated.

Q. Well, is the odor distinguishable as to whether it was warm or cold?

A. I don't understand your question.

Q. Well, what I mean is could you tell from the odor whether the sewage was warm or cold?

A. I don't catch the question yet.

Q. What I want to get at is, is the heat disclosed by your chemical analyses?

A. Well, the water was cold when it came to me.

Q. You don't understand me yet. The chemical constituents of the analyses, from that can you tell whether it was hot or cold?

A. No, sir.

Q. You cannot except as you take the temperature of the water?

A. Yes, sir that is all.

Q. Now after you get the temperature is there any difference in the odor whether it is cold or warm?

1736 A. Yes, the odor is always more pronounced when it is warm than when cold.

Q. Now, just go through your analyses there and indicate the points and times when these odors were prevalent?

A. At Joliet during the month of March 1900, the water on the third day of the month had a very decided odor in the cold, of turpentine and of sewage when it was warm. On the sixth, 7th, 8th, 9th, 10th, 11th and 12th this condition continued. On the 17th the sample had a decided odor of sewage both hot and cold, likewise on the 21st. On the 29th of the same month the water although colored in appearance, had a distinct odor of turpentine in the cold and when heated up had a pronounced sewage odor.

Then passing down the river to Peoria, we find at Peoria in the early part of February 1900, that the samples had a characteristic odor of weeds or rather a musty smell, and on the 10th, the record is that there is a pronounced sewage odor of decaying animal matters when warm. On the 13th and 14th the odor is described here as that of decaying animal matter.

Q. Is that above or below Peoria?

1737 A. Above Peoria. In the month of March the records show that the water that came to the laboratory had an odor of decaying animal matters and the chart record is odor of turpentine.

Q. Where was that found, that water?

A. Still at Peoria.

Q. Above or below Peoria?

A. The Illinois River above Peoria. On the 10th of the same month the water had a decided musty odor and on the 23rd it is described as sewage. Now, the Illinois River 3 miles above Grafton during the month of February 1900. We will take February 10th for example. The notes show that the water had a decided musty smell and on the 15th the odor resembling that of kerosene or decaying matter and on the 18th it is described as a disagreeable odor.

Q. At what point?

A. At the same point, the Illinois River three miles above Grafton and the odor is described as musty, and on the 23rd a sewage odor.

Now, I have some here for the Mississippi River above Grafton. Do you want those?

Q. Yes, give those, give the year and the place?

A. February 25, 1900. The notes here show no odor, throughout the month, likewise it has no odor except on the 10th
1738 the record is, an earthy smell, the water had an earthy odor and that continued until the 15th and then on the 16th of February the notes show no odor and none the rest of the month.

The Mississippi River at the same point in 1900 in March. The water is described for the greater part of the month as having an earthy odor or clay odor, then again follows a long period with no odor noticeable in the river. There is difference between the waters at Grafton taken from the Illinois and Mississippi.

Q. Above or below the mouth of the Illinois and Mississippi?

A. Above the mouth. Whereas the water in the Illinois has a musty smell or a smell of sewage, that from the Mississippi has that odor of the earth, earthy or clay like smell.

Q. What is the cause of the two different smells in the water?

A. The clay or earth like odor of the Mississippi is due to earthy matters in the water, the earth being stirred up in the water is often cloudy. The other odor, the musty smell and sewage smell, can only be attributed to sewage impurity. I have some records for Alton.

Q. Give them.

1739 A. In February 1900 the Mississippi River at Alton. The physical properties of the river are described here as follows: February 1st found oily odor and a very slight odor on the 6th.

Q. Was that taken above or below the City of Alton?

A. Above the City of Alton. The odor continues. Found oil like odor through the remaining few weeks of February 1900. March 4th the river contained that odor of the water at Alton, was similar to that, of turpentine. That continued for several days. On the 8th, however, it had the earthy odor and on the 9th it had the odor of weeds and clay and on the 18th there was a pronounced odor of sewer gas in the Alton sample. During the rest of the month there was no characteristic odor noticed.

Q. Now, you have the record for Hartford, have you?

A. I also have the Hartford record. That is very similar again to the Alton record.

Q. That is for March 1900?

A. Yes, sir. On the 6th day of March the record is put down as musty or like weeds. On the 9th it is like clay, when heated up however, it had a characteristic turpentine
1740 smell.

Q. What is the cause of that turpentine smell?

A. I attribute that to the sewage. It is similar to the gas formed by the bacteria in the water; similar to marshy gases. Then, this musty smell was noticed on the 18th, 19th, 20th and 21st.

Q. What does the musty odor indicate?

A. That is due to bacterial action.

Q. Well, does it indicate animal organic matter in the water?

A. Yes, sir to my mind it does and when the water was warm these smells in March from the 19th until the end of the month—the warm water had a distinct odor of sewage. The record here is that the hot water had an odor of sewage from the 19th until the 31st.

Q. Will you state if that sewage odor from water in chemical analyses is an indication of sewage pollution?

A. Yes, it is. It is an indication of decomposing sewage matters in the water. I have here the Bellefontaine samples, or Missouri samples, do you want those?

Q. Yes.

A. During the same period of time observations were 1741 made on the odors of the water from the Missouri river at Bellefontaine. During February the odor is described here as earthy, both cold and hot. The Missouri water had a decided earthy odor from February 1st to 10th and from the 10th until the 19th there is also a record that the water had an earthy odor both hot and cold. From the 20th on to the rest of the month there was no odor noticed in the water of the Missouri.

I have here the Illinois Shore, Chain of Rocks. February 1st the laboratory notes show that the water collected at the Illinois shore Chain of Rocks during the month of February had a musty odor both hot and cold. February 1st there was an odor of weeds—decaying weeds. On February 9th it had more of an earthy smell, both hot and cold and on February 21st there was no odor noticed.

Q. Now, Professor, I want to ask you this question, as to whether or not decaying organic vegetable matter in water that is running will produce musty smells or turpentine odors or the odors of sewer gas or sewage odors?

A. As far as my experience goes, decaying vegetable matter produces carbon dioxide and marsh gases. These are two 1742 colorless and odorless gases. On the other hand, the decayed sewage produces gases such as phosphoretted hydrogen to a certain extent from phosphorus compounds, that is a characteristic smell, together with more complicated carbonaceous gaseous compounds that have disagreeable odors. For example we have an illustration in decaying albumen of the white of an egg. That is an albuminous substance and the odors produced from the albumen decayed is very marked and different from the odor when wood decays. Now, wood is a characteristic vegetable matter and albumen is of animal matters.

Q. Now, when you say decaying organic matter, either animal or vegetable, do you have reference to the action of the bacteria on the organic matter?

A. Yes, sir.

Q. That, is you use the term decaying as applied to the bacterial action upon substances in the water?

A. We look upon decay as a process brought out through the action of bacteria. They act as carriers of oxygen from the air to the organic matter.

1743 Q. Now, from your chemical analyses Professor, can you state if the nitrites or chlorine are higher at that point above Peoria than they were at Grafton in the Illinois river?

A. The cholrines above Grafton in the Illinois River steadily increased. I have here a table giving the average values of chlorine in the Illinois River above Grafton, above Peoria and at Joliet and at Lockport. We see a steady increase of chlorine as we ascend the river to Joliet. The Lockport samples show less chlorine than at Joliet.

Q. How do you explain that?

A. The explanation that I give for that is that the sample at Joliet was taken immediately under the canal, under the Illinois & Michigan Canal and probably contained water from that canal.

Q. That is the intersection of the two canals, that is this Illinois and Michigan canal crosses there?

A. It crosses the Desplaines River at that point.

Q. Now, can you state from your chemical examination and analysis of the waters, whether or not the nitrites are higher at a point above Peoria than they are at Grafton?

A. Yes, sir, they are decidedly higher at Joliet.

1744 Q. Now, how do the nitrites at Joliet and Peoria compare with the nitrites in the canal above Lockport? Just your general conclusions, I don't care about figures. Have you compared it?

A. I will just look up those statistics again. (Witness refers to memoranda.)

A. They are lower in the Drainage Canal showing that there has been less oxidation and I think they are a little lower at Lockport than they are at Joliet.

Q. Would that indicate more or less crude sewage in the Canal than at Lockport or Joliet?

A. That shows that there is more crude sewage in the canal than there is at points further down. The nitrites being formed gradually, free ammonia is first formed by the decomposing sewage then the oxidation processes set in and gradually form nitrites, so we find more nitrites at Peoria than we do at some of those higher points.

Q. At Joliet or Lockport?

A. At Joliet or Lockport. There hasn't been oxidation sufficient to produce large quantities but there are larger quantities of free ammonia at the higher points than at the lower points.

1745 Q. In other words, there is more organic matter in the same state that it came from the sewers in the canal than there is at Joliet or Peoria?

A. Yes, sir.

Q. Now, Professor, I will show you a map and ask you whether or not you had that made and if so show what it is?

A. Yes, I had this map constructed from the analytical results obtained in the analyses of the waters at the various points on the way from St. Louis to Chicago.

Q. Now, what is it a map of?

A. The map shows the Illinois River connecting the Drainage Canal with the Mississippi River at Grafton, then it shows the Mississippi River below Grafton, at Alton and at Hartford; it shows the flowing in of the Missouri River at Hartford; then it traces the Mississippi River down to St. Louis. The map is an enlargement of the map of the State of Illinois, taking only the Illinois River and the Mississippi River and these rivers.

Q. Well, proportionately, is it accurately drawn?

A. Well, approximately accurately. It was made by means of a pantagraph, an instrument that enlarges from a smaller map. The lines from the smaller map were enlarged and
1746 drawn on here, giving the contour of the Illinois River, so that it gives approximately the curves and the relative distances of the points on this river.

Then on the side of this map, are given the averages of the condition of the water, first before the opening of the canal, viz: in January, 1900, at the reservoir. First the table shows the condition of the water at the reservoir in St. Louis in black letters, the amounts of free ammonia, nitrites and albuminoid in January, 1900, and then below the values obtained for the same substances free ammonia, nitrites and albuminoid ammonias in February, 1900, after the opening of the Drainage Canal. These are averages taken from the tables that we have presented. For instance, the free ammonia before the opening of the canal averaged 0.111; after the opening, 0.210. The nitrites averaged before the opening 0.004 and after the opening 0.013. Albuminoid ammonia before the opening was 0.214 and after the opening 0.271. It shows a doubling of the free ammonias and trebling of the nitrites and some increase in the albuminoid ammonias in the waters of the reservoir in February over what there was in January.

Q. That was at what point?

1747 A. The reservoir of the St. Louis Water Works.

Q. Out or in the reservoir?

A. In the reservoir. It is the water that is furnished to our pumps.

Now, the next table shows similar results for Alton on the Mississippi River. The averages are given for January, 1900, and then for February, 1900, after the opening of the canal. For free ammonia and nitrites and albuminoid ammonia before the opening of the canal. Free ammonia was 0.288, after the opening it was 0.460.

The nitrites before the opening of the canal amounted to 0.212, after the opening 0.104.

The albuminoid before the opening of the canal amounted to 0.200 and after the opening 0.728.

Q. Now, in those two figures of tables you have stated, have the waters from the drainage canal reached Alton and reached the reservoir at any time during the period of these tables?

A. The water of the drainage canal?

Q. Yes.

A. I presume they have.

Q. At what time?

A. In the middle of February, from February 17, 1900.

1748 There was one month's difference between the opening of the canal and the time when this figure is given. 30 days at Alton. 30 days had elapsed.

Q. How about the first table you gave for the reservoir?

A. That is for the whole month.

Q. The month of what?

A. The month of February, 1900. That is the average for the whole month of February.

Q. Now, what is the next point at which you have the table?

A. There is a similar table for the Illinois River above Grafton showing the condition of the water there from January 23rd to the 31st, 1900, as compared with the condition of the water from Feb. 21st to the 28th, 1900? Before the opening of the canal free ammonia existed in the water to the extent of .0113 parts per million and after the opening .0946. The nitrites before the opening amounted to 0.005 and after the opening 0.025. The albuminoid ammonia before the opening amounted to 0.478 and after the opening 0.193.

Q. Now, what does that table show with reference to the
1749 increase or decrease of free ammonia, nitrites and albuminoid ammonia at Grafton in the mouth of the Illinois River before or after the opening of the canal?

A. It shows a very marked increase in the impurities, in the free ammonia and nitrites and albuminoid ammonia.

Q. Now, what is the next point at which the table is made?

A. The next point at which a table is made is the Illinois River above Peoria.

Q. Now, where is Peoria located and what distance from the mouth of the canal where it empties into the Desplaines river?

A. Peoria is 196 miles from the St. Louis water works by river and its distance to the mouth of the canal is 131 miles.

Q. Well, have you got a table for that point?

A. I have here a table giving the value of the free ammonia and nitrites and albuminoid ammonia as made in the year 1899; the average values made in the year 1899 by Professor J. H. Long and published in a report. I had to do this for the reason that my analyses were made in February and March, 1900, and after that time the water of the Drainage Canal had already reached Peoria.

1750 Q. Now, do you know whether the samples of water that you analysed, on which you base your calculations, were taken above or below the sewage of Peoria?

A. Mine were taken above Peoria.

Q. You don't know at what point with reference to Peoria in the Illinois River the samples reported by Professor Long were taken?

A. No, I do not.

Q. Give me the result of that Professor?

A. The values before the opening of the canal of free ammonia were 0.895 and after the opening of the canal 3.060 according to Professor Long, and according to my analysis 1.950.

The nitrites before the opening of the canal, were 0.141 according to Professor Long. After the opening 0.060, according to Professor Long. According to my analysis .030.

The albuminoid ammonia before the opening of the canal was 0.572 by Professor Long, after the opening of the canal 2.210 by Professor Long. According to my analysis 0.627.

Q. Now, Professor Long's were made in 1900 from what dates?

1751 A. From February to April, 1900.

Q. And in 1899 what were the dates?

A. From July to September, those are the averages.

Q. And those were made in 1900 at what dates?

A. In February and March, two months average.

Q. What chemically does that show with reference to the ammonias, nitrites, albuminoid ammonia, as to whether they have increased or diminished in the periods covered?

A. It shows there was a very great increase.

Q. Now, that table shows that from your figures alone or the combined figures of yourself and Professor Long?

A. From the combined figures there is a marked increase here of the free ammonia, nitrites and albuminoid ammonia?

Q. Do Professor Long's figures show the same thing?

A. They do.

Q. What would that indicate, an increase of nitrites?

A. That would indicate an increase of pollution of sewage.

Q. Now, have you a table or did you make a table of Grafton?

A. I have another table here showing the condition of the Mississippi River above Grafton before and after the opening of the Drainage Canal. We have here the condition of the Mississippi River above Grafton in the period immediately preceding and that succeeding the opening of the Drainage Canal. Before the opening of the drainage canal the free ammonia was 0.113. After the opening 0.176. The nitrites before the opening were 0.005 and after the opening the same thing. 1752

The albuminoid ammonia before the opening was 0.478 and after the opening 0.565.

Q. Now, does that table indicate more or less pollution for Grafton before the opening of the canal?

A. The Mississippi River shows that during this same period there was very slight if any increase in the impurities. The free ammonia increased slightly; the nitrites remained the same and the albuminoid ammonia increased in a very small amount.

Q. Now, were those samples taken from above or below the mouth of the Illinois River?

A. Above the mouth of the Illinois River.

Q. Now, have you made any comparison of the samples taken at Bellefontaine in the Missouri River?

A. I have also made a table of the condition of the water in the Missouri River at Bellefontaine.

Q. Now, where is Bellefontaine on the Missouri River with reference to distance from the intake of the Water Works at St. Louis?

1753 A. It is 14 miles from the intake of the St. Louis Water Works by river but it is above the mouth of the Missouri River. In order to get the idea of the condition of the water in the Missouri River during this same period immediately before and after the opening of the drainage canal I have taken the average of the analyses of the Missouri River saved from January, 1900, and I find that before the opening of the canal that free ammonia was 0.135 and after the opening the average for February was 0.148. The nitrites before the opening were 0.008 and after the opening 0.014.

The albuminoid ammonia before the opening was 0.063 and after the opening 0.395.

Q. Now, what does that table show with reference to whether or not the stability during that period of time in the waters of the Missouri River at Bellefontaine?

A. It shows that there was also a slight increase in the impurities in the Missouri River during the months of February to April, but this increase was very much less than the increase in the waters of the reservoir, in our reservoir water. Whereas, the increase in the free ammonia in the Missouri was only .013, the increase in the water of the reservoir was 100 per cent or 1/100.

Q. Increase of what?

1754 A. Free ammonia.

Q. How about the nitrites?

A. The nitrites in the Missouri River increased .006 in the reservoir to .009.

Q. How about the albuminoid ammonia?

A. The increase in the albuminoid ammonia in the Missouri was 0.332 and in the reservoir 0.057.

Q. Now, do you know whether or not the frequent or sudden changes of nitrites and free ammonia and chlorine in streams is looked upon as an indication of pollution?

A. Yes. The sudden changing in the nature of water is always to be regarded as suspicious.

Q. Why is that?

A. Because it shows that there is sewage pollution. Sewage pollution brings about changes in the composition of waters much more readily. These fluctuations vary more in samples taken at the same point in a stream charged with sewage pollution than you find in a stream containing vegetable or organic matter. Vegetable organic matter is much more stable than animal matter, that is very much less stable and we are apt to find greater changes and sudden fluctuations in the free ammonias and in the nitrites in sewage polluted water than in water containing vegetable organic matters.

1755 Q. Now, I believe you stated yesterday that you were acquainted with Dr. Drown's work on Water Analysis?

A. Yes, sir.

Q. Well, is that a recognized authority?

A. Yes, sir.

Q. Well, he states this "That it is most important to know if water is stable, since one of the best aphorisms ever contributed to the literature of the water analysis is a state of change is a state of danger." Now, as a chemist and water analyist, do you recognize that as one of the nitrites or dangerous waters?

A. Yes, sir, I do.

Q. Can you tell from you chemical analyses and results thereof whether or not the waters of the Mississippi River above Grafton and the Missouri above the confluence of the Mississippi are stable?

A. They are much more stable than the water of the Illinois River or of the Mississippi River below the mouth of the Illinois.

GENERAL CROW: Now, I want to offer that map referred to by the witness.

1756 Map offered in evidence marked by the Commissioner "Complainant's Exhibit No. 35. Frank S. Bright, Commissioner."

EDWARD H. KEISER.

Adjourned until 10 o'clock A. M., Monday, March 16th, 1903.

1757 Southern Hotel, St. Louis, Mo. 10:00 a. m., Monday, March 16, 1903.

Present, the Commissioner and same counsel representing the respective parties.

PROFESSOR EDWARD KEISER, resumed the stand for further direct examination by General Crow and testified as follows:

Q. Professor Keiser, will you please state what season of the year oxidation of running water occurs most rapidly?

A. In the spring and summer months. During the summer months when the temperature is high, oxidation takes place. I should say in June, July and August are the months of the year when there is the greatest self-purification of streams. I should think there would be and in fact, the analyses show that there is very little, comparatively little, purification in cold water, when the temeprature of the water is cold, at the freezing point and especially when the rivers are covered with ice.

CROSS-EXAMINATION, by Mr. Johns.

Q. How long had you been in St. Louis before you commenced these chemical analyses?

1758 A. I first came to St. Louis in June, 1899, and made a chemical analysis beginning on the 24th day of January, 1900.

Q. You did not then arrive here in the fall of 1899?

A. No systematic analyses—

Q. I beg your pardon. I am asking you as to the time of your coming here. When did you arrive in the City of St. Louis and take up your duties as a chemist?

A. September 20, 1899.

Q. In what capacity did you then pursue your profession?

A. As a Professor in Chemistry at Washington University.
